Of course, the examinations vary widely, according to the department which the candidate proposes to enter. There are some subjects proposed for all; the candidate is required to show, by his handwriting, that he possesses the first necessary qualification for a useful clerk; he is also tested in geography, grammar, and history, not that he will have need of these so much as that a knowledge or ignorance of them betrays a good or a bad general education. But, otherwise, the great variety of public departments implies as wide a variety of the work to be done, and of special qualifications for doing it. In some of the departments, "even the senior clerks of thirty years' standing are engaged in nothing but mechanical work, requiring patience, steadiness, attention, trustworthiness—and nothing more." In others, the "junior" clerks, those who have just entered the service, are set to performing tasks which require rather the intellectual qualifications of judgment and caution. A single kind of competition is therefore quite impracticable for the whole civil service. We may take a single instance, to show the general tenor of the examinations. Candidates for clerkships in the Admiralty are examined in writing from dictation, arithmetic (including vulgar and decimal fractions), English composition, *précis* translations from Latin and some one modern foreign language, geography, English and general history, algebra, and Euclid. Candidates for the colonial office, in addition to these, must pass in colonial history, in French, German, Spanish, and Italian, in

constitutional and international law, and in political economy. Candidates for consulships are tested in arithmetic, composition, French (written and spoken), the language of the port to which the consul is appointed, and British mercantile and commercial law. The British consuls are thus, from the start, competent to proceed to their posts, and enter at once upon their duties with understanding and effect. How different this is from our own consular appointments, any one who knows any thing about our service will recognize at once. Our consuls are not only not required to know the language of the country to which they are accredited, but they may even be ignorant of the elementary rules of international law, and may be wholly innocent of even school-girl French, a language used in every town in Europe as a common medium between foreigners and natives. And, as a fact, very many of our consuls are wanting in these vital qualifications, and depend on others, vice-consuls and clerks, to be the interpreters of the communications with local merchants and officials. The result is, that in many European cities, where there are corps of fifteen or twenty consuls at a place, the American consul is the only one who cannot converse in its language—Persian and Egyptian consuls being more accomplished than he in this respect. Europeans regard the fact with astonishment in the representative of a nation boasting to possess a leadership in civilization, and find it difficult to appreciate the fact that consuls are actually sent out without any examination whatever.

Candidates for clerkships in the British Foreign Office are required to know French, but not mathematics; the case is exactly *vice versa* in the revenue offices. These examinations are all by means of printed papers, to conclude the answers to each of which a certain time is given to the candidates, corresponding much, in these respects, to the examinations for admission into our own larger colleges. As to the ages, the limits of these differ widely according to the department and the work. Candidates for admiralty (navy) clerkships must be between seventeen and twenty-five, and this is the limit for the ordinary clerkships in most of the departments; audit-office clerks must be between eighteen and twenty-five; assistants at the British Museum (which is regarded as a government office), between eighteen and thirty—junior-assistants, between seventeen and twenty-five; consuls, between twenty-five and fifty; *attachés* of legation, between twenty-one and twenty-six; messengers in the departments, between twenty-one and thirty-five; House-of-Commons clerks, between nineteen and twenty-five. The latter, by-the-way, are examined severely in comparisons of copies with originals, in the history of the English constitution, and in the law of evidence.

As to the salaries of British civil servants, a very large proportion of the junior clerks—which is the designation of those who have just entered upon the service, and have the least responsible work of their department—at first receive £100 a year (\$500). This is, however, but a beginning, for the British system makes what must be regarded as an admirable provision for gradually and *regularly* increasing the salary as the clerk advances in time and proficiency. The junior, or fourth-class clerk, beginning with £100 a year, has an increase made to his salary every year after the first, of £10 a year, until it has reached the limit of £250 a year. More than this: in order of seniority—if the clerk maintains his proficiency—he is promoted from a fourth to a third, a second, and a first class clerkship, and often even to a secretaryship of his department.

Thus he may in time rise from £100 to £2,000 a year. The *third*-class clerks begin with £250, rising by £10 a year to £350; the *second*-class clerks begin with £350, rising by £15 a year to £550; and the *first*-class clerks start with £600, rising by £20 a year to £850. The First Lord of the Treasury (who has always been, in recent years, Prime-minister of England), receives a salary of £5,000 a year; the Chancellor of the Exchequer, and Home, Foreign, Colonial, War, and India Secretaries of State (cabinet ministers), also receive £5,000; the Lord High Chancellor receives £10,000; the Lord-Lieutenant of Ireland receives £20,000 (to keep up viceregal state at Dublin Castle), and about £2,000 for carriage outfit; the Lord-president of the Council, Lord Privy-seal, Chancellor of the Duchy of Lancaster (ornamental offices of state), receive £2,000; the Secretary for Ireland, £4,000; the Commander-in-chief, £3,460; the Postmaster-General, £2,500. As for the under-secretaries of the departments (corresponding in some sort to our assistant secretaries and chief clerks), they are divided into two kinds—political and permanent under-secretaries. The political under-secretaries are temporary, party appointments, are members of

one House or the other of Parliament, representing their departments in the Legislature, and intrusted with the political details of their departments—with drawing up bills of administrative reforms, proposing changes in the laws, and so on. The permanent under-secretaries, as their designation implies, are non-political, non-removable at the change of a ministry, and superintend the routine of duty in their respective departments, holding office during good conduct. The permanent under-secretaries, for the most part, receive a salary of £2,000 a year; the political under-secretaries, a salary of £1,500; and, in one or two cases, £1,000 a year. Chief clerks receive, on the average, £1,000 a year. The principal librarian of the British Museum receives £800 a year. In the diplomatic and consular service, five first secretaries of embassy receive at first £1,000 a year, rising to £1,818; nine secretaries of legation receive £665, rising to £1,341; eight second secretaries of legation, £300, rising to £570; ten first-class consuls from £1,100 to £1,800; sixteen consuls not over £1,000; twenty-nine consuls not over £800; fifty-three consuls not over £600; eighty-four consuls not over £400; and sixty-five consuls not over £200. It will thus be seen that there are in the British service two hundred and fifty-seven consuls, and twenty-two secretaries of embassy and legation; while in our own service there are three hundred and eleven consuls-general, vice-consuls-general, consuls, deputies, and commercial agents, and seventeen secretaries of legation.

The certificate of the civil-service commissioners is the authority of the departments for employing and paying the successful candidate. The hours of work are, in most of the departments, from ten till four; in some of the higher offices, from eleven till five. All the members of the civil service have an absolute right to claim an annual vacation. In some offices the vacation allowed is two months, in others one month. Consuls to China, Japan, and other far-distant countries, are allowed a vacation of one year after three or four years' service, to enable them to return to England if they wish. Besides the summer vacations, the clerks have many more holidays in the course of the year than do the employés of our own departments. The British civil-service further differs from that of the United States, in its system of pensions. After a service of ten years, the clerk, whose conduct has been satisfactory, becomes entitled to a parliamentary right to the "benefits" of superannuation. The sum allowed on this score is one-sixtieth of his latest salary for each year of service up to forty years. This may be claimed at any time within ten years in case of ill health, and without this excuse, if the claimant be over sixty years of age. For example: a clerk entering the service at twenty years of age, and serving till he is fifty, who then retires on account of ill health—if his salary is £600—will receive £300 a year for the rest of his life. But this system of pensioning, which in certain cases and under certain restrictions, would doubtless be for the good of the public service, is carried in England to an extravagant extent. It is not at all likely that, were the pension system proposed at this day for the first time, as a new feature of administration, it would be adopted by the English Government to any thing like the extent to which it prevails in that country. The system—especially as relating to the higher state offices—has come down from times when the public money was used to enrich noble families, to corrupt party leaders, and to reward the favorites and mistresses of kings. An instance of this is the pension, still enjoyed by the Dukes of Grafton, awarded out of the proceeds of the post-office revenue as a perpetual charge by Charles II. to his mistress, the Duchess of Portsmouth, the ancestress of the Grafton family; and which the Duke of Grafton of the day receives regularly without the least compunction, apparently, or the least idea that he is taking any thing that is not perfectly just and proper, and due to him.

The ex-Lord Chancellors receive pensions amounting, we believe, to £2,000 per annum for life—although they may only have sat upon the woolsack six months, and then given way to a rival of the opposite party; and, besides a salary of £10,000 in office, and a pension of £2,000 out, the chancellor is allowed some £2,000 for "outfit," whatever that may be. The English ambassadors to foreign courts are treated with equal lavishness out of the taxes of the people. The ambassadors are provided with palatial mansions, profusely furnished and fitted, at the national expense; with horses, carriages, liveries, secretaries, chaplains, and servants, and now and then bills come into the Exchequer for "refitting." Every consul has a goodly sum allowed him for "outfit," and, after a certain length of service, a pension. We find a charge of £6,000 for "legation guards to protect our representatives in China;" and £95,000 expended on the consulates in

China and Japan. Much of the same character are such charges as these, which show how lavishly English money is spent upon the highest personages, to the detriment, clearly, of the millions of *lowest* personages: "For conveying the Prince of Wales and Prince Christian across the Channel from Dover to Calais, £394; for investing the Prince of Wales with the Order of the Garter, £1,500; for investing Prince Arthur with the Order of the Thistle, £270." It must be remembered that these sprigs of royalty have all magnificent allowances out of the public funds, and that these items are simply "extras." And it is curious to observe that the most liberal of English premiers, Mr. Gladstone, eloquently defends these items in the House, against the criticisms of uncomfortable radicals like Professor Fawcett.

In conclusion, we may quote, on the subject of the general efficiency of the British civil service, and especially on the practical working of the examination system, the testimony of one who has had, perhaps, better means of judging of both than any Englishman living. Mr. Hammond, the permanent under-secretary of the Foreign Office, in the course of his examination before a committee of the House of Commons appointed to inquire into the diplomatic and consular service, in answer to a question, "Have you found the examination systems to work well?" said: "Since they have taken effect, we have obtained in the service most able young men, whose conduct has been highly satisfactory. There is no greater trial of a young man's abilities than to put to the test his power of concentrating, in a small space and with great rapidity, masses of information such as are constantly required. Nothing has given me more pleasure than to find, after I have signed the promotion of a junior, that he has been able at once to undertake the higher duties of a senior. We take the measure of each man without any difficulty, and, knowing the high character of all our servants, both at home and abroad, I should be sorry to take any other measure. If any young gentleman did not manifest quite so much industry as it was thought he ought to do, means would be taken to convey some hint to him; but it would be a very extreme case in which I should think it necessary to make an official communication to him."

GEORGE M. TOWLE.

MOTION AS AN ORGANIC AGENT.

AMONG the modern changes in scientific theory there are none more radical and significant than the new views concerning motion.

Matter was, of old, credited with various inherent forces, considered as essential properties of rigid atoms, or, in other cases, as ethereal fluids, whose interaction gave rise to all the phenomena of Nature. It is now known that many of these forces are simply modes of motion, and we are rapidly approaching the position that matter is but an inert vehicle of motion whose various forms produce all the natural forces.

This view has been established, almost beyond question, in relation to light, sound, and heat, and little doubt is entertained that electricity and magnetism are similarly produced. There is little of special property in matter that may not result from some action of these forces, with the exception of gravitation and its various results. Yet so deep a thinker as Faraday considered gravitation a motive force, and made many futile efforts to prove it.

If, then, motion is of so essential importance in Nature, it is desirable to view it in all its possible relations. A glance at this subject shows that motive force is capable of assuming several distinct conditions, produced by the compounding of simpler conditions. The primitive form of these is direct motion, the tendency to move in straight lines. Outward forces acting on this tendency modify its results, changing the direct into various forms of curved and vibratory motion, and thus producing the ordinary conditions of inorganic Nature.

In the magnet we have an advanced condition of motion, a cylindrical motive agency, its active forces internal and referred to a central axis. In the galvanic battery motion is displayed under a third aspect. The active agency here moves outward from and inward to a fixed centre of influence, and conducting-wires might be so arranged as to produce a complete vortex of force. Thus we may view the galvanic force as internal, and referred to a central point. These classes of motion, though simply complex forms of the action of

force on straight lines of motion, must, by their special arrangements, yield distinct classes of effects.

May not the three great provinces of Nature arise from the action of these three modes of force, curved and vibratory motion being the agency in the inorganic, cylindrical motion in the vegetable, and vortical motion in the animal conditions of matter?

Direct motion, in its simpler modifications, certainly accords strongly with inorganic phenomena, and we design to show that the characteristics of the two organic kingdoms present strong points of analogy to magnetic and galvanic action. We will glance at some of the more obvious of these characteristics of organic Nature.

The primary form of the vegetable is a cylinder, the exact shape which would result from magnetic forces strong enough to mould their vehicle. The accepted hypothesis of magnetism considers each molecule as affected by circular currents of electric force, whose mutual action produce a central line of force, and must produce a complete cylinder in all matter of sufficient mobility. Such a central axis is a marked feature of the tree.

The action of the magnet is to produce magnetic poles in other matter, and to attract the unlike poles, preference, however, being shown to certain substances, while others are repelled in every case. So the tree attracts matter by its air and its earth poles, showing this same property of preference for certain substances and rejection of others.

The earth-pole may be viewed as polarizing certain aqueous solutions, which are attracted toward and absorbed at the roots, while the special attraction of the upper extremities, when intensified by sunlight, is sufficiently vigorous to decompose carbonic acid and absorb the carbon. May we not view carbon, thus absorbed by the leaves, as held in solution by the sap? Dissolved carbon has never been produced chemically, thus leaving us free to conjecture that such a solution of this stubborn element in a peculiar fluid may be the natural agency for the formation of the carbo-hydrates and other more complex vegetable compounds. The nightly inhalation of oxygen assimilates the plant to the animal, the free oxygen breaking down the carbon compounds, and yielding force for the formation of the higher vegetable products, precisely as occurs in the animal body.

The branching of the two extremities of the tree is possibly a realization of the magnetic tendency. We have something similar in the branching of the electric glow and flash, in the formation of hoarfrost and similar chemical phenomena, which probably result from electric action. Faraday supposed the electric current to possess a transverse force of the nature of magnetism, so that in the current we may have a display of mobile magnetic action. The magnetic lines of force, as displayed by iron filings, branch out in every direction from the poles. Suppose a magnet, whose poles are surrounded by spherical caps of iron, to be permeated by fluid magnetic matter, flowing toward its surface. This matter, solidifying on the surface, would necessarily grow out in branching lines toward the iron caps.

The poles of the tree are surrounded by two such attracting and attracted caps, and the trunk is permeated by fluid which solidifies at the surface, and particularly at the extremities. The natural result is a branching growth toward every point of these fields of attraction. The positive movements of the root toward food, of the branch toward light, clearly indicate such attractive agency affecting the direction of growth.

The pointed shape of the twigs is a natural result of this growth toward points of attraction. The spiral vessels of the trunk remind us of the helix, and may result from the interaction of magnetic force with the upward flow of electricity.

Little is known of the action of force in the interior of the magnet, though there is reason to believe that lines of force act outwardly from the axis through the circumference. Viewing the tree as a mobile magnet, this outward action from the axis may be represented by the medullary rays of wood which proceed from centre to circumference; while the formation of buds and branches where these rays touch the air seems a natural action of an outward line of force. We must view the tree as possessed of a native outward force, whose direction and vigor of action depend on the direction and energy of outward-force relations, precisely as in the magnet, whose force acts inwardly when not attracted outwardly.

In the animal there is yet stronger evidence of a vortical motive-force, the animal being an eddying outgrowth from fixed centres, as

was the tree a branching outgrowth from a fixed axis. Every separate organic agency of the body is a true vortex. Thus the circulation is a vortical current with the heart for its centre, while the lungs form the centre of another vortex. Or we might view the pulmonary circulation as a double vortex, with the heart and lungs for its centres, or polar provinces, the lungs attracting oxygen, the heart carbonic acid. In this view the vortical is but a progressed form of the magnetic action.

The tree presents a differential action between the leaves and the root, each extremity absorbing and passing toward the other different kinds of matter, which, from their powerful affinities, seem to possess opposite polarity.

So in the circulation of animals a differential action takes place between the centre and the outward swell of the vortex, oxygen passing in one system of tubes from the lungs, through the heart, to the capillaries, and carbonic acid, in another system, from the capillaries to the lungs—this differential action and attraction of one substance to, another from, the centre, being possibly an important agency of the circulation. In the extensive circulation of the vertebral animals this agency may yield little more than directive power, it being aided here by the action of the heart and arterial muscles and by the valvular formation of the veins.

The nervous circulation is a similar vortex, the brain its centre, the nerve-current eddying outward to all the extremities of the body and in again to the brain. Here also we may consistently expect some differential action, but too little is yet known of the character of the nerve-action to enable us to discover opposite conditions in the two sets of nerves. Certain apparent differences of formation seem to argue such distinctions in action. The sympathetic nervous circulation is another vortical arrangement, and every ganglion in the body a secondary nerve-centre of action, while in the general system the various glands may be each a secondary centre of vortical force, and the actions of the stomach and intestines less-developed forms of the same relation.

The bony frame of the animal is built on a similar principle, each vertebral bone being a double vortex in shape, while the whole vertebral column assimilates the animal to the tree in presenting an axial combination of vortical centres. In the animal-limbs this tendency to reversion to the vegetable form also appears, the essential distinction being maintained, however, in the rounded form of animal as compared with the pointed form of plant extremities.

In the lower forms of animal life we may view the articulate as an axial combination of single vortices, the mollusk a simple vortex of circulation and nerve-action, possessing in its higher forms the spiral force of the magnetic helix, while the radiate is a vortex of circulation, its forces having the simplest form of arrangement. In the higher animals the regularity of the simple radiate system is modified by their possession of several distinct vortical systems with separate centres, thus producing irregularity of form. The higher vertebrates present the most complex combination of these separate force-centres, and hence the greatest variation from the simple globular form, yet the tendency to assume this form is displayed around all immediate centres, as in the head, the lungs, etc.

In the lower radiates the branching force of the plant is strongly displayed. Going yet lower, into that mysterious region where only microscopic forms reveal the existence of life, it becomes often impossible to distinguish between the animal and the plant. Possibly there is a regular gradation between the two, the axis of the plant being gradually reduced to a central point, and thus passing insensibly into the animal force-centre.

The simplest form of both animal and vegetable life is a single cell, displaying similar properties and increasing in similar manner with the cells which build up higher organisms. Hence some naturalists have concluded that these latter are really living individuals, and that a complex animal is but a social community of living beings, each composed of a single cell.

Each separate cell, then, should be an epitome of the organic kingdom to which it belongs, the animal-cell being a vortex round a central point, the vegetable a circulation round an axis. The outward resemblance between these two classes of cells is great, yet the animal presents some phases of internal action not usually displayed by the vegetable, which may result from this superior force-condition. We may also suppose that in the vegetable fruit, in whose formation the animal absorption of oxygen and excretion of carbonic acid is

displayed, we have a progression from the vegetable into the animal condition, so that our ordinary vegetable food possesses really more of the animal than of the vegetable in its nature. The globular form of fruit seems to sustain this idea.

We then may view the animal-cell as a vortical arrangement, taking in matter at every portion of its circumference, its centre being the interior of the nucleus. A differential action operates between the nucleus and the periphery, the latter drawing in certain matter by osmotic force, the former reorganizing this matter, expelling a portion of it which is excreted at, or accumulates around, the surface, and retaining the remainder, which causes the growth of the cell, and, by the formation of secondary centres, produces division and reproduction. The varying position of the nucleus in respect to the centre may result from variations in the supply of nutriment to the different portions of the surface.

In the vegetable cell we may have an axial arrangement of force such as we have supposed in the tree, matter being drawn in at one pole, changed in the interior, partly excreted at the other pole, and partly used to build up the cell. Or, it may be that each pole draws in a different kind of matter, one the solution from the root, the other that from the leaves, which meet and combine in the interior. In this view each cell is a miniature galvanic battery, producing peculiar and vigorous arrangements of chemical affinity, and thus forming complex compounds not readily formed by ordinary chemical agencies.

We have but glanced at this subject, which presents many other points of curious accordance with the idea here presented, but hope we have presented sufficient analogies to render it not wholly unacceptable.

CHARLES MORRIS.

ILLUSTRIOUS OLD MEN OF 1871.

FOREMOST among the European old men of mark who have turned the corner of 1870 into the new year, is FRANÇOIS PIERRE GUIZOT, last October eighty-three years old. Professor of History in the Sorbonne, Councillor of State of Louis XVIII. and Louis Philippe, ambassador to the court of St. James, and holder of the portfolio of Foreign Affairs during the last six years of the king of the French; renowned as a scholar, successful as an advocate, persuasive beyond all his contemporaries as a speaker, and upright as a judge—a politician above low trickery, unsurpassed in sagacity as a statesman, shrewd among *diplomates*, and, as a leader of party in place or opposition, unrivalled—M. Guizot has witnessed all and taken part in most of the political changes of his country during the century. It is twenty-two years since he withdrew from the stage of public affairs, and yet in these two decades he has won distinction as a philosophic writer, and reputation as a scholar, more eminent, perhaps, than any *savant* in Europe. That he has kept still during these fateful days for his country, is due partly to his age, partly to his unpopularity, and, in a still greater degree, to his excessive caution.

When young Guizot came up to Paris in 1805, Pauline de Meulan was the popular contributor to Suard's newspaper, *Le Publiciste*. Falling into deep affliction, she was surprised to receive a letter without signature, and in an unknown hand. The writer did not wish to give his name, but said he had heard of her illness, and begged to be allowed to supply the articles she had engaged to write, so long as she felt herself unequal to the task. She at first refused, though touched by the delicacy of the proposal; it was renewed with more earnestness, when, charmed by the candor of the offer, she accepted it, and was supplied from time to time, by a secret conveyance, with such articles as she had no reason to regret publishing in place of her own. In the mean time the mystery continued, until, failing to penetrate it, the lady declined to continue under such obligations unless her wary correspondent would give his name. He yielded, and Mademoiselle Meulan thus became acquainted with her future husband. M. Guizot was at this time only twenty years old, and was immersed in his studies, preparing to make a name for himself some day in the literary world. Five years after this occurrence, which partook more of romance, perhaps, than generosity, the lovers were married; and, though the lady was more than fourteen years the senior, no wedded life was ever happier—no wife's influence more salutary during their fifteen years' union.

Withdrawn from all contact with politics, Guizot has grown old gracefully during the second empire, shut out from the noisy world pursuing his studies within the retreat of his library, and winning new honors as an historian and philosopher.

Next to Guizot, older in years, if not in honors, advances EDWARD BURTON SUGDEN—Lord St. Leonards of the House of Peers—the great chancery lawyer of England. He has outlived all his contemporaries—Aberdeen and Palmerston, Brougham and Lyndhurst, Cranworth and Campbell, and yet, at the age of ninety, holds his own with the youngest and wisest in the House of Lords. In that profusely-gilded chamber, a spectator from the gallery may have seen, at any time this present winter, a brisk old man, small, bent, and weakened, passing toward his seat, nodding recognitions, bowing profoundly to the occupant of the woolsack, dressed in black, with the profuse white neckcloth of the regent's days, scrupulously neat, his face clean shaven, and locks white as snow falling upon his shoulders, the observed of all observers among bishops and lords, royal dukes and princes of the blood. He has held position as equity lawyer, unequalled in the United Kingdom. Wellington made him solicitor-general, and Peel Lord-Chancellor of Ireland. Under two prime-ministers he was keeper of the great seal. Since the days of the Conqueror, no other barrister has thrice declined the highest gift the sovereign can offer a member of the bar. For thirty years he was the leading counsel in the great Court of Chancery. More than all other men of the century, he has contributed to simplifying law, reducing costs in courts, remedying vexatious delays, securing titles, abolishing useless forms, and making the House of Lords efficient as a judicial tribunal.

They tell endless stories upon the circuits of his forensic contests with Brougham. The two were almost always pitted together. Brougham was only three years the senior. He had been the more fortunate, and was first upon the chancery bench. Sharp contests had often taken place between them as rivals, and it was natural enough that the exchange of the gown for the ermine should not have commanded from Sugden all the deference to which Brougham, the judge, was entitled. During an argument upon a question of law before the latter, Sugden suddenly ceased, gathering up his papers with the remark:

"I see your lordship is engaged in writing letters, I will therefore postpone my argument."

"Writing letters!" responded Brougham; "I am merely jotting memoranda. You might as well complain of my blowing my nose. Go on, Sir Edward."

At another time, when both were in Parliament, in the heat of debate, Brougham had designated Sugden as a "bug"—a word which, in our American use, loses its sting—and then, with an air of inexpressible loathing, had proceeded to describe his crawling ways and venomous propensities. Sugden did not immediately reply. But when the time came, a few days afterward, his answer to the outrageous attack, from his place in the House, has not its equal for keen invective and bitter satire in parliamentary annals. He laid open the anatomy of his opponent's character with a skill and coolness that won the applause of all England. Then came Brougham's better nature. His apology at the club was as generous as his assault in the House had been mean. Gathering himself up, half averting his face, and offering his hand to Sugden, he said: "When a man has done wrong, Sir Edward, he cannot acknowledge it too soon." The reconciliation was complete.

Lord St. Leonards retains his mental powers apparently undimmed. In his "Review of Lord Campbell's Lives of Brougham and Lyndhurst," published two years ago, there is, without prolixity or prosiness, narrative, anecdote, analysis of character, chatty and undidactic description, and genial, good-tempered talk in the best of clear, pithy, and pungent English.

Very unlike the great equity lawyer, and even more unlike his old opponent, the statesman and scholar first described, is the third old man upon our list, LOUIS ADOLPHE THIERS. Sixteen years the junior of Lord St. Leonards, and ten years of Guizot, the public life of the great Orleans minister extends, nevertheless, over almost as broad a space of time. He was a power in the opposition that drove Charles X. into exile. Talleyrand recognized him as the *parvenu* Brutus of young France. From the day of Louis Philippe's acceptance of the crown in 1830, until his inglorious flight, Thiers was leader of the Orleans party. During the last seven years of the second empire, he was the strongest man in the Chambers. There is scarcely a public work of the last forty years in all France—roads, canals, railways

telegraphic lines—the statue of the first Napoleon on the Place Vendôme column, the completion of the Church of the Madeleine, the erection of the Arc de Triomphe, the organization of the navy, and the promotion of public industries—in which he has not had a hand. The judicious friend of popular freedom when the minister of the crown, he, with the forty members of the extreme Left who have monopolized the brains of the Chambers for the last half decade, has always been a champion of the liberties of the people.

Thiers is nevertheless, while perhaps the greatest orator France has ever produced, one of the most uncertain of statesmen. The essence of mind to the tip of his lips, he is the very vapor of character. To the wisdom of a philosopher in argument he adds the frivolity of a child in action. His whole political life has been a continued series of feverish fits and nervous attacks. He has the reputation of constant insincerity. Honest convictions no one believes him to entertain. Opinions seem to pass through his mind like water through a sieve. And yet, in spite of all this cloud of doubt through which all men view him, in spite of his constant mockery, in spite of his half-deformed person, frail organization, feeble presence, nasal twang, slovenly dress, and repulsive manner, his intellect, elastic as the finest steel, his power of persuasion, that spreads the way he leads with flowers and pearls of thought, his transparency of language, vividness of description, sententiousness of statement, liveliness of narration, and cogency of argument, carry with him, almost irresistibly, both friends and foes. Cormenin, his bitterest satirist, said of him: "He thinks without effort, produces without exhaustion, advances without fatigue, and arrays his ideas before you with a rapidity which is inconceivable; former times pass before his memory in their order and proper costumes; and Nature, which others court, comes to him uninvited in all the pomp of her majesty, and all the grace of her smiles."

Age has not improved the personal appearance of M. Thiers. A little old man, erect in carriage, looking his listener full in the eye, and at the same time nervously active while addressing him; his clothes too large, his cravat awry, his boots unpolished, awkward in manner and ungainly in figure, constantly in motion, neither deferential nor rude in address, listening with patience, but taking the thought in his reply with such volubility of sense that no rejoinder is possible, he impresses you as a man so wholly *sui generis*, that you are compelled to yield to his opinions. Once started in conversation he never stops. "If the Almighty had foreseen," said one of his opponents, "that the day would come on which He would create a Thiers, He would undoubtedly have made the earth turn on its axis in forty-eight hours instead of twenty-four."

Almost any winter morning of the last twenty years, between the hours of six and eight, there might have been seen striding at rapid pace along the streets of Chelsea, making way toward the suburban villas that there introduce town to country, a man of large head, large body, and large limbs, a heavy man in gait, who, old as he is, with very slight attention to the choice of his dress, would be universally regarded as handsome. It is THOMAS CARLYLE. Rubens would have gloried in him as a model. With grizzly beard, long locks of white hair, shaggy brown overhanging eyes of extraordinary brilliancy, a seamed and scarred face ploughed deep with wrinkles, and stooping a little as he walks, you might think, but for his *outré* dress, you had before you some magnificent old feudal baron. His coat, large and loose, might fit a giant; and his trousers are two sacks joined at the upper end. At each long stride he disposes of nearly a yard of ground, and he bears in his hand, wherewith he strikes the ground as if with a paving-rammer, something between a stick and the trunk of a tree, a sort of gigantic club, the like of which for size you would hardly find in Tipperary. He looks like Fee-fi-fum come out for his morning walk, or an ogre seeking his breakfast.

Without good reason, one would not care to address him as he strides along, but when he does talk, as talk he can in Saxon idioms and Saxon words when occasion requires, his voice is gruff and toneless, coming from the recesses of his beard like the growl of a bear from the bush. But his language is simple, his sentences short, and he always speaks his convictions. Like every man who has thoroughly made up his mind, he declares it without circumlocution; but, unlike most men, he rarely reasons with those from whom he differs. He is not affable—certainly not of late years. His talk is short, continuous, and emphatic, and, toward strangers, likely at any moment to suddenly

stop. It has been compared not inaptly to the spring of a clock running down.

To analyze or even sketch the character of Carlyle, will not be attempted here. The *sticket* minister who came to London from Craigenputtock, "the loneliest nook in Britain, fifteen miles northwest of Dumfries, among the hills and black morasses, which stretch westward almost to the Irish sea," nearly forty years ago, and in his "Sartor Resartus," upon the homely topic of clothes, brought together much of the deepest speculation, finest poetry, noblest morals, and wildest humor, that this or any other age has produced, and has followed it by other numerous works equally strange and brilliant, has not yet found the undisputed place he is to occupy in the literature of England. That his genius will never want ample recognition is certain; but his writings derive so much of their interest from time and manner that it is impossible to predict how they will be relished in the future.

Mr. Carlyle shows his age in mind as much as in body. The strength in both remains unimpaired. But some of the parts are indurated. Incrustations have grown upon the surface. He is opinionated and irascible. The heaviest blow of his life—the sudden death of his wife during his absence from home some years ago—upset his temper beyond recovery. He has grown old more rapidly since he reached seventy, in 1866, than during a decade previous. But for his firm step and active movements, he might well be taken to be past fourscore.

The little old man, precise, exquisitely dressed, and nervous, who is never absent from his seat, and who, as you look at him from the gallery of the lords, is always busy writing, if not speaking, is Earl Russell, better known as Lord JOHN RUSSELL, the octogenarian, who has been fifty-eight years in Parliament, thirty-three years in place, six years prime-minister, and is the illustrious younger son of the great house of Bedford. He was Home Secretary under Melbourne, and Minister of Foreign Affairs under Aberdeen; Lord President of the Council in 1854, and Colonial Secretary under Palmerston; leader of the Reform of 1832, and ambassador to the Vienna Conference in 1854; measuring swords in debate with Grenville and Canning, Earl Grey and Sir Robert Peel, Huskisson and O'Connell, Wellington and Lord Derby; the personal friend of Lord Byron and Sir Walter Scott, Shelley and Coleridge, Tom Moore and Sir Humphrey Davy; and the literary author of lives, memoirs, essays, and tragedies innumerable. Without extraordinary talents, wanting the advantages of person and presence; possessing in no degree the suavity of Lyndhurst, nor the force of Brougham, nor the logic of St. Leonards, nor the readiness of Palmerston, nor the oratory of Peel, nor the silver voice of Melbourne, with each one of whom he contested for the highest honor within the queen's gift; lacking by Nature the force, enthusiasm, brilliancy, and forecast, that made his contemporaries famous—he has succeeded, by simple industry, added to the advantages of family, in keeping his name familiar as a household word, for nearly half a century, in Europe and America. There was never a more drowsy speaker. His state-papers consist of the dreariest platitudes. He possesses learning without knowledge, argument without logic, politics without statesmanship, and power of debate without appreciation of the merits of the question discussed. England, the foster-mother of aristocracy, does not show, in her millennial annals, one such other notable example of the advantages of noble birth.

When Daniel O'Connell, taunted by Lord John that he had caused a death's-head and cross-bones (in that day fatal warning in Ireland) to be chalked over a refractory tenant's door, replied, "Death's-head and cross-bones? What can a son of Bedford know of these, when his best inheritance is *calves-head and jawbones*?" The House was convulsed with laughter not more by the drollery than the pertinence of the reply. "What then is an aristocrat in disguise?" asked Disraeli, in answer to Lord John's taunt. "It is a Whig in place—a man who owes his position to promises to the people which he has paid in performances to the lords," and the noble accuser had not a word to say.

And yet the club-house anecdotes of Earl Russell do not always exhibit him as dull. Upon leaving Devonshire House after dinner, he gave the usual "*vail*" (*vale*, farewell) to the servant who handed him his hat. "Your top-coat, my lord," said a second servant, who also received his shilling. "Your umbrella, my lord," said a third, who fared the same. "Your cane," "your goloches," "your gloves, my lord," repeated other servants, waiting the accustomed *douceur*, when

Lord John replied, "You may keep all those, they are not worth three shillings."

In the memoirs of Thomas Moore, published some five-and-twenty years ago, may be seen the portrait of Earl Russell, as he desired, at that time, to be presented to the world. The precise attitude, dignified manner, composed features, and aristocratic bearing, which appear there, may still be recognized in the black frock-coat, white neck-cloth, ruffled shirt bosom, polished boots, and Jouvin gloves of the little old man seated among the peers, and bishops, and law-lords of the Upper House of Parliament every night of the season. The step is less elastic indeed, and the voice pipes and whistles, but the veritable member who represented London for almost an ordinary lifetime, is still there, with enough of life apparently left to carry him over a half-score and more of coming years.

N. S. DODGE.

"DROPPING OFF"—A SKETCH BY EASTMAN JOHNSON.

IT is worth while to enlist the authority of John Ruskin for a form of art that has been commonly despised by his narrowest readers—we mean by those who have been exclusively impressed by his lessons about "lovely detail" and "finish;" who seem to think "sketch" is another name for laziness or ignorance.

In connection with the effort made at the spring exhibition of the Academy of Design, to interest the public in the sketches and studies of painters, we may begin to understand that the best art-culture is most hospitable and intelligent in its reception of a true sketch. Ruskin tells us that *incomplete pictures* ought neither to be purchased nor produced, but that careful and real sketches ought to be valued much more highly than they are. "Studies in chalk, of landscape, should form a part of every exhibition, and a room should be allotted to drawings of figures in the Academy . . . not blots of *chiaro-scuro*, but delicate outlines with the pen or crayon." We are not pleading for any crude or ignorant form of art: yet, we are as far from limiting the idea of a sketch to "delicate outlines with pen or crayon" as we are from accepting "blots of *chiaro-scuro*" as sketches. We mean by sketch the work a painter does, honestly, *from Nature*—never retouched for the sake of finish, or at least never retouched without Nature to determine the touch. Such a sketch we had the pleasure of seeing, some time ago, in the studio of Eastman Johnson. No finished picture by this artist holds a higher place in our judgment than this slight but admirable example of his talent; in it, the artist has caught, with a delicate and sympathetic and vital and intelligent touch, the most fleeting and indefinable traits of Nature, and in a fashion beyond the reach of a copyist, beyond even the possibility of duplication by his own hand. If, in some bad hour, the artist should retouch his sketch, we believe one of the finest specimens of his art will be hurt, if not lost.

The sketch of which we speak was probably made, in one sitting, from a very, very old man, in a country home. It represents an old New-England veteran of the rugged soil, yet living, but so old, so weak, so frail, that life in him seems barely to flicker in its time-worn socket. To paint this old creature, to place him before us in a manner to inspire interest, to make upon us the impression of reality, to give precisely the book of life without reaching realism through the effect of a photograph—this is no common result; in fact, to reach it, a genius akin to the greatest master, to Rembrandt, was needed. Now, Eastman Johnson falls short of the tremendous power of Rembrandt; but in this sketch he approaches some of the qualities of the great Dutchman by the delicate and easily-expressed vitality of his sketch from Nature.

We are attempting to help you enjoy, by the means of words, what we enjoyed by the direct means of Eastman Johnson's art. We have the advantage in vividness of impression. But look with us, if you can, yet more at this remarkable sketch. We were told it should be called "Dropping Off." Dropping off into the easy sleep of second childhood? or into the last long sleep that is next to each one of us? Dropping off! Poor old man, at the end of life, at the end of the seasons that come and go with the varied music, and perfume, and color, and splendor of life! At the end of *sensation*! the supreme fact of the supreme hour of life!

Just observe the peculiar shape of the old man's head. How high and narrow the skull! The New-England head in excess. His white, thin hair lies lightly. Feeble and exceeding old he seems; yet how ruddy, how fresh his wrinkled cheek! Time is the last friend of this old man, and yet he is dropping off even from his first and last companion.

The artist knows very well that this sketch is a masterly representation of Nature. When our picture-buyers are instructed lovers of art, they will covet such a slight but perfect specimen of painting, as now they covet elaborate pictures, in which the details and finish of a mechanical industry, or the general effects of a trickster in painting, make them marvel about the imitation of Nature and the interpretation of art.

Since Ruskin began his crusade against the inane effects, the blotchy and spotty manner of the degenerate successors of Reynolds and Gainsborough, public taste has obeyed in a large measure, and even exceeded, his ideas of reaction against whatever seems careless or slight. Now, we have not, as picture-buyers twenty years ago in England had, a too great fondness for unfinished works; we have a too great fondness for a smooth surface in a frame full of details, in our encouragement of what we call art. Half an hour before Eastman Johnson's sketch would teach us more of art than any photograph, more than any painting that indicates its idea of Nature as, in part, the product of the photograph. It is in just such bits of the actual, as Johnson's sketch, that we can learn to appreciate the qualities and traits that distinguish art from imitation, that teach us the natural is better than the real in art; for a photograph gives us the real, but it is not natural, for it misses just that inexplicable sense of the color, the breath, in a word, the *life*, that makes Eastman Johnson's "Dropping Off" so surprising and so satisfying to the most instructed sense of art and Nature.

It is to be hoped that the next spring exhibition of the Academy of Design will be graced with this specimen of Eastman Johnson's honest and admirable work. We have no painter more faithful and sensible in the rendering of American, or rather Yankee character. He seems to enjoy depicting just such homely, and shrewd, and weather-worn men. In this respect he is like George Eliot and Mrs. Stowe, like Whittier and Thoreau, that is to say, he is wholly possessed by a sense of the actual, of the real, and scarcely touched, or, if touched, but feebly touched, by the ideal as understood by certain writers and painters who rose at the beginning of this century.

EUGENE BENSON.

AT THE OPERA.

WITH ILLUSTRATIONS BY FRENZENY.

THE coaches up-rumbling to pause at those portals,
Which music holds revel within,
Disburden before them gay legions of mortals,
Ere yet the night's glories begin.
And thronged to their limit with many a patron,
The opera-corridors gleam,
Beau, critic, and patriarch, youth, maid, and matron,
In one multitudinous stream.

With lustre of silks and with glimmer of laces
At last the broad temple is filled;
The tardiest comers have taken their places,
The throng's busy murmur is stilled.
And now the fine *maestro*, where blandly serene he
Sits throned on his eminent chair,
Preludes the first notes of immortal Bellini,
By waving his *bâton* in air.

Why doubt if the soft eyes that tenderly glisten,
The smiles that from lovely lips glow,
Are kindled of spirits enraptured that listen
The music's divine ebb and flow?
Why doubt if delight that is born not completely
Of song's potent witchery, aways
The bosoms and cheeks whose rare tints rival sweetly
The blooms of the costly bouquets?

IN THE LOBBY

IN THE DRESS-CIRCLE.

THE LADY-KILLERS' BOX.

AT THE FINALE.

Why doubt it, ah, why? Yet no warbling Amina,
No love-lorn Elvino hath spells,
By silver *romanza*, by suave *cavatina*,
To charm these bright bebies of belles;
For all too devoutly their glances will follow
Where lounges or saunters or stares
This blond-haired Adonis, that dark-eyed Apollo,
Assuming magnificent airs.

How cold were the heart that could grant not the graces
Of Fashion's male idols and pets,
What time at the brilliant array of fair faces
They level their dainty *lorgnettes*!
With shirt-front immaculate, neck-tie artistic,
Superb gloves and exquisite hat,
Deserves not each gallant the gaze eulogistic,
Which greets him on this side and that?

Of course there are folk who condemn as too careless,
Vain, whimsical, flippant, their style,
Presuming to wish they would whisper and stare less,
But evil tongues love to revile.
By disapprobation such cavillers honor
Men made of superior clay,
And not prone to fancy a mere *prima donna*
Of greater importance than they.

But equally now unto all, it is certain
(The loud chorus singing their last),
Descends the huge breadth of that sombre green curtain,
Which proves the night's vanities past;
While some with grave brows hear the final strains dying,
Some hear them with boisterous claps,
And some, unconcernedly placid, are tying
And hooking and buttoning wraps.

Here rises a beauty, white-cloaked, in whose tresses
One diamond burns like a star;
There sounds the rich rustling of sumptuous dresses,
Here booms a sprung *chapeau de bras*;
And yonder, up-rumbling, to pause at the portals,
Dark coaches crowd vaguely in sight,
Receiving their cargoes of prosperous mortals,
And rolling them home through the night.

MARRIAGE.

MARRIED! No one cares for them now. Paul and Virginia are transformed into Darby and Joan. Benedick has forgotten his toothache, and Beatrice smiles at the story of Hero's death and resurrection—events which sealed her fate as well as her cousin's—with the melancholy conviction that somehow she was compelled to yield to a power far more potent than her own sweet will.

And here the hard and unpleasant truth may as well be stated—namely, that marriages occur in accordance with large general facts, over which individuals can exercise no authority, and that in numbers they are in no wise affected by the temper and wishes of the people. This first fact about marriage is not only prosaic, but humiliating. Shall not these people choose companions for life, and listen to the clerical "What God hath joined together let no man put asunder," at such time as they may mutually agree upon? By no means. The law says they shall do neither of these things; and the peculiarity of this law is that it cannot be violated. Furthermore, all who desire it will not be permitted to marry. What is to be said of such inimitable tyranny as this? Not marry when we choose, and whom we choose! Not to be consulted as to whether we shall marry or not! What is life worth if these things are to be decided without our knowledge or consent? Not much, perhaps; but we might just as well learn the disagreeable fact at once, and submit to it. Nature is fond of cheats, and plays her charlatany irrespective of persons—

"Men are the sport of circumstances, when
The circumstances seem the sport of men.

Youth has its illusions, and middle age its hallucinations, wherefore these teachings of statistics may go hang. Does not Romeo actually know that he chooses Juliet in preference to Rosalind? Is it at all probable that Miranda would have escaped marriage with Caliban, if she had never met the shipwrecked Ferdinand? Where and what is this tricky Puck that makes maidens see as he wills, and transforms Demetrius and Lysander, subject to no law save his own? Alas! this plodding and prosaic statist, this withered and bespectacled mathematician, will prove to you that Romeo is mistaken, that Miranda and Ferdinand are both controlled by the superior prevision of Prospero, and that Puck is, after all, nothing but the personified Price of Corn. These illusions and hallucinations are results of the operations of law, and we cannot disturb them, though we pile formula on formula, and equation upon equation, until the revolving earth is light as a feather, compared with the weight of the argument. *Per contra*, what cares passion for the multiplication-table, or love for the differential calculus? A fieu for you, law of statistics! Nevertheless, Maud commits an unintentional perjury when she vows her husband shall be the man of her choice, and we all know that Adolphus Fitzherbert will repeat Romeo's blunder.

Leaving the domain of fancy, we find the plain statistical facts concerning marriage running somewhat in this wise:

The average age of women, when they marry, is 25.46 years; and, of one hundred who reach this age, twenty-one will never marry. With men it fares differently; for, strange as it may seem, more women than men get married, and, of one hundred of the latter who reach the marriage age of 29.5 years, twenty-two will die bachelors. Thus, about one-fifth of our people are doomed to die unwedded, whether they prefer it or not.

Now, the marriages that occur in New York number, year by year, about nine thousand two hundred and eighty—eighteen thousand five hundred and sixty persons—and for every one of these marriages there will at some time be left a widow or widower, for it rarely happens that husband and wife die at the same moment. Some of these widows and widowers will remarry—more of the latter than the former, and because of this fact the actual number of women who marry will exceed the actual number of men. The rule seems to be that about one in three widowers, and one in four widows, remarry.

Of one hundred marriages, about thirteen of the men will be widowers, and only eleven of the women will be widows, the bachelors numbering eighty-seven, and the spinsters eighty-nine. On general principles, there may be no serious objection to old Weller's advice, "Beware of vidders;" but we, not basing our conclusion upon domestic experience, but upon a series of mathematical calculations, can absolutely affirm that widows do not, by any means, monopolize the matrimonial market, and that there is more to be feared from one spinster than from a dozen widows—let bachelors make a note of this fact—for the truth is, that spinsters have a better success against widows in the hunt for husbands than bachelors have against widowers in the winning of wives. And, as all the hunting and winning is above the will, and superior to it, we cannot say "beware" to any, but simply admonish all to accept the conditions, and to yield as gracefully as possible to their predestinate fate, whatever it may be—whether single blessedness or wedded woe, conjugal felicity or unwedded discontent.

Suppose there be a hundred weddings in New York within a given time, in all respects of the average kind, how many of these persons will be minors? From Paracelsus and Cagliostro down to Home and Fox, not one of all the soothsayers and clairvoyants can tell you that. No palm-reading gypsy, no spirit from the vasty deep, let him be called by no matter what boasting Glendower, can tell half so much of these occult events as this interrogating mathematician will learn from his curious figures and bewildering signs. Ask him, and he will reply, without any mummary or gibberish, twenty-four will have been married and about nineteen will be under age. Of this latter number all but one will be women—spinsters not yet out of their teens. At all events, this is the result of his present calculations, and if time and increased numbers should alter the averages he will learn the fact sooner than any one else. The remainder will be bachelors and spinsters of the average age of 29.5 for the former, and 25.46 for the latter.

What the law is that makes bachelors so much more prudent than spinsters we will not undertake to say; but certain it is that maidens make much more haste than young men in getting into the matrimo-

nial net. Still, it must be remembered that girls, whether prudently or not, are regarded as marriageable at fifteen, and are certainly so at seventeen; so that, in view of the fact that only eighteen in every hundred of the delicate creatures who marry are under twenty years of age, while forty-three of the same hundred are between twenty and twenty-five, and twenty-two more between twenty-five and thirty, we must candidly confess that they manifest a degree of prudence in the matter that would seriously disturb Mr. Malthus were he only aware of it. We will not say that marriage previous to the adult age is invariably indiscreet; but we will defy any one to form a just conclusion in regard to the age of discretion from the study of marriage statistics. To find this result, the marriage and mortuary tables must be studied together. The question is of some importance, but it must be unwillingly deferred.

But if women come upon the marriageable list earlier than men, they suffer the inconvenience of being stricken earlier from it. After forty-five, women are no longer regarded as eligible, matrimonially, and the demand for wives of this age is so slight as to be hardly worth considering, although we find an occasional widow—still more rarely a spinster—willing to marry even after having passed the sprightly age of threescore years and ten. Under twenty-five years of age the number of women who marry is a little more than twice as great as the number of men; but, after forty-five, the number of Benedicts is more than thrice that of the brides. In one thousand marriages of the average kind as to ages, fourteen women and forty-nine men will have passed their ninth lustrum. Widows remarry at an average age of thirty-nine years, while the average age of widowers who again take to themselves conjugal partners is forty-one or thereabout.

We will not undertake to tell each of our fair readers how old she will be when led to the altar a blushing bride, if that should prove to be her destiny; but we can tell her what the chances are in the present state of our knowledge of statistical facts. If we take the weddings that actually occur, we shall find that in every thousand there will be one hundred and seventy-nine wives under twenty years, while there will be only nine husbands of that tender age. But perhaps these facts will be better stated in statistical terms, thus: In every thousand marriages there will be—

Husbands.	Wives.	Ages.
9	179	Under 20 years of age.
292	434	Between 20 and 25 years of age.
348	226	“ 25 “ 30 “ “
172	81	“ 30 “ 35 “ “
83	43	“ 35 “ 40 “ “
44	20	“ 40 “ 45 “ “
25	8	“ 45 “ 50 “ “
12	3	“ 50 “ 55 “ “
6	1	“ 55 “ 60 “ “

The remainder, nine men and five women, will be scattered along between sixty and eighty years—an age at which almost any one would be expected to know better. It will be seen, however, that the desire as well as the opportunity for marriage falls off rapidly in both sexes after thirty—up to that age both seem to increase. In twenty-seven thousand five hundred marriages, or thereabout, there will be one hundred and nineteen men and only sixteen women between sixty and seventy years of age, while fourteen men and four women will be between seventy and eighty.

Interesting as these ancients are, there is still another class deserving of something more than a passing notice. We mean old maids. How many are there, and what are their matrimonial chances? We have already stated that twenty-one out of every hundred women who reach the marriage-age, namely 25.46 years, never marry. But even this does not tell the exact number of marriageable women who are waiting for husbands, if indeed so ungallant a thing as this may be said of any. But, then, how is it possible to expect an algebraic sign to be guilty of gallantry? From the best authority that can be had upon this exceedingly interesting topic, it appears that the number of unmarried and marriageable women, within those heretofore mentioned as the marriageable ages, namely, fifteen and forty-five, is about twenty-five per cent. of the whole number of women living between those ages.

Now, if the last census of New York be correct, the application of this rule will show us that the number of unmarried and marriageable women living on Manhattan Island at the time the enumera-

tion was made, was exactly fifty-one thousand two hundred and sixty-two. The race has somewhat increased since then; for the total population has been considerably augmented within five years, and during a part of the time the high prices of rents and food articles, the scarcity of labor, the darkened prospects and depressed business activity so loudly complained of among all classes of the community, made the number of marriages less than the average, and added largely to the list of unwedded maidens.

It seems to be a part of the creed of the discontented sisterhood, whether wives or spinsters, that one of the inalienable rights of woman entitles her to a husband. It will be seen that Nature sets her face against this assumption, and makes a very different decree. The truth is, that every woman living between the ages of fifteen and forty-five has twenty-five chances in one hundred of dying an old maid—that is, her chances of marriage are as four to one. This is just enough to give them all hope, and not sufficient to drive any to despair. The complaints of managing mammas are of no avail. Even the ballot will not bring them a better fate, and, with suffrage or without it, one-fourth of all between the above-named ages are doomed to live in old maidenhood and to die unhusbanded.

Our task is done. In dealing with these secrets we have doubtless been dull; but these hard facts will not admit of poetic treatment even if we were capable of treating facts poetically. When Benedick enumerated the virtues of the woman he would consent to husband, he said, “Her hair shall be of what color it please God.” He might have trusted the same good Providence—call it fate, destiny, or whatever you will—for all the other qualities just as well. An old adage says, “Marriages are made in heaven,” but Benedick’s was made in old Leonato’s garden, as we all know; and it is absolutely true in every case, as it was in the one we are considering, that those most interested have less to do with the result than they can well imagine, or, if they knew, would be willing to admit. For the individual that which he desires is good, that which he would shun is evil; but in the grand economy of the universe the two are so evenly balanced and so closely intertwined that he must be bold, indeed, who would undertake to say which is which.

Talleyrand, upon being introduced to two young men—one recently married, the other still a bachelor—called the former a happy man, and the latter a lucky dog. This is the broad philosophy of our deductions. Those who live unwedded need no sympathy; those who die married are worthy of no envy, for which of the two events is better no one can possibly determine.

NEW-YORK BOARDING-HOUSES.

IF you live in New-York City, and have a family to support, and have but a thousand or two a year, you will find it impossible to keep house. The rent of a house, by no means large or sumptuous, is two or three thousand dollars a year.

Boarding, then, is your only resource. Two-thirds of New York board, you are told, and three-thirds take boarders! You protest; but resign yourself to your fate, and enter upon the process, which, briefly summed, is very much like engaging as guide a person who has lost his own way. The woman who has rented the room to you rents it at your rate, as a rule, in despair of a better. She has rented all her rooms on the same principle, and is losing money. The two objects of her worried life are, to make her rent, and to keep her boarders just this side of mutiny. The process is a delicate one. Some one should simplify it by getting out tables of calculations based on past experience, with a *moralometer* of the different human temperaments attached, for many are the landlady’s perplexities! Mrs. Smith calls the butter names! With secret anguish the poor woman pays ten cents additional on the pound, and pinches it from the beef, which calls out Mr. Quimbo, whereupon she makes haste to reform on the beef article, and takes it out of the coal, which sets half a dozen ladies to conspire in whispers, while shivering in the chilly drawing-room.

The shifts, the direful straits of the landlady, weigh down the atmosphere of the house with moral gloom: for houses are as expressive as faces, and reflect quite as sensitively the soul within. The wretched system of housekeeping weights it, the atmosphere I mean, with something more substantial also, and the “good goddess of Pov-

erty" will not let her manage matters better. That unsympathizing deity allows her but one drudge, whose shoes and stockings are dreadful revelations, and who has the fires, the errands, the table, the sleeping-rooms, and the door-bell, all in charge. She is simply so much human instinct! Of course, no well-trained servant will accept such a post. Human instinct is not particularly reliable, rather a poor article apparently, and directs one to the worst thing possible! Irish instinct takes one turn more, and accomplishes results worse yet. The overworked landlady, and her ignorant and overworked assistant, who develops blunders as naturally as the caterpillar does the butterfly, are as insufficient for the house as the mistress's income is for the housekeeping. Somebody complains of the drawing-room, and it is hurriedly brushed out in the centre. The stairs are hinted at, and a broom is planted at the foot thereof, and leans against the balustrade for an hour or so the next morning. Mrs. Jenkins storms about the condition of her room. The maid appears, armed with broom and floor-cloth, sweeps all the dust into her closets, wipes the paint and the mirror with the floor-cloth, and departs triumphant.

For the last six years, perhaps, the house has been rented furnished to an ephemeral race of landladies, who each, after her turn at "how not to do it," gives way in despair to her successor. Under their régime, successive generations of Norahs and Bridgets have washed the paint in the dish-water, and wiped their hands on the curtains. Mould and dust are under the carpets, behind the wall-paper, in all the corners. The majority of houses are built as if the builders had a spite against human lungs, or were ignorant of their existence. Under favorable circumstances, good ventilation is difficult; but here the blinds are habitually closed, a little, to save the carpets, and principally to hide the dust. Light and air being thus excluded, in dark and dampness, the residuum of innumerable coffee-boilings, soup-makings, and washing-days, the savor of ham and eggs, fried fish, oysters, cakes, what not, combine with the subtle displeasing odors that are the sure consequence of negligent housekeeping, and collect and mass together till the house acquires an atmosphere of its own, familiarly known as "the boarding-house smell"—an atmosphere compounded chiefly of deadly enemies of human life. Meantime, three times a day, there is made a formidable attack on the stomach, in the shape of hard-burned fibre, minus the juices, called roast-meat, vegetables half raw, butter rancid, tea and coffee—familiar names for strange compounds of mineral substances, old leaves, and animal fat—poor bread, and worse pastry. And these horrors are aggravated by the dismal monotony, so that each day the victims are wretchedly sure what special badness to expect. The meals are eaten amid subdued growls and covert sneers, every one of which rankles like a poisoned dart in the landlady's worried breast; and a chorus of fault-finding rises afterward from each special chamber, whose echoes are sure to find her out wherever she may hide herself. Pause a moment, and give one sigh to this victim of poverty! It is cruel, pinching, merciless poverty that has made and keeps her what she is. To succeed in her department, she needs financial and executive ability. Ten to one, she has neither. She is there, simply because she cannot starve. The wolf is always at her door. She is never out of sight of the baleful glare of his eyes. She is taking in less money than it costs her to live, and eventually will fail. She knows it, but by every device in her power staves off the dreadful, inevitable moment. Each day is a terror. What is stigmatized as a meanness, is an agony; what is denounced in her as malice, is desperation. To live well, and suit the differing tastes of fifteen or twenty persons, in a city where every article is adulterated, and butchers, bakers, and grocers, build blocks of houses out of their profits, requires time, energy, intelligence, firmness, great inventive power, money, and genius; and every third woman left destitute, no matter how ignorant, nervous, and undisciplined, rushes into the business! What wonder that these martyrs are among the best-abused women of the day, and that, in course of time, they are apt to merit the worst that is said of them?

To come back to the system. The general disgust, dissatisfaction, and annoyance, make up what might be wanting in the attack on life and health. The nerves are continually rasped, the blood is poisoned, the digestion impaired, the body only half nourished, and its whole tone lowered. The men get reaction, perhaps, in the stir of business down-town; but their wives know no exercise and no change beyond an occasional languid walk. Unfortunately, the majority of these ladies would find a sense of degradation in such exercise as sweeping,

dusting, and bed-making, and sit with a certain sense of dignity in their dingy, disordered rooms till the arrival of the unkempt, ill-smelling drudge. And for the children, woe to them! Enervated, languid, and ailing, without the stimulus and the pleasant little ambitions of a home, the fretful mother takes refuge in novels and gossip, and, with a misery in her head and another in her back, finds the clamor, the questions, the perpetual activity of a boy or girl—both perhaps—unbearable in her crowded room; and the children, nothing loath, are sent to play in the street, while the mother, with a sense of exquisite relief, settles back luxuriously to her millinery, her novel, or her chat. Much has been said about the girls of the period, as if they appeared an abnormal, unaccountable blight on the healthy American tree; but has any one considered the children of the period? Is not this much-abused girl the natural development of the dear little Bedouins in crimped hair and bronze boots, the pretty Arabs in splendid sashes and embroidery, clustering about the steps or on the pavements? The question is a difficult one. The children must have air and exercise, and not many mothers are like the little lady whom I saw yesterday—a veritable lily of a woman, deliberately in open day helping her two young Knickerbockers to climb a lamp-post. Blessed little woman! How those boys will love her! Develop as they will, she is sure of a life-interest in their hearts. But such a tableau, or a daily airing in the parks, how impossible for ladies who have dignity, and a hundred important matters—dress-making, calls, engagements, and some pet complaint—on their hands! The children get their exercise as they can; and how is one to grow modest, home-loving girls, fresh as violets, in the glare of the streets, and within sight and hearing of the shows, sensations, and vices, of a great metropolis?

Hundreds of thousands endure this life, impatient and protesting, but seeing no remedy. In what are called first-class houses, it is true that some of the most glaring evils mentioned are subdued, or not found at all; but the same dissatisfaction prevails. The process, between the entrance into such a house, the first glow of enthusiasm, and the gradual development of the house's evil qualities to the point past bearing, is as well defined as in any other growth; and, when you hear that "the table is falling off," and that "mistress is a good woman, but lacks judgment," prepare yourself to take your friend's new number. The fact is, that boarding anywhere is like a steady chronic pain; occasional change of position is absolutely required to make it endurable, and it is in obedience to a natural law, and not because either landladies or boarders are hopelessly depraved, that we behold its victims revolving uneasily between east and west, the upper and lower sections of the town, like so many disappointed demons, seeking rest and finding none.

Urged by these evils, the Hardpan family, whom circumstances forbid to try that panacea, the country, have taken lodgings without board—it is only fair to their friends to say, in spite of all advice. They had been so long half starved or half poisoned that they were determined to take their dose of the ills of life in a new shape, and boldly entered on this novel phase of existence with a gas-fixture for cooking, and something of the sensation of a set of Robinson Crusoes who had just hired an island. It is a wonderful "gas-fixture," boils and broils almost as well as it could do in an advertisement. The steaks and chops are quite astounding—glorified steaks and chops, tender, juicy, not bearing the most distant relationship to the dried, tough pattern of the gridiron-bars served up in the boarding-houses. Their little drawing-room is quite remarkable. Undeniably, there is a bureau in it—not exactly a parlor-ornament—and two closet-doors, which people will open by mistake; but there is such a cosiness, a brightness, a freshness, about it! and, for my part, I believe that walls and room furnishings are not quite so unsympathetic as is commonly supposed, and that, where they are made much of, and confidentially used in the daily family life, they become thoroughly imbued with geniality and home feeling, and give it out in a way of which the finest drawing-room dedicated to Mrs. Grundy is quite incapable.

The Hardpans have discovered, also, that New York is a wonderful city. There are three bakeries, two fish-markets, four markets, all within four blocks, and half a dozen eating-houses within easy reach, and at any one they are quite ready to send you a dinner complete, or the soup or the roast alone, as you may choose. Every one is quite willing to send you any thing from anywhere, up as many flights of stairs as you may choose to live. Everybody understands the situation at a glance, somewhat to the astonishment of the Hard-

pass, who had a vague impression that they were the only family in lodgings. Two-thirds of their neighbors are living similarly. It is young Paris established in the heart of New York, and there is a general jollity observable throughout the street, widely differing from those sombre and elegant localities in which every one goes about with the full responsibility of a brown-stone house on his shoulders, or a brick house with brown stone facings—just as bad! To the Hardpan mind, life in lodgings puts on the cheeriest face; but then it is always to be borne in mind that to differently-constituted families it might wear a very different aspect, and become at once extravagant, dreary, and shambling.

Mrs. Hardpan is her own maid-of-all-work, has dismissed the doctor and a supposed liver-complaint, and grown rosy; but then Mrs. Hardpan has exercise exactly proportioned to her strength, and practically no stairs. The younger Hardpans are her feet, and serve as her ambassadors to those potentates—the butcher, the baker, and the grocer. The little system of housekeeping required by three or four rooms on one level, exercises, without overtiring, the muscles, and is an excellent substitute for the course of gymnastics insisted upon by her doctor. Then, the fresh cleanliness, the pure atmosphere of her well-kept rooms, the honest pleasure that is as much the fruit of moderate labor as the apple is of its seed, and the little triumphs and surprises in the line of omelets and ice-creams, produce healthier mental conditions than the constant rub against the boarding-house angles. But there are many ladies who would feel themselves fatally compromised if caught busy about the dinner, or who have souls above omelets! Let none of these attempt life in lodgings, nor those who pride themselves on a ponderous respectability, and who have no heart for a joke; for occasional Bohemianisms—dining entirely on fruit and creams, or *en masse* at a restaurant, piecing out the table-service with inappropriate saucers and waifs of bottles and pitchers—the thousand little devices and inventions required by this pocket housekeeping—are the flavoring, the *sauce piquante*, the sparkle, and save the life from falling flat and dead into monotony. Some are for a dinner of herbs, and some will have the “stalled ox” at all hazards. Every one to his taste! But for life in lodgings you must bring nerve enough to defy Mrs. Grundy, muscle enough to help yourself, if need be, and fun enough to confront a “predicament” with a laugh. Remember that; else, don't try it.

LOUISE E. FURNISS.

THE SCOTTS OF ABBOTSFORD.

To the Editor of Appletons' Journal.

SIR: In noticing the recent death of Lady Victoria Hope-Scott, sister of the Duke of Norfolk, niece of Lord Lyons, formerly British minister at Washington, and second wife of Mr. James Hope-Scott, the most eminent member of the Parliamentary bar, where he often makes his twenty thousand pounds per annum, several usually well-informed journals have incorrectly stated that Mr. Hope-Scott is the owner of Abbotsford, and that “it is melancholy to reflect that his” (Sir Walter Scott's) “family is entirely extinct, and the place fast going to decay.”

The Parliamentary counsel is not the owner of Abbotsford; Sir Walter Scott's family is not extinct; nor is his loved domain going to destruction. Abbotsford, when I visited it, was in the most perfect order, and a friend, who was there last summer, tells me that the grounds have been beautified and improved in various ways since his previous visit in the year 1855. The only change made since the death of Scott is the addition, to the north wing, of a Romish chapel, its present occupant being a member of that Church.

Mr. Hope-Scott married first Charlotte, granddaughter of Sir Walter, and daughter of the great novelist's favorite child, Sophia, wife of John Gibson Lockhart. Mary Monica Hope-Scott, a fair-haired, blue-eyed maiden of eighteen, is the sole survivor of the Scotts of Abbotsford, her mother having passed away to join two of her children who preceded her to the other world. Miss Scott, the great-grandchild of Sir Walter by the female side, is the heiress of Abbotsford house and estate; her father, who took the name of Scott on the death of his brother-in-law, Walter Scott-Lockhart, being merely the administrator, in respect to the property, at present. Should the young heiress marry, her husband must take the name of Scott; and

should she die without issue, then the property, but not the title, which is now extinct, will revert to the nephews of Sir Walter—sons of his brother Thomas, who reside in Canada. Thus, although there is no hope of founding a family in the direct male line, there may yet exist a long line of Scotts of Abbotsford.

Strange and sad is the fatality which has attended the family of the modern Shakespeare. Sir Walter's brothers all died young, and his sons and daughters were summoned early from this life. His gifted son-in-law and biographer, Lockhart, died broken-hearted in 1854; his daughter-in-law, the pretty heiress of Lochore, died childless. Let us hope that the surviving scion of the great minstrel's race may be long spared, to hand down to posterity the name and features of the distinguished Scotchman, whose presence was so dear to the generation who knew and revered him, and whose genius is one of the brightest inheritances of his native land.

JAMES GRANT WILSON.

TO MY OLD GRAY COAT.

MY old gray coat, my old gray coat,
Come wrap my aged form;
Surround me with thy ample folds,
To battle with the storm.

My old gray coat, my old gray coat,
Thou goest where'er I go;
By day or night, in heat or cold,
In hail, or rain, or snow.

The more the angry tempests rage,
The closer thy embrace;
Shielding my chilly limbs from harm,
Guarding my shrinking face.

Let others talk, as well they may,
Of friends of all degrees,
Thy friendship warms me every day,
While oft their friendships freeze.

Thou'st clung to me for many a year,
Though still I can't deny,
I've sometimes scorned thy kindly aid,
When summer friends were nigh.

But when November's nipping frost,
Forbodes stern winter weather,
We join again in fond embrace,
And closer cling together.

Let others richer garments prize,
Of brown, or black, or blue;
Still turn I with admiring eyes,
My old gray coat, to you.

I honor thee, my old gray coat,
For all thy blessings past;
And may the thoughts of by-gone days
Cement us to the last!

Thy youth is gone, thy fashion, too—
All outward charms decay;
But still thy virtues to my view
Grow brighter every day.

And if in rags, my old gray coat,
Still precious thou wouldst be;
I value thee for what thou'st done,
For what thou'st been to me.

DAVID PAUL BROWN.

TABLE-TALK.

HAS the reader heard of Ginx's Baby? "Who is Ginx," he undoubtedly exclaims, "and why should one hear of Ginx's Baby?" Ginx's Baby, let us explain, is a satire. "A what?" comes pretty emphatically and imperatively this time, but, in the words of Polonius, we beg him to "stay awhile; we will be faithful." "Ginx's Baby," which is now before us—not, of course, the individual baby in its infantile wrappings, but the satirical volume bearing this name—is a strange and veritable history of a destitute youngster, in whom the reader is requested to see personated and represented the baby-waifs of the United Kingdom of Great Britain. Let us follow the story a little, for it is instructive, and, we think, entertaining, too. Ginx's baby is the thirteenth child of Mr. and Mrs. Ginx, of St. Giles, London. Mr. Ginx had given Mrs. Ginx frank and fair notice that, as a dozen mouths were already more than he could feed, he should assuredly drown the thirteenth, if that lady should persist in her intent to populate a new ward in the metropolis. But Mrs. Ginx, in her obstinacy, did persist, and Mr. Ginx, in his obstinacy, determined to consign the new-comer to the Thames. On his way to execute this judicial sentence, followed by an excited crowd, he meets a police-officer, who lays down the law in the matter, and then is joined by two philosophers, who lay down the philosophy in the matter. "Man," says the law, "you're bound to support your child. You can't throw it off in that way—nor on the parish either." "Man," says philosophy, "you had no right to bring children into the world, unless you could feed, and clothe, and educate them." Whereupon a warm and lengthy discussion ensues, in which a shrewd stone-mason among the crowd joins and gets the best of the argument. "I'd just like to ask you," he says to the apostles of Malthus, "what a man's to do, and what a woman's to do, if they don't marry; and, if they do, how can you honestly hinder them from having children? Ain't it in nater," he asks, "for all beings to pair and have young? an' you say we ain't to do it! I think a statesman ought to make something out of what's nateral to human beings, and not try to change their natures." The discussion is interrupted by the appearance of a Sister of Mercy, who offers to take the care and nurture of the child, and into her hands it is surrendered. This is not the end but the beginning of the infantine Ginx's troubles. Mrs. Ginx is a zealous Protestant, and, when she learns the fate of the brat, is horrified that "her flesh and blood should be made Papish." The baby meanwhile, after no little controversy, is duly baptized according to the ceremonies of the Roman Church. The Protestant Detectoral Association, however, getting wind of the matter, and seeing in it a splendid opportunity for a first-rate sensation, take immediate measures to recover the baby. Accounts appear in the newspapers headed "No Popery, in which 'abduction of an infant;' mysterious and awful proceedings;" "assault on the liberty of the subject;" "outrage upon the nation by foreign mer-

cenaries"—are some of the choice phrases. A tremendous excitement is now created, and all Protestant England is in a hubbub. Applications are made to the Queen's Bench for the custody of the child. An exciting trial ensues, which ends in the surrender of the baby to the Protestant Association. Then come new and quite as exciting issues. How shall the child be supported? How shall it be educated? In whose charge shall it be retained? Every denomination in the Association has its particular views, and everybody asserts that the baby must be reared according to his theories. Meeting after meeting is held, and in each the debate is furious. Subscriptions come pouring in for the support of the baby, but they are all expended in pamphlets, placards, advertisements, and other expenses. While this exciting discussion is pending, the child is without a custodian. Everybody, frantic for principle, is unwilling to accept its temporary charge. At last a woman agrees to take charge of him, "for the sake of the cause;" but that night the unhappy brat is found on a door-step, stripped of its clothing, and abandoned. It is taken possession of by the police, and farmed out, pending the final determination of the Association as to its disposition. This final determination is never reached. The discussion extends over a year. By that time the interest in the brat has died out in the presence of new and more interesting foreign issues, and when at last a bill of thirty-six pounds for his keeping is presented, it is found that, of some thirteen hundred pounds raised in his behalf, there remain in the treasury but one pound four shillings and fourpence. The committee are asked to provide means for payment of the child's liabilities; they adjourn without doing so. The persons having him in charge now dun for their money, which, not getting, they soon abandon the youngster. One morning he is found wrapped up in a newspaper, and lying exactly across the boundary-line between two parishes. He is picked up and carried to the work-house of one parish; and then begins a new and fierce contest between the wardens of these two parishes as to which the care of the baby rightfully belongs. In the work-house where he is placed he is admitted under protest, and fed under protest. Prolonged litigation follows between the parishes, involving immense costs; and, when a decision is reached, the wardens discover that the youngster, who had been before unknown to them, is the famous Ginx's Baby. Then neither parish will have it. The baby is promptly returned to Mr. and Mrs. Ginx, who are legally bound to support him. Ginx declares that, no matter what the law says, he simply cannot do it. The baby, a night or two after, is found on the steps of the Radical Club. A benevolent member, Sir Charles Sterling, takes it into the club. Here he becomes a matter of prolonged and grave discussion. "He is only part of a great problem," says Sir Charles; "what are we to do with him?" Every one has his different idea. The statesmen of the club are as divided and polemical as the members of the Protestant Alliance. But our summary is getting too long. From the club Ginx's Baby gets into Parliament;

but Parliament debates, hesitates, thinks there is no real reason for baby's destitution, and escapes the matter by taking up the important "Timbuctoo question." Meanwhile the baby has grown into a youth, has run away from the club, and fallen into bad ways. His struggle for a living is prolonged and severe, and far from being always honest. At last, in despair, he one night jumps into the Thames. "Society which, in the sacred names of Law and Charity, forbade the father to throw his child over the Vauxhall Bridge at a time when he was alike unconscious of life and death, has at last driven him over the parapet into the greedy waters. . . . Philosophers," concludes this singular work, "philanthropists, politicians, Papists and Protestants, poor-law ministers and parish-officers—while you have been theorizing and discussing, debating, wrangling, legislating, and administering—Good God! gentlemen, between you all, where has Ginx's Baby gone to?" As a picture of the desperate social evils of modern society, and a scathing satire upon the methods for relieving them, "Ginx's Baby" is a graphic, sharp, pungent, and highly-entertaining volume, of which our summary gives necessarily but a scant idea.

— *The New-York Times*, in a recent article on "The Uses of Rich Men," remarks very truly that the notions of the communists are not likely to find favor or acceptance among the American people. A community in which labor is honored and loved, in which ambition is strong and the habit of accumulation general, will hardly ever take cordially to the theory, for instance, that a man ought to be sent to jail for taking rent for a house, or interest on a loan, or profits on money invested in a manufacture, or that anybody who wants capital and has not got it, and says he would like to have it, ought to have it supplied to him by his neighbor or the government for nothing. It thinks, however, that there is an impression among a large class of the community that very rich men—men, for instance, like Astor or Stewart, whose wealth is counted by tens of millions—are useless, if not injurious, to the body politic, and should in some way be suppressed or stripped of their overgrown accumulations. Against this crude notion the *Times* very sensibly argues that these rich men are, after all, only stewards of the nation, and that they are compelled, even if they did not desire to do so, to use their wealth for the public benefit. By their energy, prudence, and financial skill, they employ their money to the best advantage, and thus promote the common welfare and increase the common prosperity. The rich man, in this country, who remains rich or grows richer, does not waste his money in luxuries or in foolish and unproductive schemes. If he did, he would soon see the end of his wealth. On the contrary, "he invests it in all sorts of enterprises, to the selection of which he brings enormous natural shrewdness, strengthened by the experience of a lifetime, and in every one of which it is devoted wholly to the employment of labor. If he puts it in unproductive real estate even, as he doubtless does sometimes, he releases some one else's money, which goes into production.

If he builds houses to let, he employs labor, and helps to lower rents; if he makes railroads, he employs miners, iron-founders, machinists, and helps to transport commodities; if he goes into spinning and weaving, or gardening, the result is still the same—labor is employed, and employed with such sagacity that it is sure to return the capital and something more. If he loaded himself with diamonds, filled himself every day to the chin with French dishes, and wines, and wore cloth of gold, and lived in a palace, it would be found that his salary was low. If we dismissed him, that is, took his property from him, and employed a philanthropist, or editor, or lyceum-lecturer, to manage it in the interest of 'humanity,' the probabilities are that there would not be a cent of it left at the end of five years. It would have been put into the production of goods that nobody wanted, of roads on which nobody would travel, or stolen by knaves and wasted by visionaries." The true system, then, is to allow free scope to energy and enterprise, taking care only to preclude monopolies, so that every man has a fair chance, and to prohibit entails or any other contrivances by which estates accumulated by energy and skill are kept in idle and incompetent hands, instead of being subjected to the natural laws of diffusion.

— The members of the O. K. Club, a juvenile literary society in Baltimore, kindly send us word that for some months they have been subscribers to APPLETON'S JOURNAL, and desire to express their appreciation of its merits. They say: "We consider it the best family paper now published in this country. In quality of type and illustrations it has no superior. It gives more and better reading than any other paper or magazine of the same price." These are obviously very judicious views, and we cordially congratulate the young gentlemen of the O. K. Club on their good taste and sound judgment. They are certainly O. K. about the JOURNAL.

— We must again request our contributors, when writing to us, to give the titles of their manuscripts. Every day we receive letters running thus: "I send you by the mail that takes this a manuscript which I hope you will accept," etc. Each mail brings us many manuscripts, often without the author's name indorsed upon them, and it is only by an uncertain study of handwriting that we can tell to whom they belong. One of these correspondents writing from "Scrooba," wherever that may be, the name of the State not being given, informs us, as usual, that a manuscript has been sent, without naming it, and then forgets to sign his or her name to the letter!

— Those who wish fully to understand what art aided by artistic photography can do in giving a true as well as pleasing likeness, should see Sarony's large-sized crayons of Mrs. Scott-Siddons as Mary Stuart and Queen Elizabeth. It would be difficult to convey by description the individuality of these pictures, in which the artist has brought out the intensely pathetic expression of the lovely eyes and mouth of his fair sitter. In the Mary Stuart the eyes have a lightning-like gran-

deur. The "action" is splendid. Yet, with all the beauty of effect an ideal picture gives, the likeness is preserved.

Scientific Notes.

New Process for making Charcoal.

THE scarcity of charcoal, during the siege of Paris, led an engineer to the discovery of a new process for rapidly preparing this combustible. Having arranged a number of billets of wood in the form of a large fagot by means of wire, he placed the fagot vertically in a cast-iron tube, which served as the lid of a large cylindrical boiler, filled with lead in a state of fusion. The tube thus filled with the fagot of wood is gradually placed over the boiler containing the molten lead, by means of a small crane, and the fagot is slowly descended into the metallic bath. As wood in contact with lead makes the metal boil with great intensity, it is important to bear in mind that the descent of the fagot must be effected gradually, in order to prevent projections of the boiling metal. The wood, on account of its feeble density as compared with lead (viz., 0.9 to 12.50), floats upon the surface of the lead, and has to be pressed down by means of weights placed upon the cast-iron tube serving as lid, until the boiler is completely covered. The gases disengaged from the wood, thus imprisoned in the boiling lead, escape by a pipe passing from the lid to the furnace. These gases help to intensify the combustion, so that the expense of maintaining the lead at the proper temperature is insignificant. The carbonization of the fagot is exceedingly rapid. Billets eight inches in thickness, being thoroughly carbonized from the surface to the heart of the wood in less than twenty minutes. The lead does not penetrate into the pores of the wood, as might be supposed; the jets of gas emitted by the wood effectually preventing the infiltration of minute drops of lead. The expense of lead for the bath is trifling; the scum that gathers on the surface during these operations is occasionally removed, and easily restored to the state of pure lead by the ordinary means of fusion. The produce in charcoal, by this means, is thirty-two per cent.; while by the usual process of carbonization it is only from seventeen to eighteen per cent., even the charcoal distilled in close vessels yielding only twenty-eight per cent. It may also be interesting to know that the most of the products of distillation, which escape by the lead, may, in the process described, be utilized as vinegar, tar, and spirits of wood. In brief, this new method presents the merits of rapidity and economy, may be worked on a small scale, and produces charcoal good for all uses.

The tunnel of Mont Cenis was successfully terminated on December 25, 1870. At twenty-five minutes past four, the last layer of rock, in the axis of the mountain, was bored through, at the depth of seven thousand seven hundred and forty-three yards from Bardonnèche, and five thousand six hundred and thirty yards from Modane. The spectators who witnessed the fall of the last mass of rock, forming the wall of separation in the tunnel now bored through the entire length of thirteen thousand three hundred and seventy-three yards, hailed the event with enthusiastic cheers. The success of this admirable work is in the highest degree honorable to M. Sommeiller, the chief engineer. It is refreshing to turn aside from the horrors attending the war of extermination between France and Germany, to consider the

peaceful triumph of genius and the wonderful results of human skill and perseverance usefully employed, by which the barriers of Nature are broken down, to insure freedom of intercourse and communication between friendly nations brought into closer contact with each other.

Miscellany.

The House of Bourbon.

IF length of descent is a thing to be proud of, there ought to be no prouder family in Europe than that of the Bourbon. Not only can they trace a line unbroken to Hugh Capet, the strong-handed putter-down of a degenerate dynasty, but it leads through thirty generations of kings, interrupted here and there, where a stream breaks off, to run through banks studded with castles of honor only just short of royal. Hugh Capet is the first. From him the line runs uninterruptedly till we come to Louis IX., the Saint. The direct trunk here carries on the race of kings, which terminated in the children of Philip the Fair, and gave place to the House of Valois. After their failure of male issue, the Bourbons come in. Robert, sixth son of Louis the IX., married Beatrix, heiress of that noble fief of Bourbon which lay in the centre of France, north of Auvergne and Guienne. From him sprang eight Dukes of Bourbon; a stalwart, hard-fisted race, who were ever to the fore when fighting was going on, and always loyal to the crown, in good times and bad.

Antoine de Bourbon — a poor, irresolute creature, "the prince *sans gloire*," who never knew which side he was fighting for, nor which religion he belonged to — had the great good luck to marry Jeanne d'Albret, daughter to the King of Navarre and his wife, Margaret of Valois. By greater luck still, he had for an only son the jolliest, if not greatest, of French kings — their fourth Henry — whose succession put the Bourbon family, for the first time, on the throne of France. His claims were threefold. Through his father, he sprang direct from Louis IX.; through his mother, from Charles V.; and through his maternal great-grandfather, from Louis X. In the next generation but one, the race splits up again. The brother of Louis XIV., the Duke of Orleans, was the first of the Orleans branch, which now survives in the children and grandchildren of Louis Philippe. The representative of the direct line is the Count de Chambord, who is now fifty years of age, and has been long married, without children. He is supported by a very small following in France, who adhere to him from principle, and who will transfer their allegiance to the Orleans family as soon as he is out of the way. From time to time he puts his name to a document, which is drawn up and published to let people know he is still alive, and their king by divine right; and it may very reasonably be supposed that he has long since given up all hopes of succeeding to the crown. He seems to have inherited that character which is occasionally reproduced in the Bourbon family, of which the type is the indecisive and vacillating Antoine de Bourbon, father of Henry IV. Such was Louis XIII.; such Louis the Dauphin; such Louis XVI. Their energy and bravery are dashed by a fatal hesitation; they dare, but they think too long about daring; they resolve, but too late; they act, when the time for action is past.

One word on the Orleans family. They began, as has been said, with the brother of Louis XIV. He chiefly distinguished himself

by trying to spoil the grand old Castle of Blois. Three more dukes followed him, including that prince of debauchery, the regent. And then we come to Philippe Egalité, the father of Louis Philippe. This family, which has been in exile for twenty-two years, has shown how adversity may be borne without loss of dignity. They have been guilty of no conspiracies and no intrigues. Probably their conduct has never excited a single suspicion in the breast of the emperor. They have spent their time in travel, in study, in writing; and they have shown that, in intellect at least, there is one branch of the grand old house which is still ready to go to the front.

Concerning Lobsters.

Next to the egg, there is no shell-fish more edible than the lobster. It is an aquatic, and lives down at the bottom of the sea. He is the guardian-angel of October, and has his picture in the almanac over that month. Why he is the patron-saint of that portion of the year is a conundrum, the answer to which has not yet been handed in. Lobsters are built more for durability than speed, and are put together in short sections, or hinges, like a coat of mail. Their skin is hard, and resembles vulcanized rubber, and in color is a dark, dull, blue, blackish green. They are provided with much legs on either side, and have a pair of arms finished out with a decidedly big hand, which resembles a pair of mittens, it having only a thumb, all the balance being hand. When a lobster shakes hands with you, you always know when it takes hold, and are exceeding pleased when it gets done. They have small features, and lay no claim to good looks. When they locomote, they resemble a small boy shuffling off in his father's boots. They are backward, very. They even go ahead backward. They occasionally have a row, like other people, and in the *mêlée* sometimes lose a member, but have a happy faculty of growing out another. Their process is patented both in this country and Europe, which accounts for its not coming into more general use with the human lobster, so to speak. A lobster never comes on shore unless he is carried there by force. I never knew one to do so unless he got into hot water. They are afflicted with but one disorder, and that is boils. There is more real excitement in harpooning a whale, or having the measles, than there is in catching lobsters. The fisherman provides himself with a small hen-coop, and hangs therein, as enticers, several dead fish. He then rows his boat to the lobster-ground (which is water), and sinks his coop to the bottom, and anchors it to a small buoy (one from eight to ten years old will do), and then goes home. When he feels like it again, say in the course of a week or two, he goes back and pulls up his poultry-house, and, if he has had good success, he will find his game inside the coop. As an article of food, the real goodness of a lobster is in the pith. Very few persons relish the skin, and physicians say it is hard to digest. We, therefore, take the lobster and boil it till it is red-dy to eat. Nothing is better for colic than boiled lobster. It will bring on a case when cucumbers have failed. For a sudden case, we advise them crumbled in milk. Eaten at the right time and in proper quantities, lobsters stand second to no fruit we know of. They are great on eggs, and carry round vast quantities with them festooned all over their body. Merely to satisfy our curiosity we took the trouble to count the eggs toted around by a single lobster, and we found there were eight million seven hundred and sixty-four thousand three hundred and ninety-five by

actual count, and that lobster was not much on eggs either.

The Boy Franklin.

A stout, hardy-looking boy, with a great head, twelve or fourteen years old, clad in knee-breeches, with buckles in his shoes, is selling ballads in the streets of Boston—broad-sides printed on a single sheet, containing what were called "varses" in those times. One is "The Light-house Tragedy," giving an account of the shipwreck of Captain Worthilake and his two daughters, and the other "The Capture of Blackbeard the Pirate." He wrote the "varses" himself, and printed them also. "Wretched stuff," he says, "they were." No doubt of it. From eight to nine he has been in the grammar-school, but less than a year; then in another public school for reading and writing for less than another year—a short time, truly; but he made rapid progress, yet "failed entirely in arithmetic." In school he studied hard. Out-of-doors he was a wild boy—"a leader among the boys"—and sometimes "led them into scrapes." After the age of ten he never saw the inside of a school-house as a pupil. Harvard College was near at home and the Boston Latin School close by, its little bell tinkling to him in his father's shop; but poverty shut the door in his face. Yet he would learn. He might be born poor, he could not be kept ignorant. His birth to genius more than made up for want of academic breeding. He had educational helps at home. His father, a man of middle stature, well set, and very strong, was not only handy with tools, but "could draw prettily." He played on the violin and sang withal. Rather an austere Calvinist, a man of "sound understanding." Careless about food at table, he talked of what was "good, just, and prudent in the conduct of life," and not of the baked beans, the corned beef, or the rye-and-Indian bread. The father had a few books: Plutarch's "Lives," "Esays to do Good," by Cotton Mather, a famous minister at the "North End" of Boston, and, besides, volumes of theological controversy and of New-England divinity. Benjamin added some books of his own: Bunyan, Burton's Historical Collection; in all forty little volumes. He was fond of reading, and early took to writing poetry. Two children were born after him, making the family of the patriarchal number of seventeen. The father and mother were never sick. They died of old age, as we ought; he at eighty-nine, she at eighty-five. The apple mellowed or shrivelled up, and then fell off. It did not rot inwardly.

T. W. Robertson.

Thomas William Robertson, the distinguished dramatist, and author of "Society," "Ours," "Caste," and other comedies, died in London, on February 3d, at the age of forty-two. His plays are ten in number, and are among the best and least objectionable which the dramatic art of England has produced in this century. The London *Examiner* said of him, in a notice just before his death:

"Mr. Robertson has done more than any living writer to improve the condition of our drama. Cynical critics are fond of telling us that his plays are not of the highest order, and draw comparisons between him and such men as Sheridan and Goldsmith, greatly to his disparagement. We freely admit all the faults that can be found with Mr. Robertson's pieces, and the fact that he is not equal to our great comedy-writers of past times; but he has manfully waged war against the conventionality and vulgarity of our stage; he has given us dramas which, if they are slight in plot and

treatment, are at least works of art, carefully composed, and full of refined feeling and imagination. The theatre which is especially associated with these pieces has become in its way quite a school of acting, and actors and actresses from other theatres unconsciously drop stagey tricks and mannerisms when they appear on that stage. In addition to this, Mr. Robertson has tempted to the theatre many persons who seldom or never went, and has taught a large portion of the play-going public to look for and enjoy naturalness and refinement. Signs of this improvement in public taste have been clearly shown on many occasions during the last two or three years. Old conventional business, which was wont to set the house in a roar, has been met by an ominous silence or even hisses, and the indifferent reception which some of Mr. Robertson's pieces have met with was, in great measure, owing to the lessons he himself had taught."

The Duck and the Kangaroo.

Said the Duck to the Kangaroo,
"Good Gracious! how you hop,
Over the fields and the water, too,
As if you never would stop!
My life is a bore in this nasty pond,
And I long to go out in the world beyond,
I wish I could leap like you!"
Said the Duck to the Kangaroo.

"Please give me a ride on your back,"
Said the Duck to the Kangaroo;
"I would sit quite still, and say nothing but
'Quack!'"

The whole of the long day through!
And we'd go to the Dee and the Jelly Bo Lee,
Over the land and over the sea—
Please take me a ride, oh do!"
Said the Duck to the Kangaroo.

Said the Kangaroo to the Duck,
"This requires some little reflection;
Perhaps, on the whole, it might bring me luck,
And there seems but one objection,
Which is, if you'll let me speak so bold,
Your feet are unpleasantly wet and cold,
And would probably give me the roo-
Matiz!" said the Kangaroo.

Said the Duck: "As I sat on the rocks,
I have thought over that completely,
And I bought four pairs of worsted socks,
Which fit my web-feet neatly;
And to keep out the cold I've bought a cloak,
And every day a cigar I'll smoke,
All to follow my own dear true
Love of a Kangaroo!"

Said the Kangaroo: "I'm ready,
All in the moonlight pale,
But to balance me well, dear Duck, sit steady,
And quite at the end of my tail!"
So away they went with a hop and a bound,
And they hopped the whole world three times
round;
And who so happy, oh who!
As the Duck and the Kangaroo!"

The Old Trees of Cambridge.

Not many years ago, Cambridge might have been called the town of fine trees. It had elms venerable with age and tradition. It had noble chestnuts, whose branches cast deep shadows on the street, making cool breathing-places for man and horse. Now and then you might see a stately pine, and, where the moisture favored their growth, huge willows, standing side by side in brotherly embrace. It was pleasant to walk the rural streets in spring, and see the buds swell and the leaves come out. It soothed the fever in the blood in summer's hottest day to stand in the shelter of those leaves, when

they had clothed every branch with their tender green. Their autumn splendors dazzled the eye. And, when they withered and fell, a thousand fond recollections would steal over you, as the faded ones came trembling to the ground, with their story of death and decay. And thus, from year to year, these grand old trees stood by the wayside, as expectant friends stand upon the threshold and look for the coming feet. I never went to Cambridge without rejoicing in their welcome. I never turned my back upon the classic town without feeling that I bore with me their blessing and farewell.

For surely, thought I, those trees will always be there. Elsewhere they might be cut down to widen streets hourly thronged by drays and heavy-laden carts; the whirling spindle might drown the multitudinous voices of the winds among their leaves. But in a great seat of learning, where Homer and Virgil and Dante are studied, and Milton and Spenser and Shakespeare cherished, surely the axe will never be laid to the root of the tree until time has done its work upon the trunk and branches. Under one of these children of the forest, an Indian treaty was ratified. Under another, Whitefield preached, and Washington first drew his sword as commander-in-chief of the army of the Revolution. I have seen Longfellow and Lowell and Sparks standing together in its shade. There is not one of all these trees but what might tell pleasant stories, if, like the "spreading chestnut-tree," and the willows on the banks of the Charles, they could find an interpreter.

But alas for patriarchal trees even in classic Cambridge! An evil day has come upon them, and the power to preserve them, or to destroy, has been intrusted to unworthy hands. Each visit that I now make to the pleasant town reveals some new outrage of the spoiler. Tree after tree has fallen, and who can tell where his hand will be stayed!

The German Cæsar.

William I. is Emperor of Germany; Sovereign and Supreme Duke of Silesia and of the county of Glatz; Duke of Saxony, of Engern, and of Westphalia, at Gueldre, Magdeburg, Cleves, Juliers, Berg, Stettin, Pomerania, of the Calturnes and Wender, of Mecklenburg and Grossen; Prince of Rügen, Paderborn, Halberstadt, Münster, Minden, Cammin, Wenden, Schwerin, Ratzeburg, Moers, Eichsfeldt, and Erfurt; Lord of the countries of Rostock, of Stargardt, Lauenburg, Butow, Hargerloch, and Werstein; King of Prussia; Grand-duke of the Lower Rhine and Posen; Burgrave of Nuremberg; Landgrave of Thuringia; Margrave of the Upper and Lower Lusace; Prince of Orange, of Neufchâtel, and of Valengin; Count of Hohenzollern; Count-prince of Henneburg; Count of Ruppın and of the Marche of Ravensburg, Hohenstein, Fecklenburg, Schwerin, Lingen, Sigmaringen, Wehringen, and Pymont.

The crown-prince, on ascending the throne, will add to the above titles that of Honorary Doctor of the University of Bonn.

New-York Life Insurance Company.

A few failures, recently, of life-insurance companies have caused very naturally some anxiety in the public mind as to the soundness of others. In a business so extensive as life-insurance, and offering such inducements for adventurers, it is not at all surprising that a company is occasionally found to have been conducted on reckless or unbusiness-like principles. But this fact should not impair public

confidence in well-established companies, and of these there are many. The "New-York Life Insurance Company," for instance, is an old and prosperous institution, in the entire security of which there can be no well-grounded apprehensions. The last report of this company gives a clear and surprisingly-favorable exhibit of their present condition. By it we learn that the company have in cash assets the enormous sum of nearly sixteen million dollars, and have a surplus, to be divided among participating policies, of eleven hundred thousand dollars. Within six years, the assets of the company have increased \$12,137,437, notwithstanding that \$4,310,650 were paid out in claims, and \$4,734,759 in dividends to policy-holders. During the same period, the increase of the reserve fund, set aside for the security of policy-holders, has been \$11,674,269. The company closes its twenty-sixth year in a condition of prosperity of which it may well be proud. No one can examine its statements without being convinced that he may with the most perfect confidence trust to the fulfilment of its promises.

Price of Provisions in Paris on the Hundred and Third Day of the Siege.

Falkirk in Scotland.

Modern Falkirk is a pleasant town, and, like Ayr, is noted for honest (and hard-drinking) men, and bonnie lasses; but its chief claims to remembrance, in our day, are its annual "trystes," or cattle-markets, where more oxen and sheep are gathered together in one day than in any other town or city of the British empire, or perhaps of the world. A worthy Highlander, lately gone to his rest, who in his day was the greatest sheep-farmer and cattle-breeder in the North, was accustomed at the

Falkirk trystes, over his toddy in the evening, to hold forth to a sympathetic auditory in his favorite public-house, or "howff," on the great dignity of his calling. He asserted that to drive large flocks of sheep safely from the Highlands to the Lowlands was a work both of statesmanship and generalship, that entitled the performer thereof to a high place among the worthies of his country. "Talk of the Duke of Wellington," he said; "na doot he was a great mon, a vera great mon, and managed a few thousand troops wael enuch at Waterloo; but could he have driven a hundred thousand sheep from Sutherlandshire, and put them safely, without the loss of ane o' them, into the Falkirk tryste? No! my certies. That's a job that wad hae been over tough for him. He could na hae done it, sir; he could na."

The "Upper Ten Thousand" of England.

There are two hundred and thirty-one members of the Privy Council of England and Ireland, of whom thirty-one are entitled to sit on the judicial committee. The House of Peers consists of four princes of the blood-royal, two archbishops, twenty-seven dukes, thirty-two marquises, one hundred and sixty-four earls, thirty-five viscounts, twenty-four bishops, and one hundred and seventy-four barons, making a total of four hundred and sixty-two. There are one hundred and six peers of Scotland and Ireland who are not members of the Upper House, viz.: one marquis, thirty-one earls, twenty viscounts, and fifty-four barons. The House of Commons consists of six hundred and fifty-two members, there being at present four vacant seats. The nobility of the United Kingdom are five hundred and forty-eight in number, and there are fourteen peers who are minors, of whom one (the Earl of Pembroke) will come of age this year. There are thirteen peeresses in their own right, and twenty-three widows of peers whose titles have become extinct. The number of judges in England is twenty-six, and in Ireland twenty-three, and there are thirteen Scotch Lords of Session. There are two archbishops of the Church of England, and twenty-eight bishops, of whom two are suffragans. The Irish Episcopal Church consists of two archbishops and ten bishops, and the number of Indian, colonial, and missionary bishops is fifty-four. There are seven bishops of the Scotch Episcopal Church, and the number of retired bishops is nineteen. The Roman Catholic Church in England numbers twelve prelates, and there are four archbishops of that church in Ireland. There are twenty-two accredited foreign ministers in England, and the number of British ministers abroad is thirty-five. The number of governors of British possessions and colonies is sixty, and the lords-lieutenant of counties in Great Britain and Ireland are one hundred and seventeen. There are eight hundred and sixty-three baronets of the United Kingdom, and the number of noblemen and baronets who are knights is one hundred and twenty-eight. There are five hundred and nineteen knights, civil and military, exclusive of the honorary knights and the native knights of the Star of India. The Order of the Bath contains seven hundred and ninety-two companions, and there are one hundred and sixty-two companions of the Orders of the Star of India and St. Michael and St. George, which number includes the surviving Knights of Hanover. There are four field-marshal of the British Army, and the number of general-officers of all ranks (including those on half-pay and those whose rank is purely honorary) is six hundred and twenty-nine. The Indian Army contains two hundred

and ninety-four general-officers, and the number of flag-officers in the navy is three hundred and fifteen. The number of aides-de-camp to the queen is forty-four, and there are thirty-two medical officers who are honorary physicians and surgeons to her majesty. The judges of the county courts are sixty-one in number, and there are one hundred and ninety-seven queen's counsel and sergeants-at-law in England, the number in Ireland being one hundred and ten; the number of recorders of boroughs and cities in England and Wales is ninety-eight. There are thirty-three deans of cathedrals and collegiate churches in England and Wales, and the number of archdeacons in the same division of the kingdom is seventy. The chaplains and priests in ordinary to the queen number sixty-four. The number of royal academicians is forty-two, there being one vacancy to fill up, and there are three vacancies in the list of associates, who are twenty in number.

Mary's Lamb.

Mary had a little lamb,
And liked it very much;
It pleased her better far than birds,
Or ducks and geese, and such.

Whenever Mary came from school,
Her mother quick she sought,
And gave her not a moment's peace,
Until her lamb was brought.

And everywhere that Mary went
The lamb was sure to go,
Because when asked if she'd have more,
She never answered "No."

What made dear Mary like the lamb,
Does any one inquire?
Because she knew how good it was,
When roasted by the fire.

And when served up with good mint-sauce
And fresh green peas you'll know
How 'tis yourself, and understand
Why Mary liked it so.

Left-handedness.

At the last meeting of the British Association, Dr. Pye Smith read a paper on Left-handedness, and began by adducing some cases in disproof of the supposition which has been brought forward that left-handedness depends on transposition of the internal organs, or at least of the arteries of the upper limbs. These cases of transposition should be compared with those of similar inversion among flat-fishes and mollusks. On the other hand, left-handedness was held to be comparable to the deviations from complete bilateral symmetry seen among the higher crustacea. Probability pointed to a difference in development of the two halves of the brain; but the statements of Gratiolet to this effect have not been confirmed. Dr. Brown-Séquard's view that the left hemisphere presides predominantly over the animal functions, and the right hemisphere over those of nutrition, would, if confirmed, afford a good proximal explanation. The ultimate origin of the difference, whatever it be, in the brain must probably be that also of left-handedness itself, and was to be sought in some habit prevalent among early races, by which the right hand, eye, and foot, being used in preference to the left, conferred some advantage on the race. An interesting discussion followed. Dr. King stated that, in his visit to the north, he had found no left-handed people. But in Italy was found the curious fact of what was termed left-handed, or inverted, intellect. His opinion was that, through the position of the infant in the cradle, or some such cause, the great cerebral was thrown out of position, and

gave a certain impetus to the nervous system. If a larger proportion were placed at one side, the explanation of right-handedness would be obvious. Dr. Addison said that the majority of men at least, and he also supposed the same of women, were right-eyed, and that led to the use of the right hand. The explanation of this should be sought in the centre of the nervous system. In continuation of these remarks, another speaker said that, having to use his left hand, he found no difficulty in acquiring full dexterity. It was also quite possible to write equally well with the left hand, and, in fact, to become ambidexterous, so that the explanation of left-handedness must be sought in education and descent. Dr. Rolleston, who presided over the meeting, in winding up the discussion, alluded to the fact that the left side of the brain got a more full and distinct supply of blood than the right side. But the force of this fact was also weakened by the counter-avertment, supported in some measure by proof, that this peculiarity was hereditary, and the result of some original and accidental deviation.

Baal-worship.

The festival of Baal, or Balder, was celebrated on midsummer night in Scania, and far up into Norway, almost to the Lofoden Islands, until within the last fifty years. A wood-fire was made upon a hill or mountain, and the people of the neighborhood gathered together, in order, like Baal's prophets of old, to dance round it, shouting and singing. This midsummer-night fire has even retained, in some parts, the ancient name of "Baldersbal," or Baldersfire. Leopold von Buch long ago suggested that this custom could not have originated in a country where at midsummer the sun is never lost sight of, and where, consequently, the smoke only, not the fire, is visible. A similar custom also prevailed, until lately, in some parts of our islands. Baal has given the name to many Scandinavian localities, as, for instance, the Baltic, the Grent and Little Belt, Belte Turga, Baleshaugen, Balestranden.—*Sir John Lubbock's "Prehistoric Times."*

The *Moniteur Universel*, the official organ of the government at Bordeaux, has published a kind of history of the French navy during the war. Never was there such a record of imbecility. It was proposed to send two fleets to the Baltic, one consisting of fourteen iron-clads, and another of gunboats, batteries, and steam-transports, with thirty thousand troops on board. Cherbourg, however, had been stripped, to foster Brest and Toulon, till there were neither fire-arms, victuals, nor sailors, and the fleet at last consisted of only seven iron-clads and one corvette. Especially was it without the American ram the *Rochambeau*, the only vessel in the admiral's opinion capable of encountering the King William, but so disliked by the French builders as an American vessel that they had hidden her up under pretence of repairs. The admiral's object was to seek out Prince Adalbert's fleet, but his ships were insufficiently provided with coal, and he was compelled to make for a port in Denmark. In the Baltic, however, he found that he had no maps, and received new orders to watch both Jaldé and Kiel, places nine hundred miles apart, with dangerous straits between them. The negotiations with Denmark failed, as is well known, and the admiral determined to watch Jaldé, but found before he quitted the Baltic that his heavy vessels were totally unsuited to the narrow channels and shallow coasts of that sea. The fleet was subsequently ordered again to the Baltic, but returned to the North Sea, and ultimately to

France, having accomplished literally nothing beyond driving the Prussian fleet into harbor.

John Peter Grant, Writer to the Signet, the only surviving son of the celebrated Mrs. Grant, of Laggan, died in Edinburgh last month, at the age of seventy-two, having been born in the Manse of Laggan, June 1, 1799. The deceased gentleman was the author of a memoir of his mother, published in 1844, and was also the editor of a fine edition of Mrs. Grant's "Letters from the Mountains." Some of our young readers may not know that, when about eight years of age, Mrs. Grant accompanied her father, who was an officer in the British Army, to America, and became acquainted with Madame Schuyler, of Albany, the widow of Colonel Philip Schuyler, and aunt to the distinguished general of that name, and that the little Scotch lassie enjoyed the advantages of her society for four years. The gratitude of the child was vividly recorded in a portrait of Mrs. Schuyler, containing many charming pictures of Colonial life, and entitled "Memoirs of an American Lady."

Varieties.

FOR a long time the Patagonians, it was understood, were real giants. Then this was denied; observers, it was asserted, had looked at them through the magnifying medium of a fog. But a letter from a member of the Magellan Colony speaks of some of them as standing six feet, six or seven inches, and "from head to heel symmetry itself." Nor is it unusual to find a Patagonian weighing as much as two hundred and eighty-five pounds. With all their splendid physical characteristics, the race is degenerating "through the use of tobacco and liquor." Moreover, with all their bodily strength, the people are said to be exceedingly cowardly. Most of their wounds are given from behind. Heretofore they have recovered marvellously soon from wounds; but with their degeneration the process is slower.

There is rather a long array of ex-rulers now living in Europe. Their names, including some who had never more than nominal tenure of their thrones, are as follows. The time when they "went out of business" is also given: Prince Gustavus Vasa of Sweden (1809); Count de Chambord (August 12, 1830); Duke Charles of Brunswick (September 16, 1830); Count de Paris (February 24, 1848); Duke Robert of Parma (1859); Grand-duke Ferdinand of Tuscany (1860); Duke Francis of Modena (1860); Francis II. of Naples (February 13, 1861); the widow of King Otto of Greece (October 24, 1862); Duke Adolphus of Nassau (1866); King George of Hanover (1866); The Elector of Hesse (1866); Princess Carlotta, ex-Empress of Mexico (1867); Isabella, Queen of Spain (1869); Napoleon III. (1870).

The late celebrated Dr. Warren of Boston gave his skeleton to the medical school by will. Jeremy Bentham, also, by will, gave his bones to a friend, who made much of them, and kept them, decently dressed, in his library. And here is Dr. Isaac Rowell, late of San Francisco, who in his last testament desired that his body might be dissected by his medical friends, the softer parts burned and the ashes preserved in an urn. Then Dr. Rowell further desired that his skeleton might be wired well together and kept in some medical college or university in San Francisco. Provided, nevertheless, that if the widow wished for the bones of her late-loved, they were to be delivered to her upon her paying the expenses of preparation.

John H. Surratt, in his lecture at Baltimore, related a singular incident which occurred to him while he was serving in the papal army: "He said that, as he and a party of his comrades were sitting together, it was proposed that each should tell how he came to be there. When his turn came, he evaded the truth by saying that a love of adventure had brought him. But a Frenchman said: 'I know what

brought you here; you are Booth; you killed President Lincoln, and you came here to hide.' The Frenchman knew nothing about Surratt or his history, and his remark was the prompting of a mysterious impulse that he could not explain."

A clergyman, in Oswego, recently complained to the *Times* of that city, not without reason, of the ridiculous work which its composers had made in putting in type one of his sermons. He used abbreviations in his manuscript, as, for instance, a simple straight mark for "the." This the composers made a numeral (1). He used "G" for God, and this the composers invariably made (9) "nine." That sermon ought to be preserved as one of the curiosities of typography.

M. de Catacazy, the Russian minister at Washington, devised a very pretty method of celebrating his wife's birthday. At eight o'clock she was awakened by music in her dressing-room, and, afterward, her husband's monogram, wrought in flowers, was sent her on a silver waiter. In every flower forming the monogram was placed a gold dollar. At the dinner, that day, concealed music again lent its charms to the happy anniversary.

A correspondent writing from Versailles says: "If I were asked why the Prussians had beaten the French in this great war, I should answer that I thought they had done so because they had better heads, arms, and legs, than the French. If I were asked whether I thought the Prussians could lose that superiority, I should say that they might, if they remained too long in France."

That was not a trifling exaction, made of a gentleman who was rather closely pressed in a social company to sing a song. He had a voice like the tearing of a strong rag, and *knew* it. "I see what you are after," he said, "you want to make a *butt* of me!" "Not a bit of it," responded one of his tormentors, "we only want to get a *stacc* out of you!"

Italy publishes 723 newspapers. In Florence alone, 101 periodical publications find sale—there being a daily average of 35,000 copies. In the province of Milan, 93 appear either daily, weekly, or monthly; in Turin, 73; in Naples, 47; in Genoa, 37. The Florence *Opinione* circulates a daily edition of 10,000. The *Italie* (French) has 6,000 subscribers.

Mr. John Ruskin has published a new work on political economy, an extract from which informs us that Mr. Ruskin wants to destroy "most of the railroads in England and all the railroads in Wales;" and that he also thinks it would be well to "destroy, without rebuilding, the new town of Edinburgh, the north suburb of Geneva, and the city of New York."

ACCOMMODATING NEWSBOY: "Evening paper! Evening paper! Tenth edition! Another great German victory!"

MONSIEUR CHOSE: "Go away vid your paper; I am Frenchman."

ACCOMMODATING NEWSBOY: "All right, yer honor, here's another where the Germans ha' got a hawful lickin'."

An Arkansas planter, who has carefully noted the work of about sixty Chinamen, reports that they are better cotton-pickers than the negroes, and that they are very industrious and obedient, and, at the same time, cleanly in their habits and persons. They work for fifteen dollars a month and board, and live principally on rice and molasses.

The Atlanta *Sun* asks: "Why are we not to-day the richest people in the world?" The Louisville *Journal* presumes it is chiefly because there are other people in the world who have the advantage of us in point of property.

The inquiry as to where all the pins go to, has been satisfactorily answered. The theory now is, that they go into the ground and become terrapins, by the Darwinian process of development.

The height of pugilistic sarcasm was reached the other day by Jem Mace, who, speaking of a rival accused of beating his wife, said: "What! him? He couldn't lick a postage-stamp."

Charles Lamb told Barry Cornwall, when they were once making up a dinner-party to-

gether, not to invite a certain lugubrious friend of theirs. "Because," said Charles, "he would cast a damper even over a funeral."

A farmer of Scipio, New York, has a turkey that has laid one hundred eggs in a hundred days, never missing a day on account of sickness, or a circus in town, or any thing.

A medical journal estimates that the people of the United States pay one hundred and twenty-five million dollars yearly for physicians' services and for medicines.

A minister asked a tipsy fellow leaning up against a fence, where he expected to go when he died. "If I can't get along any better than I do now," he said, "I shan't go anywhere."

Otto Janke, the Berlin publisher, has made a novel present to the hospitals there—eighteen thousand volumes of the Muhlbach stories, of which he is the publisher.

Field-marshal Von Wrangel, the oldest soldier in the Prussian army, celebrated his diamond wedding (sixtieth anniversary) on Christmas-day.

Two daughters of Baron Anthony Rothschild are the authors of a work just published in London, called "The History and Literature of the Israelites," in two volumes.

Ex-Queen Isabella of Spain is now reported to have attained a weight of two hundred and thirty-eight pounds, with a growing tendency to enormous corpulence.

It is not strange that Dio Lewis should be deeply impressed with the importance of health when his name is a perpetual invocation to his own funeral.

"O woman, in our hours of ease!
Uncertain, coy, and hard to please;
But seen too oft, familiar with her face,
We first endure, then pity, then embrace."

When a man's business is rapidly running down, it is time for him to think of winding it up.

The United States last year produced ninety million gallons of molasses—ten millions less than the year before.

It is stated that more than two hundred students of the German universities have been killed during the war.

The passengers in a snow-bound train, in Wisconsin, had to tunnel through the snow, in order to reach the nearest village.

Don Piatt calls some of the Senators "featherless owls." "Tu whoo does this screecher apply the epithet?" asks the Chicago *Post*.

Is it proof of an economical disposition, if a young lady indulges in tight lacing to prevent waist-fulsness?

The English custom of celebrating the birthday of one's eldest son by a ball or a party has become quite general in New York.

A Paris correspondent writes that, since the siege, "the surviving cats of Paris are extremely shy, and no longer court on the roofs."

A kiss, says a French authoress, costs less and gives more pleasure than any thing else in the world.

Sioux City has more marriages than any city of its size at the West, but they seldom last more than a month.

In 1830 the United States had forty-one miles of railroad. In 1871 there are fifty thousand miles.

Paradoxical as it may seem, people who are inclined to be fat are generally the least inclined to be so.

The Sultan of Turkey's private life is declared to be a combination of that of Claudius and Commodus.

The way to become round is to eat square meals.

When is the letter D most useful? When it turns rain into the drain.

What is that which no one wishes to have and no one wishes to lose? A bald head.

Mythological festivity—Hercules going to dine with a club.

In Germany, ten dollars is a high price for a popular lecture.

Railways are aristocratic. They teach every man to know his own station, and to stop there.

Constantinople has sixty-eight thousand four hundred volumes in its public library.

Nearly every South-American seaport has a horse-railroad.

There is said to be a horse at Mount Vernon, Illinois, that is nearly fifty years old.

It is estimated that nine inches of dry snow on the ground is equal to one inch of water.

Vinnie Ream's statue of Lincoln is certainly a "Ream-arkable work of art."

"Two heads are better than one," as the gentleman remarked to the celery.

When a person declares that his brain is on fire, is it etiquette to blow it out?

The Museum.

CONTINUING our series of geological illustrations, we reach what is known as the Quaternary epoch, which brings the revolutions of the globe down to our own time. The tranquillity of the earth was disturbed during this period but little. There were a few cataclysms of limited sphere, an interval of cold which extended over a long period, and the deluges and glacial period. Lyell and some other geologists designate this era as the *Post-Tertiary epoch*.

Our illustration is an attempt to represent the appearance of Europe during this period, with groups of the antediluvian animals. The huge *Ursus spelæi*, or cave-bear, which was probably a fifth larger than the brown bear of our own day, is seated at the mouth of its den, where it appears to be gnawing the bones of an elephant. The cave-bear was more squat than its modern successor. Some of the skeletons which have been discovered are from nine to ten feet long and about six feet high. It abounded in England, France, Belgium, and Germany. Above the cavern, the *Hyæna spelæi* is seen. This creature resembled the spotted hyæna of our own times, and seems to have been only a little larger. The great wood-stag, the mastodon, the bison, and the rhinoceros of the period, may be seen occupying the farthest shore of a small lake. Mountains, recently upheaved, rise on the distant horizon of the landscape, covered with a mantle of snow, and reminding us that the glacial period is approaching.

The most abundant fossil remains of this period are those of the elephant and the horse. The extent which the fossil bones of the elephant are scattered over the world is very remarkable. They are found in the north of Europe, in Scandinavia, in Ireland, in England, in Central Europe, in Greece, in Italy, in Africa, in Asia, and in the frozen regions of Siberia. Off the coast of Norfolk, England, two thousand elephants' teeth were fished up between the years 1820 and 1823. The number found in Siberia, a region altogether uninhabitable for the elephant in our days, is immense. New Siberia and the Lâchow Islands off the mouth of the river Lena are, for the most part, only an agglomeration of sand, ice, and elephants' teeth. At every tempest the sea casts ashore new quantities of mammoths' tusks, and the inhabitants of Siberia carry on a profitable commerce in this fossil ivory. Every year, during the summer, innumerable fishermen's barks direct their course toward this *isle of bones*; and, during winter, immense caravans take the

same route, all the convoys drawn by dogs, returning charged with the tusks of the mammoth, each weighing from one hundred and fifty to two hundred pounds. The *Isle of Bones* has served as a quarry of this valuable mate-

rial, for export to China, for five hundred years; and it has been exported to Europe for upward of a hundred. But the supply from these strange mines apparently remains practically undiminished. What a number of

accumulated generations of these bones and tusks does not this profusion imply!

Our next geological illustration will afford an ideal view of an American landscape in the Quaternary epoch.

Illustrations of Geology.—Ideal Landscape of the Quaternary Epoch.

A NEW AMERICAN NOVEL!

Will be commenced in number 103 (March 18th) of

APPLETONS' JOURNAL,

A New Novel of American Life,

ENTITLED

"MORTON HOUSE."

By CHRISTIAN REID,

AUTHOR OF "VALERIE AYLMEYER."

"Valerie Aylmer" was pronounced, on its appearance last summer, "one of the best of American novels." "The descriptive power—the word-painting power of the author," said a distinguished critic, "is very great." "Morton House" is a story of Southern life, of thirty years ago, and will be found to possess remarkable interest and power.

It will appear serially in each number of APPLETONS' JOURNAL, until completed.

D. APPLETON & CO., Publishers, New York.

NOW READY,

APPLETONS' JOURNAL—VOLUME IV.

July 2d to December 31st, 1870.

Bound in Muslin, gilt back and side.....Price, \$3.50.

BINDING CASES

FOR

APPLETONS' JOURNAL—VOLUME IV.,

Now Ready.

Mailed, post-paid, to any address within the U. S., on receipt of 75 cents.

RALPH THE HEIR.

By ANTHONY TROLLOPE.

[“RALPH THE HEIR,” SUPPLEMENT NO. XVII.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF FEBRUARY 18.]

CHAPTER XLV.

“NEVER GIVE A THING UP.”

MR. NEEFIT'S conduct during this period of disappointment was not exactly what it should have been, either in the bosom of his family, or among his dependants in Conduit Street. Herr Bawwah, over a pot of beer in the public-house opposite, suggested to Mr. Waddle that “the governor might be—,” in a manner that affected Mr. Waddle greatly. It was an eloquent and energetic expression of opinion—almost an expression of a settled purpose, as coming from the German as it did come; and Waddle was bound to admit that cause had been given. “Fritz,” said Waddle, pathetically, “don't think about it. You can't better the wages.” Herr Bawwah looked up from his pot of beer and muttered a German oath. He had been told that he was beastly, skulking, pig-headed, obstinate, drunken, with some other, perhaps stronger epithets, which may be omitted—and he had been told that he was a German. In that had lain the venom. There was the word that rankled. He had another pot of beer, and though it was then only twelve o'clock on a Monday morning, Herr Bawwah swore that he was going to make a day of it, and that old Neefit might cut out the stuff for himself, if he pleased. As they were now at the end of March, which is not a busy time of the year in Mr. Neefit's trade, the great artist's defalcation was of less immediate importance; but, as Waddle knew, the German was given both to beer and obstinacy when aroused to wrath; and what would become of the firm, should the obstinacy continue?

“Where's that pig-headed German brute?” asked Mr. Neefit, when Mr. Waddle returned to the establishment. Mr. Waddle made no reply; and when Neefit repeated the question with a free use of the epithets previously omitted by us, Waddle still was dumb, leaning over his ledger as though in that there were matters so great as to absorb his powers of hearing. “The two of you may go and be — together!” said Mr. Neefit. If any order requiring immediate obedience were contained in this, Mr. Waddle disobeyed that order. He still bent himself over the ledger, and was dumb. Waddle had been trusted with his master's private view in the matter of the Newton marriage, and felt that on this account he owed a debt of forbearance to the unhappy father.

The breeches-maker was, in truth, very unhappy. He had accused his German assistant of obstinacy, but the German could hardly have been more obstinate than his master. Mr. Neefit had set his heart upon making his daughter Mrs. Newton, and had persisted in declaring that the marriage should be made to take place. The young man had once given him a promise, and should be compelled to keep the promise so given. And in these days Mr. Neefit seemed to have lost that discretion for which his friends had once given him credit. On the occasion of his visit to the Moonbeam early in the hunting-season, he had spoken out very freely among the sportsmen there assembled; and from that time all reticence respecting his daughter seemed to have been abandoned. He had paid the debts of this young man, who was now lord of wide domains, when the young man hadn't “a red copper in his pocket”—so did Mr. Neefit explain the matter to his friends—and he didn't intend that the young man should be off his bargain. “No; he wasn't going to put up with that; not if he knew it.” All this he declared freely to his general acquaintance. He was very eloquent on the subject in a personal interview which he had with Mr. Moggs senior, in consequence of a visit made to Hendon by Mr. Moggs junior, during which he feared that Polly had shown some tendency toward yielding to the young politician. Mr. Moggs senior might take this for granted; that, if Moggs junior made himself master of Polly, it would be of Polly pure and simple, of Polly without a shilling of dowry. “He'll have to take her in her smock.” That was the phrase in which Mr. Neefit was pleased to express his resolution. To all of which Mr. Moggs senior answered never a word. It was on returning from Mr. Moggs's establishment in Bond Street, to his own in Conduit Street, that Mr. Neefit made himself so very unpleasant to the unfortunate German. When Ontario put on his best clothes, and took himself out to Hendon on the previous Sunday, he did not probably calculate that, as one consequence of that visit, the Herr Bawwah would pass a whole week of intoxication in the little back parlor of the public-house near St. George's Church.

It may be imagined how very unpleasant all this must have been to Miss Neefit herself. Poor Polly, indeed, suffered many things; but she bore them with an admirable and a persistent courage. Indeed, she possessed a courage which greatly mitigated her

sufferings. Let her father be as indiscreet as he might, he could not greatly lower her, as long as she herself was prudent. It was thus that Polly argued with herself. She knew her own value, and was not afraid that she should ever lack a lover when she wanted to find a husband. Of course, it was not a nice thing to be thrown at a man's head, as her father was constantly throwing her at the head of young Newton; but such a man as she would give herself to at last would understand all that. Ontario Moggs, could she ever bring herself to accept Ontario, would not be less devoted to her because of her father's ill-arranged ambition. Polly could be obstinate, too, but with her obstinacy there was combined a fund of feminine strength which, as we think, quite justified the devotion of Ontario Moggs.

Amid all these troubles Mrs. Neefit also had a bad time of it; so bad a time that she was extremely anxious that Ontario should at once carry off the prize—Ontario, or the gas-fitter, or almost anybody. Neefit was taking to drink in the midst of all this confusion, and was making himself uncommonly unpleasant in the bosom of his family. On the Sunday—the Sunday before the Monday on which the Herr decided that his wisest course of action would be to abstain from work and make a beast of himself, in order that he might spite his master—Mr. Neefit had dined at one o'clock, and had insisted on his gin-and-water and pipe immediately after his dinner. Now Mr. Neefit, when he took too much, did not fall into the extreme sins which disgraced his foreman. He simply became very cross till he fell asleep, very heavy while sleeping, and more cross than ever when again awake. While he was asleep on this Sunday afternoon Ontario Moggs came down to Hendon dressed in his Sunday best. Mrs. Neefit whispered a word to him before he was left alone with Polly.

“You be round with her, and run your chance about the money.”

“Mrs. Neefit,” said Ontario, laying his hand upon his heart, “all the bullion in the Bank of England don't make a feather's weight in the balance.”

“You never was mercenary, Mr. Ontario,” said the lady.

“My sweetheart is to me more than a coined hemisphere,” said Ontario. The expression may have been absurd, but the feeling was there.

Polly was not at all coy of her presence—was not so, though she had been specially

ordered by her father not to have any thing to say to that long-legged, ugly fool. "Handsome is as handsome does," Polly had answered. Whereupon Mr. Neeft had shown his teeth and growled; but Polly, though she loved her father, and after a fashion respected him, was not afraid of him; and now, when her mother left her alone with Ontario, she was free enough of her conversation.

"Oh, Polly," he said, after a while, "you know why I'm here."

"Yes; I know," said Polly.

"I don't think you do care for that young gentleman."

"I'm not going to break my heart about him, Mr. Moggs."

"I'd try to be the death of him, if you did."

"That would be a right down tragedy, because then you'd be hung—and so there'd be an end of us all. I don't think I'd do that, Mr. Moggs."

"Polly, I sometimes feel as though I didn't know what to do."

"Tell me the whole story of how you went on down at Percycross. I was so anxious you should get in."

"Were you now?"

"Right down sick at heart about it—that I was. Don't you think we should all be proud to know a member of Parliament?"

"Oh; if that's all—"

"I shouldn't think any thing of Mr. Newton for being in Parliament. Whether he was in Parliament or out would be all the same. Of course he's a friend, and we like him very well; but his being in Parliament would be nothing. But if you were there—!"

"I don't know what's the difference," said Moggs, despondently.

"Because you're one of us."

"Yes; I am," said Moggs, rising to his legs and preparing himself for an oration on the rights of labor. "I thank my God that I am no aristocrat." Then there came upon him a feeling that this was not a time convenient for political fervor. "But, I'll tell you something, Polly," he said, interrupting himself.

"Well—tell me something, Mr. Moggs."

"I'd sooner have a kiss from you than be prime minister."

"Kisses mean so much, Mr. Moggs," said Polly.

"I mean them to mean much," said Ontario Moggs. Whereupon Polly, declining further converse on that delicate subject, and certainly not intending to grant the request made on the occasion, changed the subject.

"But you will get in still—won't you, Mr. Moggs? They tell me that those other gentlemen ain't to be members any longer, because what they did was unfair. Oughtn't that to make you member?"

"I think it ought, if the law was right—but it doesn't."

"Doesn't it now? But you'll try again—won't you? Never give a thing up, Mr. Moggs, if you want it really." As the words left her lips she understood their meaning—the meaning in which he must necessarily

take them—and she blushed up to her forehead. Then she laughed as she strove to recall the encouragement she had given him. "You know what I mean, Mr. Moggs. I don't mean any silly nonsense about being in love."

"If that is silly, I am the silliest man in London."

"I think you are sometimes—so I tell you fairly."

In the mean time Mr. Neeft had woken from his slumbers. He was in his old arm-chair in the little back room, where they had dined, while Polly with her lover was in the front parlor. Mrs. Neeft was seated opposite to Mr. Neeft, with an open Bible in her lap, which had been as potent for sleep with her as had been the gin-and-water with her husband. Neeft suddenly jumped up and growled. "Where's Polly?" he demanded.

"She's in the parlor, I suppose," said Mrs. Neeft, doubtfully.

"And who is with her?"

"Nobody as hadn't ought to be," said Mrs. Neeft.

"Who's there, I say?" But without waiting for an answer, he stalked into the front room. "It's no use in life your coming here," he said, addressing himself at once to Ontario; "not in the least. She ain't for you. She's for somebody else. Why can't one word be as good as a thousand?" Moggs stood silent, looking sheepish and confounded. It was not that he was afraid of the father; but that he feared to offend the daughter should he address the father roughly. "If she goes against me she'll have to walk out of the house with just what she's got on her back."

"I should be quite contented," said Ontario.

"But I shouldn't—so you may just cut it. Anybody who wants her without my leave must take her in her smock."

"Oh, father!" screamed Polly.

"That's what I mean—so let's have done with it. What business have you coming to another man's house when you're not welcome? When I want you I'll send for you; and till I do you have my leave to stay away."

"Good-by, Polly," said Ontario, offering the girl his hand.

"Good-by, Mr. Moggs," said Polly; "and mind you get into Parliament. You stick to it, and you'll do it."

When she repeated this salutary advice, it must have been that she intended it to apply to the double event. Moggs at any rate took it in that light. "I shall," said he, as he opened the door and walked triumphantly out of the house.

"Father," said Polly, as soon as they were alone, "you've behaved very bad to that young man."

"You be blowed!" said Mr. Neeft.

"You have, then. You'll go on till you get me that talked about that I shall be ashamed to show myself. What's the good of me trying to behave, if you keep going on like that?"

"Why didn't you take that chap when he came after you down to Margate?"

"Because I didn't choose. I don't care enough for him; and it's all no use of you going on. I wouldn't have him if he came twenty times. I've made up my mind, so I tell you."

"You're a very grand young woman."

"I'm grand enough to have a will of my own about that. I'm not going to be made to marry any man, I know."

"And you mean to take that long-legged shoemaker's apprentice?"

"He's not a shoemaker's apprentice any more than I'm a breeches-maker's apprentice." Polly was now quite in earnest, and in no mood for picking her words. "He's a boot-maker by his trade; and I've never said any thing about taking him."

"You've given him a promise."

"No; I've not."

"And you'd better not, unless you want to walk out of this house with nothing but the rags on your back. Ain't I doing it all for you? Ain't I been sweating my life out these thirty years to make you a lady?" This was hard upon Polly, as she was not yet one-and-twenty.

"I don't want to be a lady; no more than I am just by myself, like. If I can't be a lady without being made one, I won't be a lady at all."

"You be blowed!"

"There are different kinds of ladies, father. I want to be such a one as neither you nor mother shall ever have cause to say I didn't behave myself."

"You talk the figures of a milestone," said Mr. Neeft, as he returned to his arm-chair, to his gin-and-water, to his growlings, and before long to his slumbers. Throughout the whole evening he was very unpleasant in the bosom of his family—which consisted on this occasion of his wife only, as Polly took the opportunity of going out to drink tea with a young lady friend. Neeft, when he heard this, suggested that Ontario was drinking tea at the same house, and would have pursued his daughter but for mingled protestations and menaces which his wife used for preventing such a violation of parental authority. "Moggs don't know from Adam where she is; and you never knowed her do any thing of that kind. And you'll go about with your mad schemes and jealousies till you about ruin the poor girl; that's what you will. I won't have it. If you go, I'll go too, and I'll shame you. No; you sha'n't have your hat. Of course she'll be off some day, if you make the place that wretched that she can't live in it. I know I would—with the fust man as'd ask me." By these objurgations, by a pertinacious refusal as to his hat, and a little yielding in the matter of gin-and-water, Mr. Neeft was at length persuaded to remain at home.

On the following morning he said nothing before he left home, but as soon as he had opened his letters and spoken a few sharp things to the two men in Conduit Street, he went off to Mr. Moggs senior. Of the inter-

view between Mr. Neeft and Mr. Moggs senior sufficient has already been told. Then it was, after his return to his own shop, that he so behaved as to drive the German artist into downright mutiny and unlimited beer. Through the whole afternoon he snarled at Waddle; but Waddle sat silent, bending over the ledger. One question Waddle did answer.

"Where's that pig-headed German gone?" asked Mr. Neeft, for the tenth time.

"I believe he's cutting his throat about this time," said Mr. Waddle.

"He may wait till I come and sew it up," said the breeches-maker.

All this time Mr. Neeft was very unhappy. He knew, as well as did Mr. Waddle or Polly, that he was misbehaving himself. He was by no means deficient in ideas of duty to his wife, to his daughter, and to his dependants. Polly was the apple of his eye; his one jewel—in his estimation the best girl that ever lived. He admired her in all her moods, even though she would sometimes oppose his wishes with invincible obstinacy. He knew in his heart that were she to marry Ontario Moggs he would forgive her on the day of her marriage. He could not keep himself from forgiving her though she were to marry a chimney-sweep. But, as he thought, a great wrong had been done him. He could not bring himself to believe that Polly would not marry the young squire, if the young squire would only be true to his undertaking; and then he could not endure that the young squire should escape from him, after having been, as it were, saved from ruin by his money, without paying for the accommodation in some shape. He had some inkling of an idea that, in punishing Ralph by making public the whole transaction, he would be injuring his daughter as much as he injured Ralph. But the inkling did not sufficiently establish itself in his mind to cause him to desist. Ralph Newton ought to be made to repeat his offer before all the world; even though he should only repeat it to be again refused. The whole of that evening he sat brooding over it, so that he might come to some great resolution.

CHAPTER XLVI.

MR. NEEFIT AGAIN.

THE last few days in March and the first week in April were devoted by Ralph the heir to a final visit to the Moonbeam. He had resolved to finish the hunting-season at his old quarters, and then to remove his stud to Newton. The distinction with which he was welcomed by everybody at the Moonbeam must have been very gratifying to him. Though he had made no response whatever to Lieutenant Cox's proposition as to a visit to Newton, that gentleman received him as a hero. Captain Fooks also had escaped from his regiment with the sole object of spending these last days with his dear old friend. Fred Pepper, too, was very polite, though it was not customary with Mr. Pepper to display

friendship so enthusiastic as that which warmed the bosoms of the two military gentlemen. As to Mr. Horsball, one might have thought from his manner that he hoped to engage his customer to remain at the Moonbeam for the rest of his life. But it was not so. It was in Mr. Horsball's nature to be civil to a rich hunting country-gentleman; and it was the fact also that Ralph had ever been popular with the world of the Moonbeam—even at times when the spasmodic, and at length dilatory, mode of his payment must have become matter for thought to the master of the establishment. There was no doubt about the payments now, and Ralph's popularity was increased fourfold. Mrs. Horsball got out from some secluded nook a special bottle of orange-brandy in his favor—which Lieutenant Cox would have consumed on the day of its opening, had not Mrs. Horsball, with considerable acrimony, declined to supply his orders. The sister with ringlets smiled and smirked whenever the young squire went near the bar. The sister in ringlets was given to flirtations of this kind, would listen with sweetest complacency to compliments on her beauty, and would return them with interest. But she never encouraged this sort of intimacy with gentlemen who did not pay their bills, or with those whose dealings with the house were not of a profitable nature. The man who expected that Miss Horsball would smile upon him because he ordered a glass of sherry and bitters, or half a pint of pale ale, was very much mistaken; but the softness of her smiles for those who consumed the Moonbeam champagne was unbounded. Love and commerce with her ran together, and regulated each other in a manner that was exceedingly advantageous to her brother. If I were about to open such a house as the Moonbeam the first thing I should look for would be a discreet, pleasant-visaged lady to assist me in the bar-department, not much under forty, with ringlets, having no particular leaning toward matrimony, who knew how to whisper little speeches while she made a bottle of cherry-brandy serve five-and-twenty turns at the least. She should be honest, patient, graceful, capable of great labor, grasping—with that wonderful capability of being greedy for the benefit of another which belongs to women—willing to accept plentiful meals and a power of saving twenty pounds a year as a sufficient remuneration for all hardships, with no more susceptibility than a milestone, and as indifferent to delicacy in language as a bargee. There are such women, and very valuable women they are in that trade. Such a one was Miss Horsball, and in these days the sweetest of her smiles were bestowed upon the young squire.

Ralph Newton certainly liked it, though he assumed an air of laughing at it all.

"One would think that old Hossy thought that I am going to go on with this kind of thing," he said, one morning, to Mr. Pepper, as the two of them were standing about near the stable-doors with pipes in their mouths.

Old Hossy was the affectionate nickname by which Mr. Horsball was known among the hunting-men of the B. B.

Mr. Pepper and Ralph had already breakfasted, and were dressed for hunting except that they had not yet put on their scarlet coats. The meet was within three miles of their headquarters; the captain and the lieutenant were taking advantage of the occasion by prolonged slumbers; and Ralph had passed the morning in discussing hunting matters with Mr. Pepper.

"He don't think that," said Mr. Pepper, taking a very convenient little implement out of his pocket, contrived for purposes of pipe-smoking accommodation. He stopped down his tobacco, and drew the smoke, and seemed by his manner to be giving his undivided attention to his pipe. But that was Mr. Pep-

per's manner. He was short in speech, but always spoke with a meaning.

"Of course he doesn't really," said Ralph. "I don't suppose I shall ever see the old house again after next week. You see when a man has a place of one's own, if there be hunting there, one is bound to take it; if there isn't, one can go elsewhere and pick and choose."

"Just so," said Mr. Pepper.

"I like this kind of thing amazingly, you know."

"It has its advantages."

"Oh dear, yes. There is no trouble, you know. Every thing done for you. No servants to look after—except just the fellow who brings you your breeches and rides your second horse." Mr. Pepper never had a second horse, or a man of his own to bring him his breeches, but the allusion did not on that account vex him. "And then you can do what you like a great deal more than you can in a house of your own."

"I should say so," remarked Mr. Pepper.

"I tell you what it is, Fred," continued Ralph, becoming very confidential. "I don't mind telling you, because you are a man who understands things. There isn't such a great pull after all in having a property of your own."

"I shouldn't mind trying it—just for a year or so," said Mr. Pepper.

"I suppose not," said Ralph, chuckling in his triumph. "And yet there isn't so much in it. What does it amount to when it's all told? You keep horses for other fellows to ride, you buy wine for other fellows to drink, you build a house for other fellows to live in. You've a deal of business to do, and if you don't mind it you go very soon to the dogs. You have to work like a slave, and everybody gets a pull at you. The chances are you never have any ready money, and become as stingy as an old file. You have to get married because of the family, and the place, and all that kind of thing. Then you have to give dinners to every old fogey, male and female, within twenty miles of you, and before you know where you are you become an old fogey yourself. That's about what it is."

"You ought to know," said Mr. Pepper.

"I've been expecting it all my life—of course. It was what I was born to, and everybody has been telling me what a lucky fellow I am since I can remember. Now I've got it, and I don't find it comes to so very much. I shall always look back upon the dear old Moonbeam, and the B. B., and Hossy's wonderful port wine, with regret. It hasn't been very swell, you know, but it's been uncommonly cosy. Don't you think so?"

"You see I wasn't born to any thing better," said Mr. Pepper.

Just at this moment Cox and Fooks came out of the house. They had not as yet breakfasted, but had thought that a mouthful of air in the stable-yard might enable them to get through their toast and red herrings with an amount of appetite which had not as yet been vouchsafed to them. Second and third editions of that wonderful port had been produced on the previous evening, and the two warriors had played their parts with it manfully. Fooks was bearing up bravely as he made his way across the yard; but Cox looked as though his friends ought to see to his making that journey to Australia very soon if they intended him to make it at all. "I'm blessed if you fellows haven't been and breakfasted," said Captain Fooks.

"That's about it," said the squire. "You must be uncommon fond of getting up early."

"Do you know who gets the worm?" asked Mr. Pepper.

"Oh, bother that," said Cox.

"There's nothing I hate so much as being told about that nasty worm," said Captain Fooks. "I don't want a worm."

"But the early birds do," said Mr. Pepper.

Captain Fooks was rather given to be cross of mornings. "I think, you know, that when fellows say overnight they'll breakfast together, it isn't just the sort of thing for one or two to have all the things brought up at any unconscionable hour they please. Eh, Cox?"

"I'm sure I don't know," said Cox. "I shall just have another go of soda-and-brandy with a devilled biscuit. That's all I want."

"Fooks had better go to bed again, and see if he can't get out the other side," said Ralph.

"Chaff doesn't mean any thing," said Captain Fooks.

"That's as you take it," said Mr. Pepper.

"I shall take it just as I please," said Captain Fooks.

Just at this moment Mr. Horsball came up to them, touching his hat cheerily in sign of the commencement of the day. "You'll ride Mr. Pepper's little 'orse, I suppose, sir?" he said, addressing himself to the young squire.

"Certainly—I told Larking I would."

"Exactly, Mr. Newton. And Banker might as well go out as second."

"I said Brewer. Banker was out on Friday."

"That won't be no odds, Mr. Newton. The fact is, Brewer's legs is a little puffed."

"All right," said the squire.

"Well, old Hossy," said Lieutenant Cox, summing up all his energy in an attempt at maternal joviality, as he slapped the landlord on the back, "how are things going with you?"

Mr. Horsball knew his customers, and did not like being slapped on the back with more than ordinary vigor by such a customer as Lieutenant Cox. "Pretty well, I thank you, Mr. Cox," said he. "I didn't take too much last night, and I eat my breakfast 'early this morning."

"There is one for you, young man," said Captain Fooks. Whereupon the squire laughed heartily. Mr. Horsball went on nodding his head, intending to signify his opinion that he had done his work thoroughly; Mr. Pepper, standing on one foot with the other raised on a horse-block, looked on without moving a muscle of his face. The lieutenant was disgusted, but was too weak in his inner man to be capable of instant railleury; when, on a sudden, the whole aspect of things was changed by the appearance of Mr. Newton in the yard.

"D—tion!" exclaimed our friend Ralph. The apparition had been so sudden, that the squire was unable to restrain himself. Mr. Neeft, as the reader will perhaps remember, had been at the Moonbeam before. He had written letters which had been answered, and then letters—many letters—to which no reply had been given. In respect of the Neeft arrangements, Ralph Newton felt himself to be peculiarly ill-used by persecutions such as these, because he had honestly done his best to make Polly his wife. No doubt, he acknowledged that Fortune had favored him almost miraculously, in first saving him from so injurious a marriage by the action of the young lady, and then at once bestowing upon him his estate. But the escape was the doing of Fortune and Polly Neeft combined, and had not come of any intrigue on his own part. He was in a position—so he thought—absolutely to repudiate Neeft, and to throw himself upon facts for his protection; but then it was undoubtedly the case that, for a year or two, Mr. Neeft could make his life a burden to him. He would have bought off Neeft at a considerable price, had Neeft been purchasable. But Neeft was not in this matter greedy for himself. He wanted to make his daughter a lady, and he thought that this was the

readiest way to accomplish that object. The squire, in his unmeasurable disgust, uttered the curse aloud; but then, remembering himself, walked up to the breeches-maker with his extended hand. He had borrowed the man's money. "What's in the wind now, Mr. Neeft?" he said.

"What's in the wind, captain? Oh, you know. When are you coming to see us at the cottage?"

"I don't think my coming would do any good. I'm not in favor with the ladies there." Ralph was aware that all the men standing round him had heard the story, and that nothing was to be gained by an immediate attempt at concealment. It behooved him, above all things, to be upon his metal to put a good face upon it, and to be at any rate equal to the breeches-maker in presence of mind and that kind of courage which he himself would have called "check."

"My money was in favor with you, captain, when you promised as how you would be on the square with me in regard to our Polly."

"Mr. Neeft," said Ralph, speaking in a low voice, but still clearly, so that all around him could hear him, "your daughter and I can never be more to each other than we are at present. She has decided that. But I value her character and good name too highly to allow even you to injure them by such a discussion in a stable-yard." And, having said this, he walked away into the house.

"My Polly's character!" said the infuriated breeches-maker, turning round to the audience, and neglecting to follow his victim in his determination to vindicate his daughter. "If my girl's character don't stand higher nor his or any one's belonging to him, I'll eat it!"

"Mr. Newton meant to speak in favor of the young lady, not against her," said Mr. Pepper.

"Then, why don't he come out on the square? Now, gents, I'll tell you just the whole of it. He came down to my little box, where I and my missus and my girl lives quiet and decent, to borrow money; and he borrowed it. He won't say as that wasn't so."

"And he's paid you the money back again," said Mr. Pepper.

"He have; but just you listen. I know you, Mr. Pepper, and all about you; and do you listen. He have paid it back. But when he come there borrowing money, he saw my girl; and, says he—I've got to sell that 'eritance of mine for just what it'll fetch.' 'That's bad, captain,' says I. 'It is bad,' says he. Then says he again, 'Neeft, that girl of yours there is the sweetest girl as ever I put my eyes on.' And so she is—as sweet as a rose, and as honest as the sun, and as good as gold. I says it as oughtn't; but she is. 'It's a pity, Neeft,' says he, 'about the 'eritance; ain't it?' 'Captain,' says I—I used to call him captain 'cause he come down quite familiar-like, to eat his bit of salmon and drink his glass of wine. Laws, he was glad enough to come then, mighty grand as he is now."

"I don't think he's grand at all," said Mr. Horsball.

"Well; do you just listen, gents. 'Captain,' says I, 'that 'eritance of yours mustn't be sold nohow.' I says so. 'What's the figure as is wanted?' Well; then he went on to say as how Polly was the sweetest girl he ever see; and so we came to an understanding. He was to have what money he wanted at once, and then twenty thousand pounds down when he married Polly. He did have a thousand. And, now—see what his little game is."

"But the young lady wouldn't have any thing to say to him," suggested Captain Fooks, who, even for the sake of his break-

fast, could not omit to hear the last of so interesting a conversation.

"Laws, Captain Fooks, to hear the likes of that from you, who is an officer and a gentleman by Act of Parliament! When you have any thing sweet to say to a young woman, does she always jump down your throat the first go-off?"

"If she don't come at the second time of asking I always go elsewhere," said Captain Fooks.

"Then it's my opinion you have a deal of travelling to do," said Mr. Neeft, "and don't get much at the end of it. It's because he's come in for his 'eritance, which he never would have had only for me, that he's demeaning himself this fashion. It ain't acting the gentleman; it ain't the thing; it's off the square. Only for me and my money there wouldn't be an acre his this blessed minute; d—d if there would! I saved it for him, by my ready money—just that I might see my Polly put into a station as she'd make more genteel than she found it. That's what she would; she has that manners, not to talk of her being as pretty a girl as there is from here to—anywheres. He made me a promise, and he shall keep it! I'll worry the heart out of him else. Pay me back my money! Who cares for the money? I can tell guineas with him now, I'll be bound. I'll put it all in the papers—I will. There ain't a soul shan't know it. I'll put the story of it into the pockets of every pair of breeches as leaves my shop. I'll send it to every M. F. H. in the kingdom."

"You'll about destroy your trade, old fellow," said Mr. Pepper.

"I don't care for the trade, Mr. Pepper. Why have I worked like a 'orse? It's only for my girl."

"I suppose she's not breaking her heart for him?" said Captain Fooks.

"What she's a doing with her heart ain't no business of yours, Captain Fooks. I'm her father, and I know what I'm about. I'll make that young man's life a burden to him, if 'e ain't on the square with my girl. You see if I don't.—Mr. 'Orsball, I want a 'orse to go a 'unting on to-day. You lets 'em. Just tell your man to get me a 'orse. I'll pay for him."

"I didn't know you ever did any thing in that way," said Mr. Horsball.

"I may begin if I please, I suppose. If I can't go no other way, I'll go on a donkey, and I'll tell every one that's out. Oh, 'e don't know me yet—don't that young gent."

Mr. Neeft did not succeed in getting any animal out of Mr. Horsball's stables, nor did he make further attempt to carry his last threat into execution on that morning. Mr. Horsball now led the way 'into the house, while Mr. Pepper mounted his nag. Captain Fooks and Lieutenant Cox went in to their breakfast, and the unfortunate father followed them. It was now nearly eleven o'clock, and it was found that Ralph's horses had been taken round to the other door, and that he had already started. He said very little to any one during the day, though he was somewhat comforted by information conveyed to him by Mr. Horsball in the course of the afternoon that Mr. Neeft had returned to London.

"You send your lawyer to him, squire," said Mr. Horsball. "Lawyers cost a deal of money, but they do make things straight."

This suggestion had also been made to him by his brother Gregory.

On the following day Ralph went up to London, and explained all the circumstances of the case to Mr. Carey. Mr. Carey undertook to do his best to straighten this very crooked episode in his client's life.

APPLETONS' JOURNAL

of LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington

No. 102.—VOL. V.]

SATURDAY, MARCH 11, 1871.

[PRICE TEN CENTS.]

MIGNON. See page 286.

THE TWO LOVERS.

"O MAMMA!" exclaimed Josephine Rawson, as a middle-aged, motherly lady came into the room, where she, Dr. Houghton, and myself, were sitting together in the summer twilight, "this is Dr. Houghton's birthday, and he is thirty-seven; I wouldn't tell it if I were he, would you?"

"And why not, my child?" said Mrs. Rawson; "thirty-seven is not old, at least not for a man; and years are not a thing to be ashamed of."

"That sounds just like Aunt Jenny," said the young lady; "she is always telling her age when there is no need of it;" and, turning to me, "I am sure if I live to be as old as you, aunty, I'll take off a year or two, especially if I am an old maid."

"And why should the fact of being an old maid make one less candid in the matter?" I answered. "I should certainly like to be younger, but I cannot deceive myself, and shall not try to deceive others."

"Well, you are the strangest woman, aunty!—Now, doctor, just see if you can guess her age; if you do, she will own it."

"I do not suppose Dr. Houghton is particularly interested on the subject," I replied; "but I will save him the trouble of guessing." And as that gentleman, who seemed rather embarrassed by the turn the conversation had taken, raised his eyes to my face, with a half-annoyed and half-amused expression, I spared him the necessity of speaking, by saying that, in just one month from that day, I should be thirty-six years old.

"Miss Rawson was correct," replied the doctor; and, turning to me, "I should have supposed you younger, Miss Hartley, for Time has not told quite so plainly and unmistakably upon your face as he has upon my own; your life has been less rough, I imagine—may it be so always!"

So serious was the tone in which the last words were spoken, that silence fell upon us all for a few moments. Presently we heard a light footstep on the sidewalk; and the doctor, catching the sound, exclaimed:

"Ah! that is the 'Inevitable'—I know his step. I think that boy of mine is engaged in a conspiracy with all the invalids of the neighborhood against my peace. No sooner am I settled for a comfortable evening, either alone or in company, than he manages to get up a patient for my especial discomfort. So, ladies, I must bid you good-night, wishing you a pleasanter one than mine is likely to be, I fear." And then he left us.

"It's too bad!" cried Josephine, petulantly; "Dr. Houghton is better than no beau at all, old as he is—and now it is so late, I am sure no one else will come to-night, though, of course, you don't care; I believe you would like to be alone half the time. But I think it is awfully stupid, and am going to bed. Come up and sit with me till I am sleepy;" and she rose and waited for me to follow.

"Josie, I am not quite ready to go yet," I said, "it is so pleasant here; but I will come soon."

"O dear! I think you might come, just to please me, whether you want to or not; but I won't tease you;" and the girl, who was rather wilful and thoughtless than really unkind, kissed me, and left me to myself.

And now I must pause to tell you, reader, who and what we are, who are brought thus suddenly and unceremoniously before you.

To begin at the beginning. We were all residents of the little city of Hampstead, though neither Dr. Houghton nor myself had been born or bred there. He had come to the place, from a distant State, some thirteen years before the time at which my story opens, bringing with him sufficient credentials of respectability to satisfy the most exclusive of our townsfolk; a limited amount of means, as was inferred from his modest way of living, and a pretty, helpless, sickly, and fretful wife, of whom every one but himself complained bitterly.

He had married her, it was said, against the wishes of his own family, who were much above hers in social position, when he was but nineteen, and she two years younger.

Never did married pair exhibit a greater contrast. She, childish, exacting, unreasonable, threw herself upon her husband, a mere heavy, galling burden.

He, manly, patient, forbearing, took her up, tenderly and uncomplainingly, and bore the weight silently until the end. Whatever he

may have thought of her shortcomings, or of his own mistake and its heavy and bitter retribution, no word of blame for her, or pity for himself, escaped him, until he came at last to lay her down to rest, under the daisies of the church-yard, where now, for five years, she had "slept well."

The modest sign bearing the name of "Felix Houghton, M. D.," and embellishing at first the window of a very humble boarding-house in the outskirts of the town, had gradually advanced toward a better locality, with the increasing practice and popularity of its owner, until now his name shone on the door-plate of a large and comfortable residence on one of our most desirable avenues, and his carriage was seen on our streets much oftener than the old-fashioned chaise of even our oldest physician.

For Dr. Houghton, bending over a sick-bed, had a very pleasant face to look upon, as they who had need of him were not long in learning. Not that he was handsome, far from it; for his face was sallow and care-worn, and his hair was prematurely gray. But his dark eye always met yours fearlessly and honestly, and his voice had in it a sort of sweet and comfortable assurance, no matter how little there might be in the spoken words themselves. His touch, soft as a woman's, was yet firm as it was tender, and his smile, ah! who so sick as not to feel it strengthen him like a sweet restorative?

Mrs. Rawson, with whom I had recently come to make my home, and who was my senior by some years, had been the wife of my only brother, who died, leaving her childless. After his death, she had married again, and was now, for the second time, a widow. Her family had, till I came, consisted of herself and one daughter, who, at eighteen, was thoughtless, pretty, and impulsive, with a little selfishness, and too much romance in her composition to listen patiently to her mother's oft-repeated praises of Dr. Houghton, whose partiality to the daughter was most acceptable to her heart.

"Do you want to marry a boy?" Mrs. Rawson would ask, when her daughter referred to the gentleman's age.

"A boy!" why, mother, Dr. Houghton is more than twice my age. He has forgotten what love is by this time, if he ever knew. And he is so odd, he never pays me compliments, nor gives me presents, like—like other gentlemen."

"Like Phil Singleton, for instance," the mother would answer.

"Yes, like Phil Singleton. Oh, he's perfectly splendid. He thinks I never had a fault, in which opinion I am sure the doctor would not agree. But then I would not lose his friendship for the world; and I do like to talk with him, especially when Phil looks so jealous."

"You will either change your tune yet, my young lady, or be sorry that you did not," the mother would respond. And so the discussion would end for the time, to be renewed at pleasure.

But I am forgetting to tell you of myself. First, as you will have seen already, I was an old maid. My sister-in-law always called me "Aunt," as if my only claim to any sort of regard was my relationship to her daughter. All young persons, and many of my own age, addressed me, usually in a sort of commiserating way, as "Aunt Jenny," and inquired after my health as if a spinster of my years must, of necessity, be suffering from physical or mental infirmity.

When I came to live with Mrs. Rawson, I had been recently left, by the death of my father, with a competence, but with no nearer relative than my sister-in-law; I had passed most of my life in the country, and wanted now to come to Hampstead and take a house of my own.

This my sister most decidedly objected to. She said, "It would look so strange for me to live alone, as I had never been married; people would certainly talk;" and so, more especially as I felt very lonely, I consented for the present to take up my abode with her.

When I had been settled for a week or two, and had seen most of her friends, and heard the histories even of those I had not seen, that of Dr. Houghton among the rest, that gentleman dropped in one evening, and I was introduced to him by Josie, simply as "My aunt."

"I beg pardon!" said the doctor, politely appealing to her; "I did not understand the lady's name."

Josephine looked almost puzzled at first, as if she wondered why any one should wish to understand my name, and replied: "Miss Hartley—I beg your pardon, doctor, and yours too, Aunt Jenny; but I forgot you had any other name."

And Miss Hartley I always was to Dr. Houghton, though my sister considered it a rather unnecessary and affected degree of politeness, and used to say:

"I wonder if he will keep it up when you get to be his aunt in earnest, for I think Josie will have him yet, don't you? Certainly he comes oftener lately, and stays longer, than he ever did before."

About the final result of these visits I was not quite so clear myself. For, though I knew Josephine was well pleased with the idea that a man so superior in mind and worldly advantages should be led captive by the power of her charms, I was sure that Dr. Houghton was much too grave and old to suit her notions of a lover; and that handsome and dashing Phil Singleton, who continued, Heaven knows how, to make a greater show of wealth with a few hundreds a year than the doctor with his few thousands, came much nearer to her ideal.

"Philip Singleton, attorney-at-law," was a young gentleman of twenty-three, or thereabouts, whose father had recently "set him up," and whose principal business, as yet, consisted in watching for, and bowing to, the pretty girls who passed his office, and in waiting for clients who, as yet, were few and far between! For the rest, he was handsome, harmless, and desperately enamoured with Miss Josephine Rawson.

Many a pleasant evening did he spoil for us, or I should rather say for me, during my first season at Mrs. Rawson's. Dr. Houghton, when he visited us, usually came early in the evening; often before we had left the tea-table, always inquiring for "the ladies," which sometimes quite piqued Josephine, as it was generally the custom of single gentlemen in Hampstead to ask only for the one young lady they had a particular desire to see.

Sometimes she threatened us with not coming into the parlor at all; as she "presumed he came to see mamma and aunty;" but, as the doctor at such times only made the proper inquiries in reference to her health, and manifested no particular uneasiness, she was fain to join us at last, more especially because she knew Mr. Singleton was likely to drop in later in the evening, and she would never willingly lose the chance of flirting with him, and all the better if it could be done in the presence of Dr. Houghton.

It was also necessary, as she knew, if she wished to make the most of her opportunity, that she should be on the ground at the moment of Phil's arrival; as that event was very likely to remind the doctor, before long, either that he had a professional engagement, or that his having fulfilled one the night before had "rendered him unpardonably dull, and unfit for the society of ladies."

He never showed any mean jealousy or dislike of his rival: on the contrary, he was ceremoniously polite and courteous; but somehow, when Phil joined us, the conversation almost always took a new and more constrained tone; none of us ever felt quite as comfortable, I think, as before, always excepting Josephine.

From the first day of my acquaintance with him, I liked our friend and neighbor, and, when I began to think that he was ultimately to occupy a new and nearer relation to me, I was heartily glad. And yet the better I liked him, the more I was vexed with Josephine, that she did not quite appreciate his true nobleness of character.

Then I began to wonder how a man of cultivated tastes, ripe judgment, and settled habits of life and thought, and especially one who, if report spoke truly, had paid such a heavy price for the folly of an ill-assorted alliance, should fancy one whose shortcomings were so manifest, even to himself. For often had I seen him, though evidently not insensible to the charm of her youth and beauty, turn almost sorrowfully away from her thoughtless gayety, to talk with me, upon what Josie considered "such horrid, stupid subjects," that we two were often left to ourselves; and many a time we sat deep into the summer night, revelling in the pleasant regions of poetry and romance.

"She is not worthy of him," I would say to myself, "and I am angry and indignant with him that he can be so blinded by her mere beauty of person! If she were only a little older and steadier, and a little more in sympathy with his tastes and pursuits, or if there were enough in her ever to learn to comprehend his larger nature, and to sympathize with him—but no, it will not and it cannot come to good." Sometimes I thought, if he were going to marry some one I liked as well as I did himself, how pleasant it would be to me; and then I would run over, in my thoughts, the list of my lady friends, and always to find that none of them would be quite to my mind, even if they were to his, and to end with a sigh, at the blind perversity of Love.

Pleasantly and quietly the summer and autumn passed away with us all. Dr. Houghton's courtship made, as it seemed, very little

progress. Sometimes Josephine was very gracious to him, and again she seemed almost offensively indifferent.

Nevertheless, he remained mostly calm and unruffled, never seeming to feel annoyed, nor to come or go any whit later or sooner, for all her moods and caprices.

"Josephine," said Mrs. Rawson, a little sharply, one evening, "I am really provoked with you; and I should not be surprised if you try the doctor beyond what even he will bear yet. He is only too good for you, and, what is more, he may find it out."

"Well, let him!" replied the daughter, in a gay, defiant tone. "He is not the only man in the world. And, besides, he is so stupid—no, not that, exactly—but he's so odd. Why, he divides all his attentions so impartially between you and me and aunty, that I am sure I can't tell yet which of us he likes best. Now, wouldn't it be funny if, after all, I should have to learn to call him 'Papa!'" and she laughed very merrily at the conceit.

"How ridiculous you are!" said the mother, half laughing, in spite of herself, at the girl's absurdity. "The doctor wouldn't thank you for the compliment you pay his taste, in supposing he visits here for the pleasure he finds in the society of two old women; but it's just like you, to talk so; I do believe that little Phil Singleton has turned your head!"

"Little Phil Singleton, indeed!" cried the now really irritated young lady. "Little Phil Singleton is larger than Felix Houghton, M. D.! And suppose he did turn my head? my head is my own, I hope!"

"I hope so, and your heart too; you will certainly never give it to that fellow with my consent! A pretty match that would be!"

"I think so too, mother; though, to tell the truth, I never thought seriously about it till now; but if there is no other escape from the old doctor, I may be driven to Phil yet, in sheer desperation."

"Old doctor! oh dear me," exclaimed the mother; and then, feeling too indignant to pursue the controversy, she left the field in the possession of her very provoking adversary.

Such conversations seemed to have but little effect in changing the position of affairs. Nevertheless, Mrs. Rawson still continued hopeful that matters would eventually take the turn she so much desired. For myself, I almost feared to believe she was right, and that Josephine, thoughtless and careless as she was, could not long remain insensible to the advantages of such an alliance.

Hampstead was a very quiet place, and, during all my first winter, there occurred no event among its inhabitants worth recording. And now, as I look back over the time that passed, after the chilling winds of autumn drove us from the open windows to the cheerful wood-fire on the hearth until the spring breezes called us back again, all the season seems like one long, happy day.

Yet how swiftly the shadow was stealing on that should darken all my world! For there came a time, following close on my day of brightness, when, though I took shame to myself to own the truth, even in the darkness and solitude of the night, I knew too well that I, madness though it might be, could love him, whose devotion was so little prized by her who reached no hand to take it!

One night—I can recall it very distinctly, it was in the early spring—I sat by the open window of my own quiet room, and saw the night drop the slender bow of the new moon out of her hand into the darkness; and then I turned my face and my thoughts from the outer world, and communed long and sorrowfully with my own heart. I accused myself of weakness, of folly, of madness. I do not think there was another mortal in the whole world at that hour who, knowing all that I knew, would have felt such scorn and contempt for me as in that solitary conflict I felt for myself. And yet, what could I do? I knew now that the thing I had so often and so solemnly resolved not to do was already done. I loved where there was no possibility of any return; where I had known from the first that it must be so; and, if in the very face of this knowledge I could fall into such a depth of folly, where was the hope that I could ever rise from it again! Sometimes I resolved to go away. Then I said that flight would be cowardly, and that I would face and overcome the danger; and told myself that seeing constantly before me the proof of the utter hopelessness of my passion, would be the most certain means of effecting its cure. One thing, at least, I was sure I could and would do. I could hide my secret safely in my own bosom. This would not be very difficult to do, more especially as no one near me, certainly not they of my own household, ever imagined that such frail

and perishable things as human affections survived the period of early youth.

So you will see that my secret, after all, was not so hard to keep; but the fact that it must be kept made it hard to bear. Indeed, I know not how I should have done so well as I did, if Fate had not been kind to me, though, at any other time, her interposition would have seemed like cruelty.

When the advance of the spring had made the world without pleasant for the eyes to behold, I began to take long walks daily; partly for my health, but more especially to divert my mind and weary my body, so as to bring the old refreshing sleep to my pillow that now came not always at my bidding.

One pleasant afternoon, I set out on my rambles, and had strayed far beyond the town, when suddenly I found the sun withdrawn under a heavy curtain of clouds, and, turning about, I made such haste as I could to find some shelter from the rapidly-gathering shower. But, fast as I walked, the rain overtook me before I had reached the first place of refuge near me, which happened to be a police-station. A man who seemed to have charge of the place invited me to come within, where a group of men were gathered round a little fire, and I would fain have availed myself of his kindness and dried my wet shawl; but the room was full of tobacco-smoke, and the men were noisy and uninviting; so I said that I was not much wet, and preferred to remain outside and watch the storm. And a storm it really proved to be. The wind blew most fearfully, and the rain literally poured down from the clouds, as gaping fissures were made in their blackness by the red spears of the lightning.

By making inquiries, I learned that a stage would pass the place in about an hour, by which I might be conveyed safely to my own home, and as the roads would be quite muddy, even when the storm, which was now subsiding, should cease, I concluded to wait with what patience I might.

Toward sunset the rain ceased, the clouds rolled away, and the sun came out for a moment, as if to see how the earth looked after her fearful baptism.

Consulting my watch, I found I had yet half an hour to wait, and, quietly resigning myself, I sat looking on the spires of the city, and falling into a sort of dreamy reverie, when a carriage, the noise of whose coming I had not noticed, halted suddenly before me, and a pleasant and familiar voice cried out:

"Good-evening, Miss Hartley! I am really sorry to see you here; but, if your offence is a bailable one, I shall be most happy to become your surety, and convey you safely back to your afflicted friends."

And there, smiling pleasantly before me, was the man toward whom all my thoughts were even at that moment tending. I was indignant with myself to feel that I started at the sound of his voice, and murmured my excuses for being found there; as if he could know what was in my mind, or as if our chance meeting had been by my design.

"Nay, you had better make no explanations or confessions to me," he said, "since I am neither counsellor nor priest. And, though I know not of what you stand accused, I see by your manner that you are guilty, and, as a friend, advise you not to criminate yourself. But seriously, Miss Hartley, you will return with me, will you not?"

"Many thanks," I answered; "you have saved me another tedious half-hour's waiting, besides bestowing upon me much pleasanter company than I should have been likely to encounter in a stage. This ill wind has blown some good to me, if to no one else."

And, quite recovered from my confusion, I rose and came forward, while the doctor, alighting, unfastened the apron, and turned the wheel of his carriage for my better accommodation.

"Be a little careful of the step," he said, "it is wet and slippery; and allow me to guard your dress, as my wagon is not especially adapted to ladies' costumes. There! I think, between us we have managed to surmount all the difficulties."

And, placing me carefully in the seat, he took his own beside me, and, possessing himself of the reins, gave his jaded horse the permission to start in the direction of his stable.

"This is the only thing at all approaching to an adventure that I have yet met with," I said, by way of saying something, "and I have taken my walks abroad, of late, in a variety of unexplored regions."

"Do you often stray so far from home, and in all weathers? If so, I should advise you, as a physician, to be more thoroughly protected than to-day, for I see you have no umbrella, and your shawl is

quite wet and not thick enough," and he laid his hand on my arm. "Really, if it were Josephine who had done so imprudent a thing as this, I should not be so much surprised, and should rather feel inclined to scold; but you are not quite young enough to be excused, and a little too old to be reprimanded. What shall I do in such a case, Miss Hartley?"

"Pray, do nothing, doctor, since you are in no way responsible for my conduct, and since any trouble given yourself on my account might be entirely useless; for, I assure you, I am exceedingly perverse."

"Yes, so I should judge; you are true to the reputation of your sex; but can you not be persuaded nor entreated? Could you not yield a point, if one said, Do this, or refrain from that, because it is best, and because I ask it?"

"Oh, in that case I should be the veriest slave to the will of another. It is only unwarrantable interference or opposition that arouses my resistance; I yield very readily to kind treatment, I assure you."

"Yet I thought, at first, you were almost inclined to refuse my slight service when I proposed to bring you into the city. You certainly looked taken by surprise, and not eager to accept it."

"You quite misinterpreted my manner, doctor; I was in dream-land when your voice woke me, and could not immediately come back to the sober certainties of life. Its follies are the only part of youth that I have not yet outgrown."

"You give me great comfort, Miss Hartley," replied my friend, speaking in a lower and more earnest tone than he had yet used; "for, however sober and matter-of-fact I may appear to others, I too have lived, perhaps, too much of late, in the land of dreams. I know the earth where I walk is not firm under my feet, yet I cannot go back."

So long as our conversation had taken a tone of *badinage*, I had found no difficulty in sustaining my part; but now I understood his meaning, and knew he wished to speak to me more plainly and confidentially. I shrank from hearing more, fearing lest I should betray myself, if he were permitted to proceed. And, thinking of no better way by which to change the subject of our talk, I complained of feeling chilly, which I really did; for, as the evening drew on, I began to realize some unpleasant effects from my recent wetting.

Dr. Houghton looked surprised, almost pained, when my abrupt remark seemed to prove how little I was interested in what he had been saying. But, recovering himself directly, he appeared to forget every thing but what appertained to his profession, and became all-engrossed in fears for my health, and a desire to get me home as soon as possible.

Very closely and carefully he wrapped the carriage-robe about me, and, urging his horse to a quicker pace, he soon brought me to the end of my journey.

There, with many kind and minute instructions as to the precautions necessary to be used, in order to prevent my taking cold, the doctor left me, promising to call the next evening to see how carefully I had attended to his orders, and to ascertain what the effect had been.

I went to my room that night, after taking a cup of tea, feeling in a sort of miserable mood, and altogether too helpless to care for myself, or follow the advice so kindly given me. After passing a most uncomfortable night, I felt, though not unable to rise, quite disinclined to make the effort to do so. Toward evening, however, I roused myself sufficiently to leave my bed and make an attempt to dress; but I felt so much worse as to be unequal to the task, and was obliged to confess that I had taken cold, and that I was really ill.

Now, do not, I pray you, imagine that my illness was the "low, nervous fever" of a heroine suffering from disappointed affection; for, sick as I was at heart—and I own it all—I was, till now, strong enough in mind and body. I had a fine constitution, and had all my life known the most perfect health, and my mind was still clear, and my will pretty firm and strong—so strong, that I was still resolved to live, and to live in such a way as to preserve the respect of the world, and, above all, to keep my own, hard as the task might prove.

For the last twelve years my duties as a daughter had kept me closely beside an invalid father. I had had no society, no books, and almost no thought, that he did not share. I had had some glimpses in that time of persons of culture and refinement, who suggested to me another and more delightful world than mine, wherein my more favored

sisters dwelt, and were blest. I had read of men, and even met them sometimes, who awakened the thought, *such a one as that I too could have loved*; but, for the most part, I put such thoughts aside as not for me; and, if ever I forgot the sober realities of my life, it was when I shut my eyes to all I had seen or known, and saw visions and dreamed dreams.

But to return to the present. True to his promise, Dr. Houghton came the next evening, making many very particular inquiries about me. I was not well, Mrs. Rawson informed him, but not so ill as to need medical advice, and hoped to be down-stairs again in a day or two.

This was in accordance with my wishes, as I really did intend, if possible, to subdue without help the enemy that was trying to gain the mastery of me; but, by the second evening of my trial, even my will was vanquished, and, for almost the first time in my life, I was utterly helpless.

"If Dr. Houghton comes to-night," I said to my sister-in-law, who was sitting with me and trying to talk me into feeling better, "tell him to come up. I am too sick to do any thing more for myself, and I do not know as any thing can be done for me; but you may all try."

"Why, Jenny! it is not like you to talk so, you must not be so easily discouraged; the doctor will have you up again in a few days—and I know he is coming to-night, for I heard him tell Josie he would come without fail; so let me smooth your hair, and make you presentable."

"Oh, no," said Josie, who now came smiling into my room, looking so radiant and beautiful that, for the moment, I almost turned from her, with a groan, at the contrast thus presented to my own condition; "let me wait on aunty, mother—I am sure I can do it without annoying her at all.—For you know how well I love to comb your hair, it is so soft and pretty; I like to handle it, and now I may do it as much as I please, mayn't I, you dear, good, sick aunty?"

And, even while she talked, she had propped me up comfortably, and was passing her cool fingers over my burning head. Gay and thoughtless as she was, all her selfishness, and all her frivolity, seemed to be left outside the threshold. In the sick-room she was nothing but tenderness and self-forgetfulness.

"There, aunty," she said, when she had arranged me to her satisfaction, "you never looked so pretty in your life. The fever has just given color enough to your cheeks, and your eyes sparkle like diamonds. I declare, you're quite a beauty."

"Thank you, Josie dear, I do feel very much better, and I am sorry to have you go and leave me; but I hear the door-bell, and I know you will be asked for, so you may as well go down now, and save Annie the trouble of coming for you."

"Oh," she said, "that is only the doctor, I know his decided way of ringing; but I'll go and send him up, and make you entertain him for a while, for you know you promised to see him to-night."

"Yes," I said, "let him come." And then Josephine brought a chair to the bedside, softly closed the door, and went out.

In a little while I heard a light step passing up the stairs and along the passage, and behind that a heavier and firmer tread, whose echo did not drive back any jot of the color already burning in my face.

"There she is, doctor," cried Josie, leading the way into my room. "Now, does she appear like a sick woman? shouldn't you rather say she looked well? Come, be honest."

"I should not say that Miss Hartley looked like a well woman," replied Dr. Houghton, as, coming forward, he looked earnestly and very kindly in my face; and then, taking the seat placed for him, he softly lifted my hand from the counterpane and held it in his own, as he continued: "I feared this—and now we must see what can be done for you; I wish I could have seen you last night, but it is better now than later. Do you know what a lovely evening you are losing by being shut up here, and will you allow me to put back the curtain a little that you may see the sunset?"

I assented, and, while he was arranging the shade and drapery to his liking, there came a light knock at the door, and Annie, looking in, announced "Mr. Singleton, for Miss Rawson," whereupon Josie silently made her exit, and the doctor came back and seated himself near my pillow again.

Not a word more did he say in reference to my condition or its cause. No minute directions did he give, and no learned prescriptions did he write. Some cooling draught he prepared for me, and accorded me unlimited freedom in the use of cold water. In reference to diet, he told me not to be troubled in the least, because I had no desire for

food, as my appetite would doubtless be found in good time, and that, whenever it was, I might eat, but in moderation, of whatever dishes I wished. Then he turned the talk to other topics, but always keeping to such as were of a cheerful and healthful nature; and when the last color had faded out of the west, and silence had fallen upon us, all my pain and all my fever were vanished and forgotten.

Presently Annie came back to light the lamps, and then the doctor rose, and, shading them down to a sort of soft twilight, said: "I must leave you now to visit some patients who have greater need of me than even you have."

"Indeed, doctor, I feel that I do not need you at all. I think this may be your first and last professional visit to me. See! I have no fever now, and I am almost certain I shall sleep."

The doctor smiled, incredulously, as he answered: "I hope you may, and do not wish to discourage you; but I half suspect you have a new lesson to learn, and one rather hard for you, I imagine, namely, dependence. Perhaps you are too self-willed—we shall see; at any rate, having once admitted me to the privilege of a physician, I shall abate no jot of my professional prerogative. You are neither to rise, walk, nor sleep, without my gracious permission, so you may as well yield gracefully; and now, good-night. About this time to-morrow evening I will see you again, unless you need me before, in which case do not fail to send for me," and he was gone.

Dr. Houghton was right. The fever was only held at bay a moment by a strong, skilful hand; not conquered, and was not to be, until after many weary, weary weeks of hard struggle on the part of both of us.

Almost every evening during that time did he visit me; sometimes he sat with me for an hour, sometimes barely looked in, for his practice was very large; then again he and Josephine would spend an entire evening in my room, or he would stay alone with me for a little while and return to the parlor, and then I would lie awake and listen to the pleasant murmur of voices below, turn my face to the wall, and cry out in utter desolation for some help outside my weak and miserable self.

As the spring ripened into summer, I grew better, and began to sit up once more. I had never wished to die, never thought that I should, nor did any one else imagine me in a dangerous condition; but I had been very ill, and was far from being well or strong, and besides, with my weakness, I had grown cowardly; and now as the time drew near when I must take up my burden and my march of life again, I dreaded to make the effort.

"I do wish mother would let me alone," said Josephine, as she came into my room one day, just after I had begun to sit up again. "I would not trouble you while you were so sick, but I think it's too bad!"

"What is too bad, my dear?" I said; "I am sure your mother wishes nothing but what is for your good."

"Why, I am sick and tired of hearing her praise the doctor, to the disparagement of Phil. I am sure he is not so awfully wicked, if he does smoke a cigar sometimes, and has not a good house like Dr. Houghton. What do you think, aunty? which one shall I have?"

"And must you come to a decision now, darling? Has either of them asked you?" I said, almost dreading to hear her reply. For, since I had kept my room, I had heard but little of how matters progressed below.

"Phil has," she said, blushing, "and I put him off; but I can't do it long, he's so impatient; and oh, aunty, I do believe I love him! but then I know the other is the wisest and the best;" and, changing her tone, she cried out, "What do you think is the latest news in Hampstead? it's about Dr. Houghton."

I shook my head.

"He is making all sorts of changes in his house, so they say, and I saw myself, in passing there yesterday, that the shubbery had been trimmed, and the flower-garden enlarged, and new walks cut, and the old fence round the yard is being torn down, and the foundation for a new one laid. And, besides," she went on, "Mrs. Brett, the house-keeper, you know, told our Annie that all the inside of the house was turned topsy-turvy with painters, and paper-hangers, and upholsterers, and that the doctor brought home a lot of new books last week, *poetry and stuff*, she said; and that as soon as he could leave some of his patients for a day, who were too sick to spare him now, he was going to the city to buy new furniture; for, Mrs. Brett said, she supposed there was nothing fine enough here in our little town, and, though the old was suitable for the first wife, it wouldn't do for the second; but it

wouldn't make much difference to her, as, when the new mistress came in at the front door, she should go out at the back, for she couldn't bear to see another in poor Mrs. Houghton's place, and she did not see how *he* could, but she s'posed it was all right."

I could not help smiling at Mrs. Brett's view of the subject, since every one knew that the dead wife was no favorite of hers in her lifetime; but verily Othello was not so different from the world in general when he said:

"I'll kill thee, and love thee afterward!"

Now that I was reminded of the circumstance by Josephine's news, I remembered that Dr. Houghton had talked to me one evening during my illness on the subject of furnishing—trying, as it seemed, to ascertain the tastes of the family, with a view to pleasing them in his new arrangements.

"Did Josephine select and dispose the furniture of this room of yours, Miss Hartley?" he asked of me one evening after taking a most careful survey of all the details of my apartment; "it is quite unlike the rest of Mrs. Rawson's arrangements."

"No," I said, "the furnishing of this room is all due to my taste, or want of taste; I hope you like it."

"It is harmonious," he replied, "and certainly looks as if you might have chosen it, that is to say, it expresses you—yes—I do like it."

This was all of our talk that I recalled, but I felt now as if I understood his drift.

The next evening after Josie had told me the great news, I was voted by everybody well enough to go down-stairs once more. The doctor had said, however, I must wait until he came in, and, if he thought it prudent for me to go, he would carefully convey me down himself, and see that I took no harm in the transfer.

However, when the evening came, I did not wait for his permission or aid. It took me some time, and tired me not a little, to make my toilet unassisted, now for the first time since my illness, but it was done at last, and, resting for a little while, I slowly descended just as tea was brought in, and took my old place at the table with a grateful, peaceful, almost happy heart. While we yet lingered—for it was pleasant to be there together once more, and we were in no haste to rise—we heard the bell and the well-known step for which I had listened daily for so long.

The doctor saluted us almost gayly, and I thought I had never seen him so genial and delightful. He seemed really glad to see me down-stairs, though he shook his head gravely, as he said: "Do you know, Miss Hartley, you are disobeying orders? You were to wait in your own room till I came to fetch you. But I am too much delighted to have you with us again, to put on the proper professional look of displeasure."

"But I made no promises, and therefore have not broken my word; recollect I was discharged cured yesterday."

"Nevertheless, I think I shall look after you from time to time, to prevent a relapse," he answered; "but you are losing the last glimpse of the sun in this shaded room. Miss Hartley, let me assist you!"

And the doctor put my arm through his, and waited for Mrs. Rawson and Josie to precede us to the parlor.

"Do not hurry yourself," he said kindly; "lean on me—I want you to take better care of yourself now, not only for your own sake, but because—"

"Take care, doctor! you came near missing the step," I said, breaking into his unfinished sentence; "either you are a bad guide, or I am not sufficiently accustomed to being led, to profit by your kindness."

My friend vouchsafed no reply to my remark, but led me carefully forward to a low, cushioned chair, which he placed so that I should be near the window and yet partly sheltered by the fall of the curtain, and, seating me, folded the shawl close about me, and then, taking a seat himself near Josephine, entered into general conversation with us all, which I was sorry to have interrupted, an hour later, by the arrival of Mr. Philip Singleton.

That gentleman having very properly congratulated me on my recovery, and the doctor upon his medical skill, proceeded to inform us that it had been a fine day—unusually fine—and added: "Especially for the ladies, you know; the streets begin to look really charming again; upon my word, the little bonnets and things passing a fellow's office are quite distracting, though I regret to say I missed some of the fairest of the sex to-day from the throng."

And his glance took in our group generally, to whom he considered himself as having done the agreeable in a most taking manner. We ladies bowed our acknowledgments, and the doctor rose to take his leave, Phil exclaiming, "Ah, doctor, how can you leave such society? Hope I am not sending you away?"

"By no means, Mr. Singleton," he returned, "I am only obeying the voice of that ugly imp Duty, whose orders I have already disobeyed too long."

Slowly but surely now, as the days grew long and warm, my health and strength returned to me, and, as they came back, came the desire for some change, some employment. I wanted to take a house, so that I might have an interest in something in the wide world that was exclusively mine. This step the Rawsons were decidedly opposed to, and even Dr. Houghton, when appealed to by them on the subject, said I had better have all the summer to recuperate, and if at the end of that time nothing happened to change my plans, and I still desired to do so, he saw no reason why I should not; but, as a physician and a friend, he should advise me not to take such a step for two or three months. So, against my own wishes, I yielded for the present.

But, by the time the summer was really upon us—it was an unusually hot one, following a wet spring—I grew very restless, and the air of the place seemed stifling to me. A neighbor of ours was going to the White Mountains with his family, and asked me to accompany them, and, though he gave me little time for preparation, I was too eager for a change to refuse his offer.

So busy was the doctor, for it was a sickly season, that now we scarcely saw him for days together; and, when we did, he seemed hurried and anxious, and my plans were made and almost ready to be carried out before he knew of my intention to leave Hampstead for the summer.

It was within a day or two of that fixed for my departure when he came in early, one evening—a thing he rarely did now—to share with us, as he said, something that was too good to be devoured in solitude, and, exhibiting a dainty little volume, he proceeded at our desire to read the last new poem.

"Oh, doctor!" exclaimed Mrs. Rawson, who was mending an apron, and who, by-the-way, was rather practical than poetical in her tastes and employments, "excuse me for interrupting you, but who do you think is going away, to stay all summer?"

Almost always self-possessed, I saw that the doctor was for a moment surprised and thrown off his guard by the abrupt question, but there was no change in his tone as he said:

"Can it be possible that Mrs. Rawson is about to do any thing erratic and unusual?"

"No, indeed, I could not be spared from home. It is only Aunt Jenny who is so fortunate as to have no cares and no ties to keep her. She is going to the mountains with some friends for a while. Don't you think it a good thing for her?"

"I think it will be an admirable thing for her health," he replied; and, turning to me, "Why do you not take Miss Rawson with you, so that one of you could take care of the other?"

"Josephine does not care to go," I said; "and as for me, I shall be with friends, and, besides, I have had a good deal of experience in taking care of myself."

"But how soon do you propose to go? I shall see you again, shall I not?"

"If you come to-morrow evening. The day after that I shall most probably leave."

"Then I shall most certainly come, to say good-by," he replied.

"Do so, but pray resume your reading; the story interests me."

So the reading was resumed and finished almost without pause or comment, the doctor only stopping once for a moment to bow to Mr. Singleton, who had meantime joined our group. Then he rose to go, saying, as he took my hand, in a tone designed only for my ear: "I shall see you again to-morrow evening. I must see you before you leave, for I have much to say to you that you ought to hear. I wish I had known sooner, or that you were not going so soon; but no matter—pleasant dreams, and good-night."

I had not told Dr. Houghton the exact truth. It was not only possible, but highly probable, that I should start the very next day, although the following one was that originally fixed for our departure. But my friends were very anxious to get off, and, if they could so arrange, we should go in the morning, though even my sister-in-law had not been told of the change of plans.

That Dr. Houghton proposed to take to himself a wife again, no one now doubted; indeed, some of those who had charged him with such intent, said he did not deny it.

And so when a note was handed me at the breakfast-table next morning, informing me that my friends would expect me to be ready in a few hours, I was glad to escape, and leaving my adieu for the doctor, and my regrets at not seeing him again, I bade good-by to my friends for a season.

I heard often from home. Josephine, being an indefatigable letter-writer, informed me of all that occurred in her little world, which was seldom any thing of sufficient interest to bear repeating. The great news I expected did not come, and, strange to say, I did not ask her for it. Once she had to tell me of charming rides taken on horseback with Phil for an escort, and that they did not see very much of the doctor now; it was still sickly in Hampstead, and what, with his practice and repairing, he did not seem to rest day nor night. She wrote me, she was sure he was very much disappointed at not seeing me again; that he had asked for my address, saying that I might need medical advice while away.

From Dr. Houghton himself, after I had been gone about a fortnight, I received a long and most friendly letter. He made particular inquiries about my health and occupations, and the probable length of my stay. Nothing could have been kinder or more considerate, nay it was almost lover-like in its tone, and that tone, absurd as it may seem, was the very thing that roused in me something very nearly akin to resentment.

Of course, I would not make myself ridiculous by allowing him to get any intimation of my feelings. I waited a very reasonable length of time before replying, if reply my letter to him might be called.

After thanking him for the kind interest he had manifested in reference to my health, which I assured him was perfectly restored, and telling him how busy I was, and how thoroughly I was enjoying my summer recreation, I proceeded, in an entirely impersonal manner, to edify him with a very proper magazine article in reference to the walks, drives, and views in my present locality, and upon mountain-scenery in general. This closed the correspondence, with the exception of a formal note received from him some time afterward, in which he acknowledged the receipt of my very interesting letter, and regretted that the hurry of business prevented him from making a longer and more suitable reply.

About a week before the time fixed for our return, I had a letter from Josephine, evidently written under great excitement. It puzzled me exceedingly, not so much by what it contained as by what it withheld. She said she had a great secret she wanted to tell me, and wished to know when I would return; if not soon, she would write it, though she feared to trust to the mail.

"I want your advice, aunty," she said, "though it is too late now, as I have made up my mind."

When the time for my return drew near, I had matured my plans in reference to my future way of life. I resolved to take a house of my own, and make for myself such a home and such a household as a single woman might; and, whatever that should be, I knew it would at least be something more to my taste than the occupying of a subordinate position in the home of another.

It was little more than a year now since I had come first to Hampstead, and in that time I had learned more of myself, and lived more, than in all the other years of my life. I had suffered, but I had gained strength thereby; for I knew that, though all the undercurrent of life was changed for me, the surface was, to all human observation, unruffled and undisturbed.

With a very cheerful and happy heart in my bosom, did I shake the dust of the cars from my feet and garments, at high noon, on one of the last days of summer; and, hurrying along the few blocks that lay between the depot and my home, surprise my friends, from whom I received a warm welcome and many congratulations on my improved appearance.

"And now," I said, when our greetings were over, "as soon as I have taken a bath, I shall be glad to give you a specimen of my improved mountain appetite."

"You can only have about an hour," said Mrs. Rawson, "or my dinner will be spoiled—so don't bother Aunt Jenny; Josie, you act like a baby;" for the girl was hanging about my neck and almost crying, as in a sort of nervous delight.

"Do let me go and help you, aunty," she said, as I turned to seek

my room; "I can't bear to have you out of my sight; you have been away so long."

"Thank you, dear," I replied, "but I can get on much faster alone; and you will see enough of me now; but, if you really want to do something, please go to the door and show the porter, whom I see there, where to carry my trunk, and then unstrap it for me, and I shall be ready for dinner all in due time."

We lingered a good while over the dessert that first day of my coming home, though now, that there was opportunity, Josie had very little to say.

"And now," said Mrs. Rawson, when at last we rose from the table, "you must go and take a nap, so as to be wide awake this evening, for your judgment is to be asked in a most serious and important matter. We are all to be taken to inspect Dr. Houghton's improvements. He concluded them some days ago, but I think he has been waiting for your return; for, when I told him we expected you to-day, he gave the invitation. I begin to be half-jealous lest he should prefer his aunt to his mother-in-law;" and she laughed heartily at the odd suggestion.

But Josie, who seemed really distressed by the remark, said, almost crying:

"O mamma, how can you talk so! Don't; it makes me feel miserable."

"Why, darling, what is the matter with you? You are not well, surely; you will need the doctor in good earnest, I fear. What is it, my child?"

"Nothing, nothing at all, mother, only I'm silly and can't help it; but it's over now, so don't say any thing to the doctor, nor any one else, please."

And, true to her word, Josephine was chatting and laughing the next moment, although to me the merriment seemed more unnatural than the crying. However, I soon forgot all about it; for, once more in my own quiet room, I was not long in passing into the realm of dreams, and very delightful and very refreshing was my stay there.

How peaceful and pleasant it seemed that evening to be taking tea under the vines of the porch again; and how perfectly natural sounded the quick ring of the door-bell and the fall of the old familiar footstep; and how glad I was to see the kind face of my friend, though it did look a little worn and pale, smiling down upon me once again!

Of course, he was not surprised, though I was sure from his manner he was pleased to see me there; and, for myself, I was as composed as in the presence of my most ordinary acquaintance.

Only Josie seemed constrained and uncomfortable, a feeling which she ardently tried to hide by talking a great deal.

As Dr. Houghton had come to fetch us to inspect his premises, he declined to be seated, saying:

"I want you to have the full benefit of the daylight for your observations, and, though I feel sorry to break up your pleasant group, I cannot deny myself the pleasure I hoped to have this evening of gracing my hermitage with the presence of ladies."

So we rose, and in a few moments were ready to set out.

Dr. Houghton's house had been built by one of our old and wealthy families, whose declining fortunes had obliged them to part with it, and, when taken by its present owner, had been greatly out of repair. Now, however, as we came upon it, we found it changed so as to be hardly recognizable. A Mansard-roof had been added, new porches built at the sides and in the rear, and within old partitions were taken down and new ones put up. A dining-room had been built to open upon the flower-garden, and the basement-room, formerly used for that purpose, was converted into a laundry; in short, it was a new place altogether.

Every thing did we examine and approve. Mrs. Brett was even called upon to exhibit the china-closet and kitchen-pantries. Only one room, on the second floor—though I judged from its situation it must be one of the very pleasantest in all the house—was not thrown open to our inspection, although we passed and repassed the door several times. At last—though, of course, we had said nothing—our host seemed to think it necessary to make some sort of apology, and, trying the door, remarked:

"Ah, this is locked; I thought so. I believe Mrs. Brett has something she particularly prizes in here, and she probably has the key."

The housekeeper, who happened to be near enough to hear her name, came forward at this moment, and asked what was wanted.

"I was only speaking about the key of this room," the doctor said, leading the way to another part of the house. "I must have mislaid it; but no matter, it is not quite finished."

"I thought you always carried that key yourself," persisted Mrs. Brett; "but, if you have not got it, then it must be in the office with the others. I will tell James to look for it, and bring it to you;" and she moved away.

The doctor called after her:

"Do not give yourself the trouble, Mrs. Brett. James is busy just now with work. I do not wish him to leave, and, besides, I am not at all certain he could find the key."

At last every thing that was to be seen had been seen and admired, discussed and commented upon, and it was time for us to take leave.

Dr. Houghton proposed to go with us, saying, as we were starting, he hoped no one would think of any thing so inopportune as requiring his services for a few hours; but, as we passed the office-door, the "Inevitable" stood in wait for him.

"Well, what is it, James?" he said, seeing that the boy wished to address him.

"A gentleman is waiting in the office for you, sir."

"Very well. Tell him I will be with him in a few moments."

So the doctor, after escorting us to our own door, was obliged to leave, and we saw no more of him that evening; nor did we see any one else.

I inquired after Mr. Singleton.

He came very often, Mrs. Rawson said; she wondered he was not there now, though no doubt he would appear before the evening was over.

But he did not come; so she and I had a quiet talk together, for Josie kept outside, walking up and down in the moonlight. When she came in she complained of being very tired and sleepy, and said she wished we would come to bed.

"But suppose we are not ready," said her mother; "you can go to sleep without help, can't you?"

"Of course, I can; but, if I do, your coming up-stairs will wake me, and then I can't get to sleep all night."

"Josephine, is that a proper way to speak to your mother?" began Mrs. Rawson, severely; but Josephine had already thrown her arms round her neck, saying:

"Don't, mother; don't scold me to-night; I can't bear it. Forgive me for speaking so. I did not mean to. I'll go to bed now. Good-night." And, kissing us both affectionately, she went.

"I know she can't be well," her mother said, apologetically, to me after she was gone, "or she never would act so. I am almost sorry I spoke so crossly to her, and, if she is not better in the morning, I shall send for the doctor without consulting her. Perhaps we had better go up-stairs now, so as not to disturb her."

Owing to my afternoon's nap, I was not at all sleepy; and was sitting at my window about half an hour after I had gone to my room, when Josie, still dressed, knocked softly, and came in.

"What, not abed yet!" I exclaimed. "Do you want any thing?"

"No, only to say good-night."

"But you said that below," I answered. "Josephine, you have something to tell me."

"It is too late now."

I thought she referred to the hour, so I said:

"No, it is not late; but, if you prefer, wait till to-morrow; you will tell me then, won't you?"

"Yes, dear aunt, you shall know all to-morrow." And, kissing me again, she stole from the room, though even after I was in bed, an hour later, I heard her step across the passage, although she walked very lightly, as if not wishing to disturb the household.

It was pretty late when I rose next morning, for Mrs. Rawson, thinking I was tired, and Josie not well, had the breakfast put back half an hour. When I did come down, however, and we two had taken our places, the mother said, anxiously:

"I do wonder what keeps Josie! Have you seen her?"

On my replying in the negative, she told Kate, who was just bringing in the coffee, to answer the door-bell, which was rung energetically at that moment, and then go up-stairs and tell Miss Josephine that breakfast was ready.

Kate went to the door, and came back presently, handing her mistress a letter, saying:

"It was a boy with this, ma'am. No answer."

Mrs. Rawson examined the outside carefully, and then breaking the seal, and handing it to me, said:

"Here, Jenny, I have left my glasses up-stairs; see what this is. I do not suppose it contains any secret."

I opened it, saw the contents at a glance, and laid it down without saying a word.

"What is the matter; why don't you read it?"

Mrs. Rawson spoke a little impatiently.

"I can't—that is, I do not like to," I said. "It is from Josie—don't be frightened. She is married."

What followed my rather abrupt announcement I do not well recollect. It took the mother some time to really accept the fact that her daughter had been guilty of such needless folly and deception; but when, at last, she did grow calm enough to listen, I proceeded to read the letter, which ran as follows:

"MIDNIGHT.

"DEAR, DEAR MOTHER: Forgive me for what I have done. I would not have taken this step but I feared you would force me to marry one to whom I could not give my heart, and I never could have loved Dr. Houghton as I love dear Phil, who is now my husband. We were married two hours ago, Phil having arranged every thing yesterday. We thought it would be so romantic to do this way. We shall start at six in the morning for the sea-side. I am not sorry for the step I have taken, though I am sorry to pain you; for Phil is just as kind and good as he was before. He has not changed a bit. But, dear, dear mother, I cannot be perfectly happy till you say that you forgive me. Write and tell me that you do. Phil sends his love to his mother, and says he asks pardon for robbing her of her treasure. Give love to Aunt Jenny, and say to her I wanted to tell her last night, but my courage failed. Do write, and do forgive us.

"Your loving daughter,

"J. R. SINGLETON.

"P. S. Dear Mother: Phil was not as much to blame as I!"

Thus the letter ended, and thus ended Mrs. Rawson's plans and hopes for her daughter's settlement.

Gradually subsiding from her first feeling of surprise, sorrow, and indignation, at the foolish and unnecessary deceit the fugitives had practised upon her, the mother spent the rest of the day in blaming everybody but her daughter, and in writing and rewriting letters to her, which she could hardly make kind and forgiving enough; for, though she was ambitious, she was a loving mother, and Josie was the very apple of her eye.

I was sitting, as the shadows fell, patiently beside her, letting her talk to her heart's content, when Annie came up to my room, and announced "Dr. Houghton to see Miss Hartley."

"I am glad he asked for you," said the distressed mother, "for I shouldn't know how to see his face. I wonder if he knows? But, whether he does or not, you can talk with him best, Jenny; you won't mind it. Oh, dear, dear!"

I found the doctor awaiting me in the parlor. His manner was certainly a little different from what it had ever been before, though he seemed neither excited nor distressed. There was some change in him, which I rather felt than really defined.

He shook hands very cordially, led me to a seat, and, taking one near me, inquired after my health.

I attempted some sort of reply, confusedly I believe, for I was trying in vain to read his expression, and only growing more puzzled, and said, abruptly:

"Surely you have heard—you know—"

"About Josephine? Yes. The whole town knew it, I imagine, by breakfast-time this morning. Mrs. Brett poured out the news with my coffee, and seemed rather disappointed, I thought, that I swallowed both so calmly. That they should marry," he continued, "was well enough; at least it does not surprise me; but, what puzzles me, is the running away. I think that must have been Singleton's idea. You know Mrs. Rawson was not inexorable—was she?"

"She was not consulted, of course; though, if she had been, she would, I am sure, have made no serious objection to the match; but," I proceeded, hardly knowing what I did say, and breaking down in the middle of my sentence, "I thought—I feared that you—"

"You thought I might have something to say on the subject," the doctor hastened to reply. "As a good friend of hers, I might have

wished her to marry a person a little more to my mind. Singleton is not a bad fellow; he has no vices, and no very bad faults. He is weak, but that is the worst that can be said of him—though I have no right to say any thing on the subject. I am not the lady's guardian, and certainly never aspired to be a lover; did you imagine that I did?"

"I hardly know; I thought you cared for her."

"So I did, and do; but not in that way, and I am very glad that Josephine comprehended me better than you seem to have done. May I ask, Miss Hartley, if the lady in question is such a one as you would have selected to be my wife?" And the doctor looked at me in a way I could not understand.

"I should never have presumed to take so important an office upon myself, more especially as I consider you fully competent to the task of making such selection without assistance."

I did not look up, but I felt the eyes that were bent upon me as he said, slowly:

"That is as it may be. My competence for the task remains to be proved; but my selection is made, and now you must tell if it is wise."

"Describe her. Do I know her?" I said.

My mind was in such chaotic confusion now that I dared not trust my voice with more words.

Earnestly, almost solemnly, he made reply:

"You do know her, Jenny, or you ought to. Sometimes I think I do, and then again she withdraws herself so far from me, and is so inaccessible and self-contained, that I doubt and fear. Listen: she is not young, though she is younger than I; much younger, I think, in heart and feeling. She is not perhaps what others would call beautiful. She is the light of my eyes. I know she has a fine womanly nature, and a heart capable of the tenderest and truest devotion, for I have studied her long and well. I have made, I think, a good and a pleasant home for her, and have given her a heart that, whether she believes it worth her acceptance or not, is at least wholly hers. Do you think she will take it, Jenny?"

It was growing dark now, and I was growing braver, since my face was veiled in shadow, and I spoke steadily:

"You must ask her; how can I answer for another?"

He did not speak for a moment. Then he drew nearer, looked with eager, questioning eyes into mine, and, reaching out his hand to me, said only "Jenny, Jenny!" And then I put my hand in his, and for a moment he held it silently, yet firmly and tenderly, and, bending over, almost reverently, he touched it with his lips and said: "Darling, I will never hold it carelessly, and never, never let it go."

Mrs. Rawson did not seem so much astonished by the doctor's proposal as I supposed she would be.

She said "she did not know what was strange any more, or as any thing was! It seemed queer that anybody should want to marry an old maid; not that you are any older than he is," she added, as if that were admitting a good deal; "but then a woman seems so much older than a man."

The next evening I did not see Dr. Houghton; but the evening following that he spent with me, and, when he held my hand at parting, he said:

"Do you know, Jenny, what day this is, and what a month will bring round?"

"I am not likely to forget what you are so ungallant as to remind me of: namely, that on this day one month I shall be thirty-seven years old."

He did not seem to heed the jesting tone in which I had spoken, but answered gravely and tenderly:

"That is the day, Jenny, on which I wish to take you home. I am, as you know, much hurried with business now, and I want you near me, so that we may begin our courtship in good earnest. You will not deny my first request, will you, darling?"

And so it was settled. Phil and Josie would be back soon, and I longed to get away from the confusion incident to the changed order of things, and to enjoy my new-found happiness, and besides I knew I was waited for with tender impatience.

We had a quiet wedding, or rather marriage; no cards and no wedding-tour; and then we two went home. And once again we went over the house together (oh, how much more pleasant and beautiful it appeared now that it was mine!) and came at last to the door of the room that had not been thrown open to us on my first visit.

"I have found the key to this Bluebeard's chamber," said my guide, taking the article in question from his pocket. "Do you fear to behold its mysteries?" And he put the key in the lock, and waited for my answer.

"Not with Bluebeard beside me," I said. "Enter."

If he who had been so thoughtful for me could have seen in my face only one-half the joy that was in my heart when my feet passed the threshold, he was surely repaid.

I was at home in my own room again. For here I saw reproduced the same effect of color and contrast, the French gray paper, the carpet of green and white, with crimson flowers dropped here and there over its ground of soft emerald moss; the curtains of pale green bordered with crimson, and even the pretty chintz covers of the seats—in short, every thing I had left was found again, even to my favorite volumes and engravings, and the pot of mignonette, such as always had place in my window.

I do not know what I said, and I shall not say if I did, lest it might sound foolish if written; but after a little while we were sitting side by side, quiet for very happiness, in the deepening twilight, knowing such sweetness and fullness of perfect content as rarely comes in this world save to the most favored of the children of men.

Mrs. Rawson invited her son-in-law to come and live in the house with her, and this he consented to do, the more willingly, I imagine, as he had no home of his own to go to.

"For," he said, "you know Josie has her duties as a daughter as well as wife; and, if her mother wishes it, I think we ought to give up our comfort for hers. It isn't exactly what a fellow would like, having his mother-in-law in his house, you know. But a woman's in a bad fix without any man to take care of her."

And Mr. Philip Singleton yielded to his fate in a philosophic manner most edifying to behold.

Josephine, I think, was a little disappointed at first that her elopement was so entirely unnecessary, and at the quiet way in which matters finally adjusted themselves.

As to Phil, I am sure he cannot quite comprehend that Dr. Houghton's choice of a wife was not, after all, a *dernier ressort*. He often bewilders his brain over the subject, and concludes by saying:

"Upon my word, Jo, I can't understand the doctor; and, do you know, the fellow keeps it up well, if he isn't in earnest. It staggers me to see him just as polite and attentive to his wife as if she were a pretty young girl, and he was courting her. It's queer, and not natural, for a man, you know; but he always was a queer fellow!"

It is just three years to-night since I first entered this room, a sacred place to me; and now I am sitting here in the twilight, waiting, as I have done so many, many happy times, for the footsteps whose fall always makes my heart beat quicker when it comes.

Two darling children have gladdened our home.

One I have just kissed, asleep, in his cradle; and the other, after lying in my arms for a brief, happy season, was called to Him who loves to bless little children; and, though I grieved to part with her, in my heart I could not forbid it.

Very sweet and very dear they are to me. On one I hope to lean as I descend the shadowy slope that borders the silent river; and the other I know will wait to lead me softly up the shining hills that lie beyond; but not both my babes, dear as they are to me, not all that is mine besides, nor all that I hope for, is so precious to my soul as the devotion of my faithful and passionate lover, my true and tender friend.

PHOEBE CARY.

A BALLOON-VOYAGE WITH GAMBETTA.

IN August, 1870, Mr. W. W. Reynolds, the agent of a New-York firm, went to Paris to make contracts for arms with the French Government. His business detained him there until Paris was invested by the German army, and the usual modes of departure suspended. He availed himself of this forced delay to go about the city, and had excellent opportunities for observing the preparations for defence. It was a good while before the Parisians began to feel the effects of the siege. Most kinds of food were plentiful at first, including meat and vegetables, and the only articles lacking were butter and milk. All the public buildings were occupied for military or state purposes. The

Louvre was turned into a gun-factory and government store-house, the Tuileries was a hospital and barrack, the Luxembourg Garden was used as a sheepfold, while the Jardin des Plantes was filled with oxen, the Grand Opera House was stored with provisions, and the Champs Elysées had the appearance of a military camp. The Boulevards were used as a parade-ground, and, on one occasion, Mr. Reynolds saw General Trochu review the whole army within the city, numbering over a quarter of a million men. After waiting about ten days longer, finding there was no other means of escape, it was decided that a balloon should be resorted to. Up to this time only a few of these machines had been made use of, but they were being constructed as fast as possible. A special permit had to be obtained from M. Peard, the Finance Minister, before the order could be given to Nader to make a balloon, which cost twelve hundred and fifty dollars in gold, and occupied ten days in the making. Nader's manufactory was in an old theatre, where about fifty hands were employed. Instead of silk, which is the customary material, strips of varnished linen were used. They were cut out by men, sewed together on sewing-machines by girls, and then filled with ordinary gas, taken from the street-lamps. They were found to be quite sufficient for a few hours' flight, and could probably have been supplied by the score, if needed. Mr. Reynolds's balloon had a capacity of twelve thousand cubic feet, and was yellow in color. It was all ready for service, when word was received from M. Gambetta, the Minister of War, that the interests of the republic required that he should leave Paris at once, and he therefore requested the use of the balloon. He promised, however, that the next one that was completed should be given to Mr. Reynolds in its place. This request could not, in courtesy, be refused; but, as it happened, the weather prevented M. Gambetta from leaving before the second balloon was ready, so that the two started together.

Friday morning was the time agreed upon to leave, and an immense concourse of people assembled to witness their departure. The event had been advertised in the journals, and all Paris was interested in it. It was well known why Gambetta was going to leave the city, but there was some mystery about the cause of the departure of the two Americans, Mr. Reynolds and his friend, and consequently some excitement was shown by the populace. All the members of the government were present to bid adieu to Gambetta, so that the occasion had something of an official character. Both balloons bore the tricolor, and were greeted with cries of "*Vive la république!*" and waving of handkerchiefs, as they rose into the air.

In Mr. Reynolds' parachute there were, besides himself, his friend and companion, Mr. C. W. May, a New-York merchant, M. Cuzon, a French army officer, who bore official dispatches, and their engineer, Durevilio, who managed the balloon. M. Gambetta was accompanied by his private secretary and engineer. Each party was seated in a wicker-basket attached by eight cords to the body of the balloon. They carried only a few extra clothes, some food, and other necessities, together with a coop of carrier-pigeons, and copies of two addresses, one in German from Victor Hugo, and another in French from Jules Favre, for distribution through the country.

At eight minutes past eleven the start was made. The day was clear, and not a cloud obscured the sky. The balloons rose rapidly to a height of eight hundred yards, and were carried by the wind, which was northeast, directly toward the Prussian lines. Paris lay beneath them, spread out like a panorama, so that the public buildings and streets could easily be distinguished.

The Prussians, as soon as the balloons approached them, opened fire from several points with cannon, musketry, and rockets, and for some minutes their missiles whistled through the air in dangerous proximity. The mounted uhlans also tracked the balloons for some distance along the roads, in expectation that they would have to descend, but they were doomed to disappointment. Gambetta, however, narrowly escaped falling into their hands, and also of destroying his companions. From some cause his engineer lost control of his balloon, and it dropped down until it was close to the ground. It then soared up at a rapid pace, but, to the horror of Mr. Reynolds's party, it rose directly under their balloon, and for a few minutes it seemed as if there must be a fatal collision. The party awaited the result in fear and trembling, but the wind fortunately put an end to their danger by wafting the lower balloon to one side, and the two then passed on in safety together, rising to the height of more than a mile. At this distance the landscape seemed to blend in a confused mass of objects. The roads appeared like white lines, villages seemed to be mere hamlets, while the woods, which had just

taken on their autumnal tints, looked like a raised, velvet carpet. Even with strong glasses, they could scarcely tell whether the people they saw were peasants or soldiers, and it took several minutes for the rolled-up papers and circulars which they threw out to reach the ground. The speed of the balloons could not be estimated while they were high in air; but, when they descended near to the ground, it was seen that they were going as fast as a railroad-train. Though the engineers had not had much experience, they succeeded very well in managing the machines. Every little while they would descend near enough to drop written questions to the peasants, asking where they were, and the latter would shout up the name of the place.

At two o'clock they all dined. Soon after, the balloons parted company. The one which bore Gambetta tried to land at Criel, but found, when close to the ground, that it was over a Prussian camp, and its occupants only escaped capture by throwing over their baggage, carrier pigeons, and some of their clothes, and even then did not escape until after M. Gambetta had been wounded in the hand. His party afterward succeeded in landing in a tree near Amiens, whence they were rescued by passers-by; but their balloon was torn to pieces.

The other party fared better, and at four o'clock safely landed by means of a grappling-rope, after being up just five hours. The place was the Ville Roye, in the Department of the Somme, ninety-five miles from Paris. The people of the neighborhood hoisted the French colors, to show that they were friends, and were overjoyed to see the party, who brought twelve days' later news from the besieged capital. Their pleasure was increased on learning that two of the party were Americans. They were escorted to the mayor's office, and every one seemed eager to have the honor of entertaining them. A public reception was given in their honor that evening at the prefecture, and the next day they were forwarded, free of charge, by rail to Amiens, where they found Gambetta, and accompanied him to Tours. At different stations along the route they received a popular ovation. The people were everywhere overjoyed to see Gambetta, who spoke to them from the train, and was received with great enthusiasm. In personal appearance Gambetta is short and stout; he is about thirty-two years of age, though he looks much older. He is a fiery and eloquent speaker, intense and earnest in manner, and apparently strongly patriotic. The two Americans, while with him, were much impressed by his energy and spirit, and give him the credit of every thing that has been done outside Paris to rouse the French people. He found them apathetic and almost demoralized, and, by his ardor and eloquence, infused a new spirit into them. But for his exertions, nothing would probably have been done by the people in the provinces, to resist the Prussian invaders.

The Americans made a present of their balloon to the French, and received the following letter of thanks from Gambetta:

"TOURS, 12 octobre 1870.

"MONSIEUR REYNOLDS: Votre offre généreuse me touche sans me surprendre, et je vous en remercie au nom de la république et de tous mes collègues.

"Bien cordialement à vous dans la république.

"Signé: L. GAMBETTA."

At Tours the two Americans had an interview with General Garibaldi, who was suffering from sickness, and received them, wrapped in blankets, seated in a chair. He wore a red shirt, and round hat without a peak, and looked very much as the late pictures represent him. He spoke with great pleasure of his life in this country, and with pride declared himself to be still an American citizen. He said he was proud of the balloonists for having taken such risks to pass the Prussian lines, and gave his autograph with the words "*Au courageux aéronaute*" to Mr. Reynolds. He spoke with confidence of the success of the republic, and said if he had one hundred thousand men he could drive the Prussians from France. He was unfortunately nearly disabled by rheumatism; but, if he could not ride a horse, he was able to go in a carriage, and all his strength should be used for the spread of universal liberty. He spoke English, and could be understood readily. Altogether, the old man looked and talked like a hero, and made a strong impression upon the two Americans, who were sorry not to see more of him, as he left by train, the next day, to join the army.

Mr. Reynolds remained in France for two months longer, attending to the shipment of the arms for the French Government. He

is now in this city, and has communicated to us these particulars of his voyage in the air with Gambetta.

C. F. WINGATE.

THE TURCOS.

BY HENRY, BARON VON MALTZAN.

THE word "Turco," now so frequently used, is by no means the proper appellation of the native Algerine soldiers. Officially, they are called *Tirailleurs Algériens*—that is, "Algerine Skirmishers"—and this is the only name given them by the Arabs, as difficult as it is for them to pronounce these French words, and the one which the troops apply to themselves.

To be sure, *tirailleur* comes very much distorted from the mouth of an Arab, so as to be scarcely understood, and sounds something like "derallyir." But to the Arab it seems absurd to use the word Turco, as he knows there is not a single Turk now in this corps, and perhaps none has ever served in it. The reason for their not calling themselves Turcos lies in the fact that the whole word, by its termination, indicates a nickname of contemptuous signification.

The Turcos are a so-called foreign corps; for, although the Algerines are French subjects, they have not the rights of French citizenship. The name of Frenchman, in its political sense, is denied them. As a foreign corps, the Turco troops are on equal footing with the Foreign Legion, and foreigners of all nations are allowed to enlist in it. I once met two Turcos in Algiers whose white skin and blond hair plainly betrayed their non-African origin, and I was not a little surprised to hear them converse fluently in Low-Dutch. They were from Brunswick, and had first wished to enter the Foreign Legion; but, as this was filled, they were obliged to join the Turcos, and are now called Mustapha and Hassan. Every European who becomes a Turco or Spahi (native trooper) must assume an Arabian name. The difference in the formation of these two foreign divisions appears to be that natives are received only in the Turco regiments, while in every other respect this corps can be recruited from the same elements as the Foreign Legion. The conditions of advancement are the same in both. All the officers, from captain up, are exclusively Frenchmen; and no foreigner can attain a higher rank than that of first lieutenant. Formerly it happened a few times that an Arab was made a captain for distinguished services; but this was for him a purely nominal rank, as he was under the control of a French lieutenant, and had nothing to say. Such instances as Jussuf, who became a general, are exceedingly rare.

The elements composing the Turcos are extremely various, since, as I have said, even Germans have served among them. Yet, one can distinguish a predominating element—the natives of Great Kabyle and the province of Constantine. The Kabyles, or Berbers, are aborigines, who speak their own language. Their type of countenance varies materially from that of the Arabian. The Arab has rather long features, a straight or aquiline nose, and somewhat resembles the Jew. The Kabyle, on the contrary, has a roundish face, sometimes prominent cheek-bones, often a flat nose, and generally a large mouth. There is a great diversity of complexion among them, some having white skin and light hair. These belong to that race which are generally regarded as descendants of the ancient Vandals, although for no other reason than their physiognomy, already mentioned. I saw others who were quite dark-brown, but who had no negro blood in their veins, as the Kabyles despise the blacks and will never marry a negress.

The great variation in the external appearance of the Kabyles has been produced by mixing with other tribes. Among the mixed races are two whose members enlist in the Turco regiments—viz., the mulattoes and Kuluglis. The latter are a mixture of Turks and Arabs, descendants of the janizaries, who formerly ruled in Algiers, and Arabian women. The word signifies "Son of the One-eyed," as the first Turk that married an Algerine woman had but one eye. The Kuluglis have inherited the warlike instincts of their ancestors, and therefore willingly become soldiers; but, as they have also inherited their pride, which receives little nourishment in the low positions that the Turcos are obliged to occupy, only the most degraded among them enlist in these troops. Nevertheless, there is always a number of Kuluglis with the Turcos, and the French consider them more capable of discipline than the rest. They differ little from the inhabitants of Southern

Europe, resembling them particularly in the luxuriant growth of their beards, while the beard of the Arab is very scanty.

The mulattoes are a most unwelcome addition to the Turcos, whom the French accept when necessary, but not willingly. The Algerine mulattoes are generally weak, in body as well as mind, and very difficult to govern—not so much on account of their licentiousness as their proverbial stupidity. The darkest element of all—the genuine negro—appears less often than formerly among the Turcos, since those negroes who went to Algiers as slaves are too old to serve, and no slaves have been imported there since 1848. Of the negroes born in Algiers, called the Schuschân, the same may be said as of the mulattoes, but in a still greater degree. They are generally too weak for service; yet there are a few exceptions, and a Schuschân is found, here and there, in the Turco regiments. From time to time, a free negro, still young, being too indolent to work, enlists; for the life of the Turco, when at peace, has a great attraction for such born idlers.

Formerly, the Turcos were treated much better than they are at present. They were a permanent corps, upon liberal pay and allowance for board, each man receiving one franc daily. The allowance for board has been withdrawn, and they are now given the ordinary soldiers' rations. Yet, most of them lead a better life with the army than they are accustomed to at home, especially the Kabyles, who in their own country live so frugally that the famous Spartan soup would be a rich dish compared with their food.

In ordinary life, a Kabyle eats nothing except his sour, oily barley-dough, which he calls bread, and washes it down with unrefined olive-oil. He eats meat only at great feasts, when he is treated to it by the chief of his tribe, as he is too avaricious to kill an animal himself.

If he is supplied with bread and oil, he willingly abstains from other food, observing very strictly the Mohammedan rules for eating. But this is not abstinence for him, as he is accustomed to nothing better at home. In other respects, he is a bad Moslem. Pork is to him the horror of horrors, and I can easily believe the story of a Turco's having thrown some sausage in the face of a citizen of Frankfurt, who in his kindness and ignorance of Moslem rules offered it to him.

The Kabyles are equally strict in respect to drinking wine. If one sees a drunken Turco, it is safe to conclude that he is not a Kabyle, but in all probability a Kulugli; for these descendants of the Turks pay little regard to the commandment relating to wine. Negroes and mulattoes are also fond of drinking. Genuine Arabs seldom associate with the Turcos; but their customs in camp-life and upon the march have much in common with those of the Kuluglis.

On the whole, it may be said that the Turco troops are recruited from the lowest and most immoral portion of the inhabitants. A city Arab or a wealthy land-owner would sooner think of hanging himself than of permitting his son to become a Turco. Among the Arabs they are universally despised, notwithstanding their acknowledged bravery. This undeniable valor does not elevate them in the eyes of the world. As it serves an unbelieving master, their own countrymen regard it rather as an evil; for to the modern Moslem courage is honorable only when it is exhibited in the service of Islam. The French are not so willing to recognize bravery in others as in their own countrymen. I have heard Frenchmen say that the courage of the Turcos was only the savage fury of wild beasts. Thus they thank the poor creatures who shed their blood for France in a cause foreign, and, indeed, hostile, to themselves! It is true, Napoleon presented the Turcos with medals, and a few even with the cross of the Legion of Honor; but the French in Algiers are accustomed to regard the cross of honor worn by an Arab in quite a different light from that which glistens on the coat of a Frenchman. I was once in a company, when a great Arabian chief, upon whom the government had bestowed the commander's cross of the Legion of Honor, entered; but he was treated quite shamefully. Surprised at this, I turned for an explanation to an officer of high rank, who replied, in a manner characteristic of the French bureaucrat:

"He is only a dirty Arab, and the Legion of Honor becomes him about as well as a golden collar would become a hog."

In view of the universal contempt in which the Turcos are held, nothing could be more ludicrous than the announcement, recently contained in the newspapers, that the French Government contemplated giving to the Emir Abd-el-Kader the chief command of the Turcos. If they had wished to render the emir ridiculous, and at the

same time contemptible, in the eyes of his countrymen, they could have chosen no better course. Moreover, the chief command would have been merely nominal, and Abd-el-Kader would in reality have been under the control of a French colonel.

The Turcos have not only excited contempt, but also the deepest aversion and disgust in all of the various campaigns in which they have opposed European enemies, as well as in the present war. The indignation of the German newspapers over the cruelties of the Turcos is certainly justifiable; but who is to blame for their being allowed to practise their cruelty on German soldiers? No one except the Government of France—"the most civilized nation on the earth!"

That the Kabyles are naturally cruel; that they torture their prisoners to death; that their women vie with each other in mutilating the wounded, and incite their sons to the same bloody work, were well known to the French in their Kabylene campaign. The employment of such savages in a European war is a disgrace to that nation. But it is a still greater shame that, instead of regulating the wild instincts of the Turcos, they inflame them by giving to these ignorant hirelings the most horrible descriptions of their enemies. In the year 1859 I heard Frenchmen tell the Turcos that the Austrians, against whom they were then fighting, were wild barbarians, who committed the most cruel deeds. They have been recently told similar stories of the German forces. It is a current belief even among the French in Algiers that the Germans are savages, who live like Huns and Vandals. What wonder that the Turcos believe it? May our Fatherland remain free from this scourge in the future, as, thanks to the wise management of the German leaders, it has succeeded thus far in keeping these wild hordes from German soil!

LORD LYTTON.

IN spite of the peerage, and in spite of his previous change of surname, it is with some little effort that people old enough to have read his novels a quarter of a century ago can call the author of "Pelham" even now by any other name than Bulwer. If the author of "Pickwick" had been created Lord Gadshill it would still be almost impossible for us ever to speak of him except as Dickens. The eminent man of letters, whose portrait we give, was born in 1806, and was christened EDWARD GEORGE EARLE LYTTON BULWER. He was a younger son of General Bulwer, of Heydon Hall, Norfolk. It is said that he received from his mother, a clever and accomplished woman, more of his early teaching than most boys are so happy as to get from their mothers. In his pensive and often lonely youth, as he has told us in "The Student," he was wont to pass much time at Knebworth, thirty miles north of London, the old ancestral seat of the Lyttons. He has described, with affectionate minuteness, the roomy and stately dimensions of that Elizabethan mansion, and the cool verdure of the park, with its trees, and with the placid sheet of water, upon the sedge brink of which he used to lie and dream the waking visions of enthusiastic boyhood. It is not recorded that he went to Eton, or Harrow, or to any other public school, but his instincts made him a scholar. Entered of Trinity Hall, Cambridge, he studied, we may suppose, more classics than mathematics, and won the chancellor's prize-medal for an English poem on "Sculpture." Solitary travelling was the next part of his preparation for a literary career; he rambled all over England and Scotland on foot, and on horseback through the sunny plains and vineyards of France. He printed about this time, for private circulation, a little volume of poems entitled "Weeds and Wild-flowers;" but so do hundreds of young men in the green spring-time of their lives, and write no more.

Mr. Bulwer started as a novelist as early as Mr. Disraeli, with whom, in some features of character and position, he might then have seemed to have much in common. Not to mention a tale or fragment concerning O'Neil, the Irish rebel chieftain, the list of his published novels begins, in 1827, with "Falkland;" and he wrote one or two every year, "Pelham," "The Disowned," "Devereux," "Paul Clifford," "Eugene Aram," and so on, till his mind had reached a higher stage. For it must be confessed by his warmest admirers that the novels just named, though of startling energy and versatility of talent, were not the productions of a ripe genius, or such as a mature judgment would have allowed him to put forth. "Pelham; or, the Adventures of a Gentleman," was a book of peculiar fitness for the temper of that time. People can very well help reading it now. It

no longer affords the same gratification it did when its author was barely of the age of discretion. "Books written by boys, which profess to give pictures of life and to show a knowledge of the world, are necessarily founded in affectation." So says Mr. Disraeli of his own "Vivian Grey." But we must consider the peculiar temper of that time. There was an epidemic of fashionable novels. The general public, of middling rank, had a fancy just then to peep into the saloons and boudoirs of the West End. Silver forks were lately invented, and there was a "silver-fork school" of literature to match. The adoration of exclusive "sets," associated in the pursuit of gayety and in pretensions to elegant luxury, arose from the regency and reign of George IV. A mythical legend was already current in the outside world representing the manners of the privileged few as a miracle of graceful dignity and delightful ease. The female and youthful members of the middle-class family were rather pleased with the haughty scorn which they were taught to believe was felt in the higher circles for the plebeian multitude. Any smart writer, having the *entrée* to that region of fashionable life from which they were shut out, was sure of grateful attention if he could furnish some not incredible sketch of its behavior.

The other novels of Mr. Bulwer's first period were purposely varied in style and subject. "The Disowned," which seems to have been meant for a contrast to "Pelham," displayed the figure of a hero of stoical virtue, grand in his own esteem, amid the miserable ruin of his fortunes. The plot, though too complex, showed the author's rare faculty of contriving a combination of incidents. But this story was never popular; and his next attempt, in "Devereux," was of a different kind. It was a more carefully-finished production, and the fruit of some historical study. The courts of England and France in the times of Queen Anne and George I. and of the Regent Orleans, with the splendid intriguer Bolingbroke, were portrayed in a lively manner. The moral tone of "Devereux" was higher and purer than that of Bulwer's other stories; it was free from the affectation of bantering indifference which had run through the confessions of Pelham. The surprise was the more startling, and the author lost ground the more irretrievably in the opinion of sober readers, when he suddenly plunged, with his "Paul Clifford," into the lowest haunts of vice and the depths of vulgar villany, where he literally fell among thieves by his own wilful fault. The constructive skill which he applied to "Eugene Aram" is entitled to much applause. It is a masterly piece of work, though it fails just in that part, the consistent and truthful exhibition of human character, which could alone have justified a romantic fiction treating such a hideous subject. This main defect would have been still more apparent if the author had used that village tragedy for a dramatic poem instead of a novel. The monstrous and impossible falsehood of his conception of the school-master's character would have been still more glaring—a treacherous murderer for the sordid lucre of gain, who is, at the same time, an enthusiastic scholar, a refined and generous lover, and a philanthropist longing for the redemption of humanity from evil. But the story is so circumstantially related as to excite our curiosity, appealing to the sense of mystery and terror with increasing fascination as it proceeds. Another work by Sir Edward Bulwer Lytton, produced many years later, has the same merits of artistic execution, but is liable to the same fatal objections upon the score of its treatment of a yet more repulsive subject. "Lucretia; or, the Children of Night," in spite of the special apology he felt called upon to offer, is a book that should not have been written. It is in the power of such an imaginative genius to interest the reader without performing either of the alternatives required by Horace, who says the poet should either profit or delight us. Neither in one way nor in the other can we be served by the presentment of so disgusting a pair as Oliver Dalibard and his wife, the ruthless poisoners of their friends for money, with their serpentine wriggings of intrigue through three dismal volumes, ending in a horrid catastrophe with the denunciation of a wicked mother by her own son, and the dreadful death of the son by an envenomed ring upon his mother's accursed hand.

Composed along with "Eugene Aram," as he states, to afford his mind some diversion from that dark and unwholesome theme, was Mr. Bulwer's slighter tale of "Godolphin," one of his weakest, and scarcely worthy to be published at a later period. By this time it is probable that Mr. Bulwer's views of human life were becoming more enlarged and exalted as he attained the maturity of his manhood and took his part in the active business of the day. He had entered the

House of Commons, in 1831, as member for St. Ives; and, in the next year, after the Reform Act, obtained a seat for the city of Lincoln. He was a good Whig Reformer and a strong advocate of the ballot. His opinions on many political and social topics were set forth in a series of essays called "England and the English," published in 1833, but now somewhat out of date. If the word "Philistine" had been then imported, we may presume that its signification, as lately defined by Mr. Matthew Arnold, would have expressed what Mr. Bulwer may then have deemed the special object of his antipathy and the besetting sin of our age. He now devoted himself with earnest faith and elevated purpose to the study of classical poetry, philosophy, and history, with which he joined that of Italy in the middle ages. "The Last Days of Pompeii" and "Rienzi" were the admirable results of this more worthy direction given to his genius. We need not say any thing in praise of that pure and beautiful story, which is better remembered than any of his other works, "The Last Days of Pompeii." It won the approval of scholars and men of taste by its graphic delineation of the social and domestic manners of the ancient Roman world in that gay city of the Neapolitan bay, whose marvellous destruction by the falling ashes of the volcanic fires is one of the grandest historical events. "Rienzi, the Last of the Tribunes," was founded upon a large amount of historical fact in the actual career of that enthusiastic Italian patriot, the Mazzini of the fourteenth century, who established a short-lived republic at Rome, and fell a victim to the hatred of priests and nobles. These two historical novels were, beyond all comparison, the best that had then appeared next to those of Sir Walter Scott; they were sufficient to earn for Mr. Bulwer the title of successor to that great master of English prose romance.

He had also undertaken the editorship of the *New Monthly Magazine*, which placed him in communication with many of the cleverest and most popular writers of the day. His own contributions to that periodical, consisting of sketches, didactic essays, apologues, and dialogues, which were too sententious and aphoristic for this age, are collected in two volumes, called "The Student." They betray a pass-

ing fondness for mysterious fables of an Oriental type, conveying profound lessons of human duty and destiny, which were more acceptable in Dr. Johnson's time than in ours. The influences, too, both of Goethe and Byron upon Mr. Bulwer's mind were distinctly perceptible; but he seems to have persevered with his Greek studies. In 1837 he came out as an inquirer, like Mr. Gladstone, into the literary and historical antiquities of Greece. His book, "Athens—its Rise and Fall," though superseded by later researches, showed that he had a keen insight, not into the details of ethnological or philological erudition, but into the social condition and character of that highly-gifted nation, and a fine appreciation of the Greek poets. He

resumed, about this date, the office of novelist with "Ernest Maltravers," which obtained so much success that he was tempted to follow it up with a sequel, "Alice; or, the Mysteries," relating the further development and consequences of an unhappy love-affair. These stories were acknowledged to be works of high imaginative power; they showed a great advance in the artistic faculty, and a greater in the analysis of characters and motives. They were followed by "Lelia; or, the Siege of Granada," which showed that the restless quest of exotic subjects and examples had led Mr. Bulwer to Spain. "Night and Morning," a tale of modern English society, with some adventurous scenes in Paris,

which might have been drawn by Balzac, was his next production. In 1838 Mr. Bulwer's literary distinction, added to his social position as a gentleman of good birth and fortune, besides his consistent attachment to the Liberal party, induced Lord Melbourne's government to confer a baronetcy upon him. His elder brother, Sir Henry Bulwer, was already notable in the diplomatic service.

In the same years, while gaining by repeated good hits the post of premier novelist, which he was soon to resign to Charles Dickens, he had been making himself no less the chief of contemporary dramatists then writing purposely for the London theatres. There was at that time a chance of the reception of a good original play, not borrowed from the French, but the true invention of an English author. The plays of Bulwer, "The Lady of Lyons," "Richelieu," and

LORD LYTTON.

the comedy of "Money," were found eminently fit for acting; they have been acted ever since, and Macready, Phelps, and Charles Kean, did justice to the parts he gave them. "Not so bad as we seem" was written for the amateur performances to raise a fund for the Guild of Literature and Art. But we have not yet finished the list of his prose tales. The sceptre, indeed, departed from Sir Edward in a very short time when young "Boz," after his memorable burst of fresh humor in the "Pickwick Papers," and the dashing vigor of "Nicholas Nickleby," conquered all English hearts with "Oliver Twist." As Dickens went on triumphant, and proved himself the greatest of English humorists since Shakespeare; while Thackeray, not yet much known, was about to surpass Fielding and every other novelist in his pictures of English society; and Lever was afieid in Ireland, among the jolly good fellows of sporting and military sets—there was no longer a public to care for the sentimental stories of irregular amours. It was certainly a change for the better. Sir Edward Bulwer Lytton, thenceforth leaving to his competitors, but only for a time, the domain of realistic fiction, withdrew himself to that of the miraculous and supernatural, or quack semblance thereof, in his extravagant tale of "Zanoni." The subject was probably suggested by Cagliostro, the Sicilian impostor of the last century, whom Alexandre Dumas had put to romantic use. Bulwer's story was excessively wild, and perhaps nonsensical; but those who read only for the excitement of feeling and the occupation of fancy were not disposed to object. The whole performance, like some of his others, must be regarded as an experiment; and we should say the same of "Lucrætia," and of that strange literary mystification entitled "A Strange Story," which he wrote, in 1861, for *All the Year Round*. His two English-history novels, "Harold, the Last of the Saxon Kings" and "The Last of the Barons," deserve a good place in their class; and they prove that he might, if he had chosen to undertake the labor, have produced a series not inferior, as vivid illustrations of our national chronicles, to those of Scott. But there can be no mistake as to the cherished offspring of his muse—the acknowledged *chef-d'œuvre* by which his spirit and genius must be tried. In the preface to "King Arthur," published in 1849, Sir Edward Bulwer Lytton says: "If this work be worthless, it is at least the worthiest it is in my power to perform; and on this foundation, however hollow, I know that I rest the least perishable monument of those thoughts and labors which have made the life of my life."

It is probable that many of the readers of "Pelham" and "Zanoni" have never heard of "King Arthur;" not one in ten has read it or ever could read it; but it is a noble poem for all that. It is a regular, symmetrical epic, which narrates, in harmonious stanzas, and in a strain that sounds like an echo of Tasso or Ariosto, one of the most charming of the old chivalrous legends of Britain. It is not such poetry as Tennyson's "Idyls of the King," but more like such as "The Lay of the Last Minstrel." The key-note is pitched high enough for the expression of generous ardor and pure enthusiasm, but so as to admit of easy variations to a playful and sportive tone. Its subject is the experience of the hero, Arthur, King of South Wales, in an errand upon which he is sent, by the weird Lady of the Lake, to search for three talismanic gifts, by the aid of which he may overcome the enemies of his nation and achieve immortal glory. His adventures in this quest, with the trials of his virtue, not only in the wilderness, but in the Happy Valley ruled by the fair young Queen Ægle, are told with great animation. Upon the whole, it may be admitted that "King Arthur," if not a powerful, is a graceful and pleasing composition, which comes near to fulfil the author's frequently-professed intention of exhibiting an ideal image of human nobleness, with a free poetical treatment of the surrounding conditions.

There is but one other work to which we should refer as most truly characteristic of his mind, such as we believe it sincerely to be, in its best and happiest moods, when stripped of the veils of literary artifice and rhetorical affectation. It is not "The Caxtons," which is half an imitation of "Tristram Shandy" and half a commonplace narrative, but the long story, alleged to be written by Pisistratus Caxton, and significantly called "My Novel." The author—not Pisistratus, but Bulwer Lytton—who thought this book worth an affectionate dedication to his brother, may be assumed to have meant, by its title, that he put it forth as his own genuine view of the "Varieties in English Life." It is totally unlike every thing else he has written. A better book, in the spirit which it breathes, in the tone which it sounds, in the repose of feeling, the breadth of contemplation, the

purity of style, has been written by no English novelist of our day. Upon his last novel, "What will he do with it?" we can offer no particular remark; nor have we space left to notice "The New Timon," or any of his minor poems, or his translations of Schiller and Horace. The variety of his literary tasks during more than forty years defies the attempt to classify them in order.

In the enumeration of his writings we have lost sight of his personal career, and of his eminent position in the social and political world. Sir Edward, in 1843, by royal permission, took the name of Lytton, instead of Bulwer, for his surname, on coming into possession, by his mother's will, of the estates in Hertfordshire, to which she was sole heiress. The Lyttons, formerly the Robinsons, were an ancient Denbighshire family, allied to the Tudors, and to the old sovereign princes of North Wales. In 1852 Sir Edward Bulwer Lytton, having attached himself to the Conservative party, though in many points a Liberal, was returned to Parliament for the county of Hertford, after ten years' absence from political life. He was Secretary of State for the Colonies in Lord Derby's second ministry, in 1858; and, in 1866, when Lord Derby was again premier, Sir Edward was raised to the peerage.

Lord Lytton, having been married in 1827, has a son, the Hon. Edward Robert Bulwer Lytton, born in 1831, whose poetical works, bearing the assumed name of "Owen Meredith," have been received with much favor. He is secretary of legation at Vienna.

MIGNON.

MIGNON, the subject of the engraving on the first page of this number of the JOURNAL, is one of the characters in Goethe's "Wilhelm Meister." She is an Italian girl, a wandering minstrel, homesick and sad, in the cold, harsh North. She sings of Italy in a famous song, often translated, of which we present a new and very literal version by T. E. Osmun, of this city:

Know'st thou the land? 'Tis there the lemon blooms;
'Bove shady groves the golden orange looms;
There gentle winds come sweeping o'er the land;
The myrtles still and high the laurels stand—
Know'st thou it well?
'Tis there! 'tis there
Where I with thee, O father, long to go!
Know'st thou the house? Its roof on columns rests;
Its hall of gold that wealth and taste attests;
And marble statues stand and look at me:
"What did they, then, thou dearest child, to thee?"—
Know'st thou it well?
'Tis there! 'tis there
Where I with thee, O father, long to go!
Know'st thou the mount, its cloudy path, oh, say?
The stubborn mule there seeks his foggy way;
In caverns lives the dragon-winged beast;
There high the cliffs and deep the floods thou seest—
Know'st thou it well?
'Tis there! 'tis there!
Come, lead the way! O father, let us go!

Byron imitated this song in the opening lines of "The Bride of Abydos:"

"Know ye the land where the cypress and myrtle
Are emblems of deeds that are done in their clime,
Where the rage of the vulture, the love of the turtle,
Now melt into sorrow, now madden to crime?
Know ye the land of the cedar and vine,
Where the flowers ever blossom, the beams ever shine;
Where the citron and olive are fairest of fruit,
And the voice of the nightingale never is mute;
Where the tints of the earth and the hues of the sky,
In color though varied, in beauty may vie,
And the purple of ocean is deepest in dye;
Where the virgins are soft as the roses they twine,
And all, save the spirit of man, is divine?"

NEW-HAMPSHIRE SCENERY.

WITH ILLUSTRATIONS BY A. C. WARREN.

HE was not a senseless nor an altogether ignorant man who remarked, when Hugh Miller was mentioned the other day in conversation, "Oh yes! Hugh Miller—I've read his book." But he was evidently unaware of the facts that Miller had written nearly a dozen books besides the "Old Red Sandstone;" that an equal number

of popularly comprehensible treats were yet in store for him; and that he would appear to better advantage in such conversation after he had pushed his bibliographical investigations a little further.

This anecdote is frequently brought to mind when summer travellers talk of New Hampshire. The tourist, who wants his baggage checked through to the Tip-Top House, has as little comprehension of the wonders, the sublimities, and the fascinations of the Granite State, as the man who had "read Hugh Miller's book" had of the great Scotchman. Mount Washington is not the only peak worth climbing, nor are Conway Meadows the only dream-land. The Saco and the Pemigewasset lapse down from dizzier heights, and wimple through the foreground of grander pictures; but all over the State the coquettish streams run on from beauty to beauty; the broad, green intervals are flecked with the shadows of isolated elms and fringed with the water-side willows, and lonely peaks stand up as landmarks of the Almighty, or look off beyond valley and village, beyond shore and island, far out upon the broad Atlantic. The points of observation, from which the picturesque and the poetical in landscape may be enjoyed, are numerous in almost every township. The mountain-wall with snowy cope does not always rise directly before you; but the brook forever tugs at its boulder, and the widening water keeps its youthful purity, and the powerful river tumbles and dashes itself for pastime and demands a task, and the roots of the elm and the birch seek out the kindly crevices of the confused granite, and meadow and midland and highland terrace out the landscape, and slope and curve cast themselves into the company with a graceful confidence of being never out of place. The broken and erratic soil, like the typical poet, produces little of sordid value, but much of lasting beauty, and ministers less to man's comfort, but more to his enjoyment.

A native and life-long resident of Concord, who has travelled extensively in Europe, discovered last summer, within three miles of his home, a view which he seriously pronounced more pleasing than any he remembered across the ocean. Patriotism may have prompted the emphasis; but the remark was by no means absurd. Turning into an unfrequented road, he beheld a vast landscape before and beneath him, set in a frame of successive, independent mountains, which, though at widely-varying distances, like the stars of heaven, rounded seemingly to a perfect arc. At the extreme left were the symmetrical Uncanoonucs, and then in order came Wacluset, the Francestown group, Monadnock, an unknown mountain, the Mink Hills, Sunapee, Kearsarge, Ragged Mountain, Cardigan, and the Franconia range.

From the summit of Mount Kearsarge,* in Merrimac County, one of the finest views in America may be obtained. It stands alone, in the northwest part of the county, and is a sort of French-roofed mountain four thousand five hundred feet high, with a kitchen-part half as high. From the railway-station a ride of four miles, over a road not unpleasantly steep, brings you to a public-house, built in a grove on the crest of the lower mountain, and appropriately named the Winslow House, after the commander of the vessel that sunk the Alabama. This road is skirted all the way with farms, or, at least, rocky fields laid out in squares, and carefully fenced with the too abundant stone that covers their surface. Sheep and goats pick their living among the rocks, with a commendable but pathetic industry; while the bleak farm-houses that are scattered all along to the lower summit present a living conundrum which no man can answer. By the road lie granite boulders in profusion, of astonishing variety in colors and texture. Some of them, with broken surfaces flashing in the sun, seem like jewels for a giant. Around them grow masses of golden-rod, gentian, and immortelles; and at brief intervals are veteran apple-trees, moss-bound but thrifty, their loaded branches showing that no school-boys pass this way. When you were at the station, the hills around seemed of respectable height and quite interesting; but, as you rise with the road, you see they are only the little fellows on the first form, as over their shoulders begin to peer one row after another of the larger fellows on the forms behind. The road traverses the north, northwest, and west sides of the mountain; and among the first of the pleasant surprises are the little ponds and lakes that gleam out in every direction. The most noticeable, perhaps, is Pleasant Pond, apparently circular, with Scytheville on its hither margin. From the Winslow House

you have such a prospect as many tourists are disappointed at not finding among the White Mountains—a view, from a moderate elevation, over slopes and valleys not so far off as to become indistinct or lose their smaller features. From this point, a faint path leads directly up the steep ascent to the summit of the mountain. Sometimes it passes through groves of evergreen, whose roots and boughs make steps and banister; sometimes through the dry bed of the spring-runnel, that has carried off the successive snows of centuries; and sometimes over a smooth, bare ledge of native granite, with precarious footholds at the lines of cleavage. The summit is bald and brown; and the rock, at its more prominent points, is water-worn like the piers of an ancient bridge. Here, in a clear day, you may look down upon fully one-half of New Hampshire and a portion of Vermont. The land, with its alternating woods and fields, looks as if the tawny skin of some enormous leopard had been thrown over it in crumpled folds; and two round ponds, gleaming between us and the sun, might be taken for the eyes of the monster, still unclosed. Mountains notch the horizon on every side. To the north, Lafayette with its scalloped summit, and the sharper peaks of the Franconia range, are distinct and almost neighborly; while to the right of them, a little more distant and dignified, Mount Washington towers over all. In the south rise Monadnock and Wachusett; and in the west, Ascutney and Mansfield. And all around are uncounted peaks, unnamed, or unknown. To the east, the course of the Merrimac may be traced by its broken bluffs of yellow sand; and in its valley are the symmetrical Uncanoonucs, near Manchester. About thirty ponds or lakes, many of them very beautifully nestled among the hills, may be counted. And in every direction the little villages, resting in the valleys, or clinging to the hill-sides, with their invariable white buildings glimmering in the sunlight, look like quiet cities of the dead amid the expanse of natural beauty and life.

The number of birthplaces of noted men that are in sight from the top of Kearsarge, is remarkable. On the eastern side you look almost directly down upon a district ten miles square, in which were born Ezekiel and Daniel Webster, William Pitt Fessenden, John A. Dix, Farmer, the electrician, C. C. Coffin, the well-known traveller and correspondent, the Greenes of the *Boston Post*, and the Bartlett family (including Ichabod) famous in New Hampshire. United States Senator Wilson was born in Farmington, Lewis Cass in Exeter, United States Senator Grimes in Deering, United States Senator Chandler in Bedford, Levi Woodbury in Portsmouth, Horace Greeley in Amherst, General Butler in Deerfield, Franklin Pierce in Hillsborough, Chief-Justice Chase in Cornish, and Chief-Justice Clifford, of Maine, in Rumney; and all these places may be seen from Kearsarge.

Peterboro, in the western part of Hillsboro County, a dozen miles from the Massachusetts border, has been heretofore entirely out of the lines of travel; but the completion of a railroad from Winchendon to the village of Peterboro, now makes the latter easy of access. It is near the head-waters of the Contoocook, the largest tributary of the Merrimac. Our second engraving represents the view of Monadnock from North Peterboro, with the Contoocook in the foreground. The distance represented in the picture is about ten miles. Monadnock is three thousand seven hundred and eighteen feet high, and, though far inland, can be seen from the ocean. Its base occupies an area measuring about five miles north and south by about three miles east and west. The extreme peak is what is known as Grand Monadnock. It was the inspiration of one of the best of those minor American poems, which were considered good until Lowell and Whittier gave us a higher range of national song. I refer, of course, to Mr. Peabody's poem, commencing—

"Upon the far-off mountain's brow,
The angry storm had ceased to beat."

Perhaps two of the best and most appropriate stanzas will not be out of place here:

"I've seen him, when the morning sun
Burned like a bale-fire on the height;
I've seen him, when the day was done,
Bathed in the evening's crimson light.
I've seen him at the midnight hour,
When all the world were calmly sleeping,
Like some stern sentry in his tower,
His weary watch in silence keeping.

"And there, forever firm and clear,
His lofty turret upward springs;

* A mountain near North Conway, whose right name is Pequaket, is known as Kearsarge, and has often been chosen for representation on canvas because of the famous sea-fight in the English Channel. I have it from the gentleman who suggested the name for the vessel, that the mountain in Merrimac County is the one from which the victorious cruiser was named.

MOUNT KEARSAGE.

MONADNOCK MOUNTAIN FROM NORTH PETERBOROUGH.

CONFLUENCE OF SACO AND SWIFT RIVERS, CONWAY.

EAST MOUNTAIN FROM ROBBE'S HILL, PETERBOROUGH.

IN NEW HAMPSHIRE.

He owns no rival summit near,
No sovereign but the King of kings.
Thousands of nations have passed by,
Thousands of years unknown to story,
And still his aged walls on high
He rears in melancholy glory."

The tourist is generally hurried through Conway to the more famous and alluring North Conway, five miles beyond. But if he stop either in Conway or in West Ossipee, on his way from the lake to the heart of the mountains, he will find charming landscapes that will richly reward a short delay in reaching the mountains. Our third engraving represents the confluence of the Saco and Swift Rivers at Conway. The spectator is looking directly west, with the famous Chocorua and its outlying range at the left of the picture, and Mote Mountain at the right. Chocorua is three thousand six hundred feet high; Mote Mountain, three thousand two hundred. The stream spanned by the bridge is Swift River.

The fourth engraving shows East Mountain, in the town of Temple, seen from Peterboro. The foreground and middle distance may be taken as a fair specimen of what may be seen from thousands of ordinary door-yards in New Hampshire. A spot two miles west of the capital, commanding very much such a view, was chosen by the late ex-President Pierce as the site of his permanent home. But the loss of his wife caused him to relinquish the design of building on it; and to-day the wide, sloping lawn, uncut by gravel walk or wheel-marks, the houseless grove of forest-trees, and the long, curving sweep of granite wall, flanked by gateway towers at either end, excite the wonder and the question of the passer-by.

ROSSITER JOHNSON.

AN ENGLISHMAN'S IMPRESSIONS OF AMERICA.*

THIS volume is from the pen of Mr. W. F. Rae, attached to the editorial corps of the *London News*, who visited America, and made the Western tour to San Francisco, in 1870. "Although," says the preface, "two series of letters, the one entitled 'New York to San Francisco,' the other 'A Visit to the Mormons,' which recently appeared in *The Daily News*, form the basis of this volume, yet those who have perused these letters will find that the revision they have undergone is so thorough, and the additions made to them are so considerable, as to constitute the volume itself an entirely new work in substance, if not in name. Like the famous stockings of Sir John Cutler, these productions now resemble, in general outline only, that which they were originally."

IMPRESSIONS OF NEW YORK.

"When I first saw New York it did not appear to me a foreign city in the same sense as Paris, or Frankfort, or Milan. A closer and more leisurely examination produced a different impression. To walk along Broadway recalls a walk along Regent Street, but it also recalls a walk along the Rue de la Paix. What seems to be English is rivalled, if not outdone, by what is unmistakably French, while many things have neither a French nor an English impress. The architectural effects are extraordinary in their variety. The want of simplicity and repose is as marked as the absence of a distinctively national style. Every one has apparently followed the bent of his fancy, and the straining after originality has led to a confusion of ideas and a clashing of aims.

"All nationalities seem to have sent their representatives to this city. Half the languages of Europe are spoken by the motley gathering. The English tongue is in the ascendant; but the eye fails to see many figures or faces to match the hereditary language. The ladies are dressed in the latest French mode, yet the fashion of their apparel is the only thing they have borrowed from Paris. Their looks are native to the soil, and to call them good is not to speak of them in language sufficiently eulogistic. The men are dressed with a regard for appearances which is more common in Paris than in London. There is none of the uniformity in their attire which is akin to monotony. All do not seem to have been condemned, by a law which cannot be gainsaid, to wear the same hideous hat. The 'wide-awake' is as common as the 'chimney-pot' and the mixture of the two produces a pleasing effect.

"The purity of the air is delicious. If a dwelling be built of marble, or brick, or stone, the beholder has no difficulty in pronouncing as to the nature of the material, and has the satisfaction of duly appre-

ciating the whiteness of the delicate marble, the warmth of the brick, the solidity of the stone. The principal streets are broad; the principal squares are spacious. The several avenues which run parallel to each other throughout the greater part of the city are so wide that the tramways which are laid in them do not in the slightest degree interfere with the traffic. For the passage of all conveyances there is room enough and to spare. At the upper end of the city is the Central Park. This public ground covers an area of more than eight hundred acres. It is laid out in a style resembling the Bois de Boulogne rather than Hyde Park and Kensington Gardens. Several years hence when the trees shall have attained their full height the Central Park will be second to no other place of the kind.

"In my opinion scant justice has yet been done to New York on the whole. It has its drawbacks, as has every city on the face of the globe, but it possesses excellences which more than outweigh them. The man of business finds it as good a centre for his operations as London. The pleasure-seeker can amuse himself as well as in Paris, while men of letters and students of art affirm that the prospects of New York becoming an honored home of literature and art grow brighter every day."

CHICAGO.

"By the residents Chicago is often styled the 'Garden City.' Both its citizens and its admirers sometimes claim for it the still more dignified title of the 'Queen City of the West,' or the 'Queen City of the Lakes.' The pride they take in it is extreme, and the language in which they express their feelings is high-flown. This appears quite natural to the traveller who has journeyed from England to the United States in order to witness the marvels which human industry and energy have wrought on the surface of the vast American Continent. Books and newspapers may have prepared him for an extraordinary spectacle, yet neither tables of statistics nor any printed statements can enable him to realize the grandeur of the impression produced by a stay, however short, in the modern city of Chicago. With a sensation of incredulity hardly to be repressed, he listens to the stories which tell of the city's foundation and history. Forty years have not yet elapsed since the site of palatial dwellings was distinguished from the surrounding wilderness by a log fort, in which two companies of soldiers were stationed for the protection of a few traders who collected furs from the Indians in exchange for trinkets. In those days civilized men regarded a visit to the shores of Lake Michigan much in the same light which many persons now regard a visit to the sources of the Nile. Those who made the journey had to brave the attacks of ferocious animals; had to face the perils incident to an inhospitable and uncultivated region; had to live in constant dread of an attack from Indians more deliberately cruel than any beast, and more crafty than any other enemy in human shape. The wild men and wild animals have both disappeared. The land which once yielded a precarious subsistence to the hunter now repays the skilful farmer one hundred-fold. Where weeds formerly thrived in rank profusion peach-trees are now heavy with precious fruit. A city of palaces has taken the place of a few miserable hovels. Similar transformations have occurred in other parts of the globe. Venice and Holland do not fall short of Chicago as evidences of what man can achieve in his struggle with rugged Nature and hostile elements. Yet the growth of either city was the work of many years, as well as of much toil; whereas Chicago has waxed great and famous within the memory of men still living, and not yet old. If another Queen Scheherazade were compelled to rehearse a tale of enchantment for the gratification of an exacting husband, she might find in the authentic story of the rise of Chicago materials which would produce a result as striking as that caused by a recital of the fabulous doings of Aladdin."

FIRST SIGHT OF INDIANS.

"The first real sensation is obtained at Jackson, a small station a hundred miles west of Omaha. Here many of the passengers see genuine Indians for the first time—that is, men who live by hunting, and who glory in getting scalps. They are Pawnees. We are told they are friendly Indians, being supporters of the United States Government. They may be friendly at heart, but they are blood-thirsty in appearance. They probably consider themselves civilized, for each carries a revolver in a belt strapped round his waist. That they are staunch adherents to old traditions is proved by an inspection of their encampment. Outside the tents are poles stuck into the ground. From the tops of these poles, wisps of hair flutter in the breeze. The seeker after knowledge naturally asks the meaning of these things. His belief in the friendliness of the Pawnees is not strengthened when he is informed that the wisps of hair are trophies of victory which have been cut from the heads of vanquished foes. The Indians, whose advance in civilization is manifested by the addition of the revolver to the scalping-knife, are not persons for whom it is possible to entertain great admiration. Their acquaintance is more to be avoided than courted. Seen at a distance, they are picturesque additions to the landscape; when met by the defenceless traveller, they prove to be brutal monsters. The chief testimony given in favor of the Pawnees is that they are better than the Sioux, and that they are always ready to demonstrate their loyalty to the Union by murdering the Sioux without mercy."

* "WESTWARD BY RAIL: The New Route to the East." By W. F. Rae. New York: D. Appleton & Co., Publishers.

TROUT-FISHING IN WYOMING.

"Sherman Station, the highest point on the Pacific Railway, is in the Territory of Wyoming, the youngest among the Territories of the United States. Some writers strongly advise the traveller to make a halt at Sherman Station. The inducements held out to him are mountain-scenery, invigorating air, fishing, and hunting. A sojourn among the peaks of the Rocky Mountains has the attraction of novelty to recommend it. Life there must be, in every sense of the word, a new sensation. But some sensations are undesirable, notwithstanding their undoubted freshness. That splendid trout swarm in the streams near Sherman admits of no dispute. Yet the disciple of Isaac Walton should not be tempted to indulge rashly in his harmless and charming sport. It is delightful to hook large fish, but it is less agreeable to be pierced through by arrows. Now, the latter contingency is among the probabilities which must be taken into consideration. A few weeks prior to my journey, one of the conductors of the train by which I travelled learned, by practical experience, that fishing among the Rocky Mountains has palpable and painful drawbacks. Having taken a few days' holiday, he went forth, fishing-rod in hand, to amuse himself. While whipping the stream, in the innocence of his heart, he was startled to find himself made the target for arrows shot by wild Indians. He sought safety in flight, and recovered from his wounds to the surprise as much as to the gratification of his friends. His story did not render me desirous of sharing his fate. The trout-fisher might employ his leisure to greater advantage elsewhere than in the Territory of Wyoming."

GAMBLING.

"After passing Corinne, around which the country is fertile and well-cultivated, the line runs through a barren tract, skirts the shore of the Great Salt Lake, and ascends the side of Promontory Mountain. The gradients here are very steep, and the cuttings in the rock must have been made with much expenditure of toil and money. Two trestle-bridges are crossed, a sharp curve is rounded, and the station of Promontory is reached. This is the western terminus of the Union Pacific, and the eastern terminus of the Central Pacific Railway. The town is built partly of canvas and partly of wood, and has but one street. The signs are hardly in keeping with the structures to which they are attached. Over a shanty is painted, in large letters, 'Pacific Hotel,' and over a tent, 'Club House.' One of the wooden dwellings attracts notice on account of the neatly-arranged muslin curtains within the window. Unlike the others, it has no sign-board to indicate its purpose, but a glance through the open door satisfies the curiosity of the passer-by. He sees two or three smiling females ready to extend welcomes to whoever will enter in. This is characteristic of all these rude settlements in the wild Western country. In a canvas town, the abode of women with few scruples to overcome, and no characters to lose, is as distinguishable, and as much a thing of course, as the gambling-hell and the drinking-saloon. Of drinking-saloons there are many at Promontory, but there is only one gambling-hell as far as I could learn. This one is quite enough for the place. In its way, the hell is unique. The object of its keepers is to entice the passengers halting here to try their luck. With this view, agents are sent to the neighboring stations, where they take their places in the cars, and enter into conversation with the occupants. Of course, as soon as the train stops at Promontory, these agents lead the way to the gaming-table. Nor have they far to go. It is in the open air, within a few yards of the line. The game played is three-card monte. It is as simple as thimble-rig. Three cards are laid out in line with their faces downward. Let it be supposed that these are a jack, a king, and a queen, the denomination of the cards making no difference—the dealer will then challenge any one to point out one of them, say the jack. A stake of a twenty-dollar gold-piece depends on the event. In front of the card-dealer is a pile of these gold-pieces. He addresses the on-lookers as follows: 'Gentlemen, you have your eyes against my hand. You see how I place the cards,' moving the three backward and forward, and then laying them in a row. 'Now I will bet any one of you that he does not point out the jack; if he does so at the first chance he wins his money, if he fails he loses it.' One of the by-standers inquires if he will bet without touching the cards, to which the reply is: 'Certainly, sir; I will bet any thing, from twenty to one hundred dollars, that you do not point out the jack.' The speaker steps forward eagerly and excitedly, places a twenty-dollar gold-piece on the table, and points to a card, which, when reversed, is seen to be the right one. He gets his twenty dollars, which he clutches, and then makes off rapidly, as if surprised and delighted at his good fortune, carrying off, also, the winning card in the excitement of the moment. The card-dealer calls upon him to return the 'ticket,' adding, 'By golly, sir, you have beaten me this time, but you are as welcome to the money as if you had worked hard for it.' This is repeated several times, the keeper of the table invariably losing. Indeed, the game seems absurdly easy, as there is always a small black speck on the back of the winning card, and every on-looker thinks it a certainty to point out this card. At last, after the dealer had lost repeatedly, a man came out of the tent behind the table, saying, 'Come, now, partner, you had better stop; this won't do.' To which he replies, 'By golly, I will play till I lose every cent I have in the world. I must win nine times out of ten, and I am ready to bet any gentleman one hundred dollars that he does not point out the right

card this time.' The truth is, the men who had staked and won were what we call confederates, and what are here called 'cappers.' They certainly played their parts exceedingly well, and would have imposed on any other set of spectators than one composed of old Californians, who are too knowing birds to be caught by the chaff of card-sharps. They are well acquainted with the trick of the game. I saw a poor German baker, destitute of experience, and endowed with but little sense, dispossessed in a few minutes of all that he had in his pockets. The trick consists in being able to deceive the spectator by shifting the small black speck on the back of the cards in such a way as to make him point to the wrong one. When the betting is real, the 'bank' never loses."

ENTERING CALIFORNIA.

"Summit Station, though the highest point on this line, is not so high as Sherman Station on the Union Pacific. It is seven thousand and forty-two feet above the level of the sea. This represents not the altitude of the Sierra Nevada range, but only the elevation of this mountain-pass. Above the station the peaks of the mountains tower cloudward. The scene is one of unprecedented grandeur. Owing to the delay caused by the accident I have described, the speed of the train had been increased. The engine-driver had been running extra risks in order, as the Americans phrase it, to 'make time,' so as to arrive 'on time.' The descent was thus made with exceptional rapidity. From Summit Station to Sacramento the distance is one hundred and five miles. Between these places the descent from a height nearly half as great as that of Mont Blanc to fifty-six feet above the sea-level has to be made. The velocity with which the train rushed down this incline, and the suddenness with which it wheeled round the curves, produced a sensation which cannot be reproduced in words. The line is carried along the edge of declivities stretching downward for two or three thousand feet, and in some parts on a narrow ledge which had been excavated from the mountain-side by men swung from the upper parts in baskets. The speed under these circumstances seemed terrific. The axle-boxes smoked with the friction, and the odor of burning wood pervaded the cars. The wheels were nearly red-hot. In the darkness of the night they resembled disks of flame. Glad though all were to reach Sacramento, not a few were specially thankful to have reached it with whole limbs and unbruised bodies."

"The charm of the last few hours is indescribable. It owed its effect to the striking contrast between the experience of the past and the pleasure of the moment. To nothing can it so aptly be compared as to that impressive passage in the inspired vision of the great Italian poet which tells how, after having painfully traversed the circles of hell, he at last entered the 'dolorous realm' ribbed in everlasting ice, then, issuing forth through an outlet, he returned to the 'bright world,' beheld the beautiful sights of heaven, and saw the stars again. But a few hours ago we were passing through a region in which desolation reigned supreme; a region of sage-brush and alkali-dust, of bitter water and unkindly skies. Still more recently the icy winds of the snow-crowned Sierras had chilled us to the bone. The transition was sudden and the transformation magical. The sun descended in a flood of glory toward the Pacific Ocean, while the train was spinning down the ringing grooves of the mountains. The canopy of azure overhead, unfecked by a cloud and spangled with myriads of brilliant stars, surpassed in loveliness the brightest and most serene sky which ever enchanted the dweller on the luxuriant shores of the blue Mediterranean. No Italian air was ever more balmy, nor evening breeze through vineyard or olive grove more grateful to the senses than the soft wind which, tempered by the coolness of the distant ocean and odorous with the rich perfumes of the neighboring plains, now fanned our cheeks and gave a fresh zest to life."

SACRAMENTO.

"After all that I have said about this city, it may be a surprise to read that the number of its inhabitants does not exceed between twenty-five and thirty thousand. It is the more noteworthy, then, that it should merit so much attention. A glance at the spacious streets stretching away on all sides for long distances leads the beholder to suppose that, as the area of the city is large, the number of its citizens must be large also. The majority of the houses have gardens attached to them. Rows of stately trees line many of the streets. The vegetation is on a scale of tropical richness. The weeds appear to be shrubs, and the shrubs resemble small trees. Other pests besides weeds abound here in rank profusion. The mosquito-curtains which closely surround the beds are significant tokens of the prevalence of a form of insect-life with which most persons would gladly dispense."

"When it is considered that not many years ago Sacramento was the haunt of the most reckless and depraved of the earth; the temporary home of men who came to dig for gold, and who lavished the gold of which they became possessed in riotous living and in the vilest profligacy, the marvel is to find how thorough has been the change, how complete the purification. The streets of Sacramento are as quiet at night as the streets of Boston. A Maine liquor law is unknown, drinking-customs are in the ascendant, yet drunkenness is not the vice of the majority. Whereas formerly every man carried a revolver, and used it on the smallest provocation, or even out of mere

wantonness of brutality, it is now the exception to go armed, and the rare exception to hear of dastardly murders having been committed either in passion or cold blood. At night the streets are ablaze with gas and guarded by vigilant policemen. The peace is strictly preserved, and the lawless stand in terror of the judges. One relic of the olden times still survives. Gaming, the miner's favorite pastime, flourishes in defiance of the law, or, perhaps, with the connivance of the authorities."

AMERICAN WOMEN.

"From points about which travellers differ, it is a pleasure to turn to one about which there has been, and must be, perfect unanimity. The beauty of the women is without the pale of controversy. It cannot be likened to the beauty for which English girls are deservedly and universally admired; for which Italian maidens have been immortalized on canvas or in verse; for which the sprightly damsels of France and the coquettish ladies of Spain have won applause, and by means of which they have made conquests. If I were to select a particular locality in the United States, I might truthfully compare the type of beauty predominant there to that of a particular country in the Old World. But America is a world in itself. Within the bounds of the Republic of the West are all the climates which give diversity to Europe, from Rome to Copenhagen and from London to Madrid. Where climates vary, female faces vary also. In New England may be seen those delicately-chiselled features and transparent complexions which in Europe are characteristic of the fascinating beauties of the North. In the Southern States the imperious and indolent Spanish women, with their amorous eyes and raven hair, have been reproduced at the distance of many thousand miles from Andalusia and Castile. Let the traveller cross the continent till the Pacific slope is reached, and there the soft and delicate beauty of Italy, combined with an intelligence wholly American and a physique wholly English, delights and surprises him. Nor are good looks the sole dower of American girls. They are more French than English in the acuteness with which they argue. They are passionately fond of the frivolities of existence, yet they follow with interest the course of the graver topics of the day. On political questions they are ready to take sides, and they discuss the issues involved in a controversy with zest and understanding. Their patriotism is not a profession, but a passion. The intensity of their devotion to their country imparted superhuman vigor to the struggle when North and South faced each other in battle array. The women of the South were the soul of the Confederacy. The women of the North saved the Union. If the women of America were more kindly disposed toward England, the relations between the two countries, at this moment, would be more cordial and more secure."

FEELING TOWARD ENGLAND.

"Nothing gratified me more than the feeling of kindness toward the Old Country which I found pervading the American people. The bitter and undying animosity about which much has been written exists on paper only, or in the distempered minds of irreconcilable Fenians. In this particular the press is not a faithful exponent of the public sentiment. A disposition to construe in the worst sense all the actions of the United Kingdom and to discredit her on every occasion and in every imaginable way, is certainly the characteristic of the press of New York. I believe this to be mere sound and fury, wholly devoid of significance. It is the relic of a traditionary policy, rather than the token of a living and active hostility. To find a parallel to it, we have not far to seek. Long after the English people were on a footing of amity with the French, the tone of the press toward France was little more friendly and complimentary than in the days when it was the bad fashion to style Frenchmen our hereditary foes. The change in public opinion has now been responded to by the press of England, while that of France, reluctant to allow old jealousies to subside into oblivion, still harps on the imaginary plots and intrigues of perfidious Albion."

ABOUT CIGARS.

IT is strange, among nations of smokers other than the Cubans or Spaniards, how little understood are the distinctive marks by which manufacturers indicate the make, shape, size, color, and quality of cigars.

One may frequently hear gentlemen offer a *Concha*, a *Regalia*, or a *Londres*, under the impression that they convey the idea of some superior brand of especially fine quality. Instead of this, they only offer a cigar of a certain size or shape, the quality of which may be any thing, from the finest "Upmann" or "Cabarga" to the poorest "Connecticut." Or you are offered a good *Maduro*, which is not made by Mr. Maduro, but is simply a cigar of a ripe or dark color.

To any one with a very scant smattering of Spanish the various marks used by the trade on their cigar-boxes are readily explainable.

The first and most important of these is, of course, the *brand*—so called from being usually burned on the box by a hot iron. This is either the name of the individual proprietor, the manufacturing firm, or the special fancy name given to the factory, in accordance with a Cuban custom which so designates their retail-shops—as, "The Pearl," "The Rose of Seville," etc.—or as though Ball, Black & Co.'s establishment were here known as the "Golden Eagle," instead of by their name.

The brands, then, are either such as "Upmann & Co.," "Cabañas y Carbajal," "Cabarga & Co.," or the well-known "Figaro," "La Corona" ("The Crown")—Antonio Cabarga's brand—or "Flor del Fumar" ("The Flower of Smoking")—Barruete's brand—lately coming into high favor. These are the special trade-marks of the factories indicated.

Next in order comes the indication of style—i. e., size and shape—and the terms used are, as a rule, common to all manufacturers, very few making any designated shape or size exclusively.

This mark is stencilled, usually, on the front of the box. The best known, and most familiar of these to our ears now, are:

Regalia—about the same as our word "present," or "gift"—the largest ordinary size.

Media Regalia—half *Regalia*—a smaller cigar.

Regalia del Rey—King *Regalia*—smaller.

Regalia de la Reina—Queen *Regalia*—smaller still.

Londres—London—a medium size for length and thickness, so called as being a favorite size in England.

Brevas—named from a luscious variety of the fig grown in Spain.

Concha—meaning a "shell," but really named after the late Captain-General Concha.

Conchas de Regalo—Conchas for presents.

Napoleones and *Imperiales* are extra-large fancy sizes, but little used, except for showy presents.

Besides these, there are some compound indicators of size and style—as, *Regalia Britanica*, *Regalia de Londres*, *Londres Corta* (short), and others.

Among shape and size marks there are two, now seldom heard, but no doubt familiar to many readers—the *Trabuco* ("Blunderbuss"), a short, thick, "dumpy" cigar; and its direct opposite, the *Panolda* ("Sponge-cake"), a long, slim article, apt to be hard-rolled and difficult to smoke, evidently the sort referred to by Dr. Holmes in his "Latter-Day Warnings"—

"When Cuba's weeds have quite forgot
The power of suction to resist."

Another indicator of the style of cigar, or, more properly, its style of packing, is found in two words—*Cilindrados* and *Prensados*—which may be applied to any size and shape. The first merely signifies that they are in *cylindrical* bunches, rolled in paper or tied with ribbon; the second, that they are *pressed* while moist, so as to present two flat surfaces.

The indications of shape, size, and style, are collectively understood by the Havana makers as the *Vitola*—accent on the second syllable.

Next in order come the indices of quality, or grade of tobacco. *Flor* ("Flower") is now the most usual mark for the best, or what used to be called "Firsts;" *Segundo* ("Second"), or, with some makers, *Superior*, for the next. Lower grades, known as "Thirds," are not generally marked, although some factories use *Bueno* ("Good") for that quality.

These marks are stencilled, usually, on one end of the box, while on the other is the indication of color. This is, of course, expressed by the proper Spanish word, as:

Claro—clear, i. e., light-colored.

Colorado (literally, red)—brown.

Maduro (ripe, mature)—dark.

Oscuro (obscure)—very dark.

These, again, are combined to fit intermediate shades—as, *Colorado-Claro* (light brown), *Colorado-Maduro* (dark brown). These guides to color are, however, not very accurate, as the "Light Brown" of one box may open as dark as the simple "Brown" of another.

A still lighter color than *Claro*—seldom seen here, as it goes mostly to Spain—is *Pajizo*, or straw-color, a very mild grade of the weed, which, if my memory serves me, used to be known as *In-jurado*.

With these explanations, then, it will be readily understood that,

if a friend offers a "Regalia del Rey, Cabarga, Colorado, Flor," he tenders a *Cabarga's King Regalia, Brown, First Quality*, and I can only add that it is hard to beat.

Fashion is fickle in cigars, as in other matters, and the brand or shape in vogue to-day is out of favor to-morrow. The once popular *Normas* and *Noriegas* have disappeared, like the *Trabucos* and *Panelas*; and that old favorite, the little black *Principe*, of fine *Yara* tobacco, with its snow-white ash, is no more seen of men. In those days, too, a first-class cigar could be had for thirty dollars the thousand—the "good old times!" *Eheu fugaces!* How have the smoky risen!

A. STEELE PENN.

CORRESPONDENCE.

DARWINISM.—APES OR FROGS?

To the Editor of *Appletons' Journal*.

SIR: Your criticisms of Darwin's "Descent of Man," in the *JOURNAL* of February 11, 1871, are very just. That word *assumption* tells the whole tale. The facts on which he relies to prove his theory of development are not selected as judiciously as they might have been. There are difficulties in the ape theory that he does not remove, and some of them would not be in his way if he had given us frogs, instead of monkeys, as our ancestors.

It is certain the frog contains many bones which correspond with the bones of man, and, if there is any difference, it may be accounted for on the ground of development. The same is true of the brains of the two types. As to the similarity of disease, there is not a school-boy who has not heard that, by a certain process, the frog can cause the hand of a man to become full of warts, and although the frog has great tenacity of life, yet in the process of pouncing, or lofty tumbling, both frogs and men find death, or bruises. That frogs will eat something that men eat, though men sometimes eat them, can easily be proved. As for parasites, internal and external, the frog has them in abundance.

The frog is developed from an ovule; and no observation, as yet, proves "that, at a later period when the extremities are developed, the feet of frogs, and lizards, and birds, no less than the hands and feet of men, do not arise from the same fundamental form."

Man has a love and a talent for music. So has the frog. I had for several years a frog under my steps, that always came out of an evening when I was playing the flute, and jumping upon my foot would remain there as long as I played. Then, for their own music! For hours I have listened to them in concert, and in time, causing the marshes and the lakes and ponds to resound with every note and every key of the gamut. Even blind Tom is compelled to own himself vanquished at his efforts to imitate their multitudinous variations. Jenny Lind and Mr. Kellogg give it up in despair. The tongue of the frog much resembles that of a man, and the vocal organs need only further development to make them perfect. With but little stretch of imagination the searcher of lost cattle has heard the frogs say, "Bob Jones, Bob Jones, here's your cows, here's your cows." And when he has waded into the swamp, and become nearly overwhelmed, he has been derided with "Ay, ye fool; ay, ye fool." If this is not so, then often in my infancy my nurse deceived me by a most Münchhausen story.

That frogs sometimes try to metamorphose themselves into other animals by swelling, we have the authority of *Æsop*, that most veritable of all fable-writers. Their bursting up without succeeding is very much like some of Darwin's developed apes. The assumption, from analogy, that either man or ape came first from frogs, is as strong as assumption ought to be. And, if Darwin had only started with the frog, he would have saved himself from that cruel blow you gave him when you said, "He has not been able to find, in the whole course of Nature, one single proof to confirm his assumption—not a monkey changing into a man—or a fish growing into a land animal." Here, sir, I beg you to turn Darwin's attention to the frog. What do we see? All the conditions of his theories complied with. What is that we see in the still water? A nebula or molluscous something; in it an ovule, in that ovule protoplasm, or force, or motion, or life, or something, call it *nature*, if you please, that develops into a living being and grows. It seems to be a kind of fish. It grows, and has gills, and mouth, and a finny tail. We call it a tadpole. Watch it! Its tail grows shorter, contracts, becomes entirely absorbed, disappears as completely as the hole of the Know-Nothing's cave, into which, after he had entered it, he took the hole in with

him, and left not a trace behind. No "one or two basal ones only embedded;" but, as the old negro shouted, in response to the prayer that the power of Satan might be curtailed, "Amen, cut he tail smack, smooth off!" The whole tail is gone, so that even McAllister's microscopes cannot detect in the os coccyx any remains of it! And still, look! See the arms and legs, the hands and feet, the thumb and great toe, waiting to be modified, developed, whenever it shall be necessary for this now four-footed or rather biped and bimanus animal to become a man! See this singular development, adapted to live in water, living on land, climbing trees, trying to stand upright, using its hands; acquainted with botany, not only with the plant's appearance or form, but its medicinal virtues, as is manifest from its eating plantain to cure the bite of a spider; and say, what presumption there is in the assumption that it may not yet be developed into a man; nay, that it has not been! Is not this theory all the more probable, because facts, things visible and tangible, prove the change, and the entire absorption of the tail? It is true, Darwin maintains that the "tail is not of much importance to some animals." My great favorite, *Æsop*, whose animals had all been developed into talkative and talking things, contradicts this assumption. A certain fox called a convention of his kind. He spoke to them about the uselessness of tails; told them, as Darwin does, "that all tails taper toward the end" (except the broad-tailed sheep) whether they be long or short; that they might become subject to "atrophy of the terminal bones, and so become completely embedded within the body, and leave nothing but an os coccyx, consisting of a few basal and tapering segments of an ordinary tail." He advised them to escape this atrophy by cutting their tails off at once. An old fox, given to assumptions, suggested that it was possible this truly benevolent advice might have resulted from the fact that this friend of tailless foxes had lost his own in some predatory excursion. On examination and an appeal to facts, the convention voted against the recommendation, and kept their tails. The acknowledgment "that no explanation has ever been given of the loss of the tail of man or monkey" is a presumptive assumption that man had a tail, or is developed from a race that had. Take the frog for the origin, and we have the facts of the tail and its disappearance; and of a wonderfully progressive development, from the mollusca to the thing that in many things resembles some things in man. Why reject facts and frame theories on assumptions? As Nature, without any wise forethought, or well-planned, watchful, designed system, only develops, or, in other words, as there is no superior, superintending power but Nature working by protoplasm, one presumption or assumption is as good as another. Let us, therefore, take the frog instead of the ape for our ancestor. Or, if Darwin prefers it, let the apes which have lost their tails be developed from the frog, and the frog from the tadpole, and the tadpole be developed throughout all developments down to the time when Nothing gave the order, "Go it blind, but develop as you go." Surely we ought not to be ashamed to own our origin to a blind chance, a nothing, nor blamed for the developments of a being whose "eminent distinction is the want of tail," nor for being like our ancestors.

Still, in spite of "science," and of Mr. Darwin's "facts," I must be permitted to believe that there is a God who made, sustains, and governs all things, and that He made us, and is our Father.

T. P. H.

SONNET.

SOME things there are that may be, spite of Fate,
And some there are that must be, spite of men:
Infinity can choose not but create;

Mortality can 'scape not, but again

Must render back that which no rendering shows,

For, wanting that which yet it must become,

E'en while it rendereth into this it grows—

Yet oft best speech is still while lips are dumb.

Faith is not faith that less than all believeth,

Nor love is love that loveth as it will;

Love giveth ever more than it receiveth,

And ever, as it giveth, groweth still.

Death lives in life, and life in dying breath—

Love, e'en in dying, all things vanquisheth.

L. BRUCE MOORE.

TABLE-TALK.

THE new school of poetry which has so suddenly sprung up is at present the most noticeable feature of our literature. The "Heathen Chinese," of Mr. Brett Harte, and the "Little Breeches," of Mr. John Hay, the leading specimens of this new school, are popular to an extent almost without example. Quotations from them are heard on every side and among all classes, and they are even gaining currency in England, though their peculiarly American humor is hardly likely to be fully relished in that country. The secret of this universal popularity is, of course, their humor, their keen though good-natured satire, the freshness of their topics, and their strong and racy flavor of Western life. The Chinaman is just now one of the chief problems of American politics and society, and Mr. Harte has hit with admirable force and felicity the main features of his Californian connection with the "Melican man." We presume that most of our readers have seen the poem, but, even those who have, will be glad to have it in a form for permanent preservation, and we shall, therefore, copy it, premising that it professes to be the "plain language" of a Californian rowdy, who calls himself "Truthful James." It appeared first in the *Overland Monthly*:

"Which I wish to remark—
And my language is plain—
That for ways that are dark
And for tricks that are vain,
The heathen Chinese is peculiar,
Which the same I would rise to explain.

"Ah Sin was his name;
And I shall not deny
In regard to the same
What that name might imply,
But his smile it was pensive and childlike,
As I frequent remarked to Bill Nye.

"It was August the third;
And quite soft was the skies;
Which it might be inferred
That Ah Sin was likewise;
Yet he played it that day upon William
And me in a way I despise.

"Which we had a small game,
And Ah Sin took a hand:
It was Euchre. The same
He did not understand;
But he smiled as he sat by the table,
With the smile that was childlike and bland.

"Yet the cards they were stocked
In a way that I grieve,
And my feelings were shocked
At the state of Nye's sleeve;
Which was stuffed full of aces and bowers,
And the same with intent to deceive.

"But the hands that were played
By that heathen Chinese,
And the points that he made
Were quite frightful to see—
Till at last he put down a right bower,
Which the same Nye had dealt unto me.

"Then I looked up at Nye,
And he gazed upon me;
And he rose with a sigh,
And said, 'Can this be?
We are ruined by Chinese cheap labor'—
And he went for that heathen Chinese.

"In the scene that ensued
I did not take a hand,
But the floor it was strewed,
Like the leaves on the strand,
With the cards that Ah Sin had been hiding,
In the game 'he did not understand.'

"In his sleeves, which were long,
He had twenty-four jacks—
Which was coming it strong;
Yet I state but the facts;
And we found on his nails, which were taper,
What is frequent in tapers—that's wax.

"Which is whv I remark.
And my language is plain,
That for ways that are dark,
And for tricks that are vain,
The heathen Chinese is peculiar,
Which the same I am free to maintain."

Very touching is the righteous horror of the virtuous Mr. Bill Nye and his confederate on discovering the duplicity of the "heathen Chinese" with "his smile that was childlike and bland," and very effective his mournful expression of the great Californian politico-economical truth that "we are ruined by Chinese cheap labor," and very satisfactory also his vigorous vindication of Christian and Caucasian morality when he "went for that heathen Chinese." It is to these skillful touches, appealing to current topics and to the passion for our national game of euchre, that the poem owes its great popularity.—"Little Breeches" belongs evidently to the same school as the "Heathen Chinese," but its topic is theological, not political. It is a Pike-County view of special providences, and is meant to be religious and reverential in thought, however rough and rowdy in expression:

"I don't go much on religion,
I never ain't had no show;
But I've got a middlin' tight grip, sir,
On the handful o' things I know.
I don't pan out on the prophets,
And free-will, and that sort of thing—
But I b'lieve in God and the angels,
Ever sence one night last spring.

"I come into town with some turnips,
And my little Gabe come along—
No four-year-old in the county
Could beat him for pretty and strong.
Peart and chipper and sassy,
Always ready to swear and fight—
And I'd larnt him to chaw terbacker,
Jest to keep his milk-teeth white.

"The snow come down like a blanket
As I passed by Taggart's store.
I went in for a jug of molasses,
And left the team at the door.
They scared at something and started—
I heard one little squall,
And hell-to-split over the prairie
Went team, Little Breeches, and all.

"Hell-to-split over the prairie!
I was almost froze with skeer;
But we roused up some torches,
And sarched for 'em far and near.
At last we struck hosses and wagon,
Snowed under a soft white mound,
Upsot, dead beat—but of little Gabe
No hide nor hair was found.

"And here all hope soured on me,
Of my fellow-critters' aid—
I jest flopped down on my marrow-bones,
Crotch-deep in the snow, and prayed.

By this, the torches was played out,
And me and Ierul Parr
Went off for some wood to a sheep-fold
That he said was somewhar thar.

"We found it at last, and a little shed
Where they shnt up the lambs at night.
We looked in, and seen them huddled thar
So warm and sleepy and white.
And THAR sot Little Breeches and chirped
As peart as ever you see,
'I want a chaw of terbacker,
And that's what's the matter of me!'

"How did he git thar? Angels.
He could never have walked in that storm.
They jest scooped down and toted him
To whar it was safe and warm.
And I think that saving a little child,
And bringing him to his own,
Is a derned sight better business
Than loading around the Throne."

The humor of this, it will be seen, consists in the contrast between the good little boy of Pike County—

"Peart and chipper and sassy
Always ready to swear and fight"—

and the good little boy of the regions where Sunday-schools are in vogue. The Pike-County father regards the ability of his four-year-old son to swear, fight, and "chaw terbacker," as something to be proud of, and as comprising just the qualities and accomplishments that would recommend the young innocent to the consideration and care of the angels. He is not surprised, therefore, to find his little lamb among the other lambs, and holds it perfectly natural and proper that his first remark after his miraculous deliverance should be a "peart" demand for "a chaw of terbacker." The closing lines of the poem seem to many persons irreverent. But we have heard a clergyman of unquestionable piety, who is himself an accomplished poet, say that he liked them better than any other part of the poem. They were coarse in expression, according to the refined notions of the East, but their meaning was sound and just. It was only the Pike-County way of expressing a truth, which no one would deny that angels occupied in saving little children were better employed than they would be if standing idle in heaven.—The new school, of which we have given the best specimens, is in a vein very easily worked, as is shown by the multitude of imitations that have already appeared. It has, however, the high merit of raciness, of intelligibility, and of being intensely American. Its chief danger is that it will come to an untimely end by the process expressively described in its own dialect as being "run into the ground."

—A writer in one of our weekly journals opens an article as follows: "The disciples of the late Mr. Buckle must have begun at least to doubt the prophetic character of their master from the signal contradiction which the facts of the last twenty years have given to his assertion that nations had grown too wise to go to war any more. The cheerful facility of that superficial philosopher in picking out and arranging his facts, and then drawing from them conclusions to suit himself, has ceased, we believe, to impose upon many minds; and the immortality of his fame as an historian has probably seen its best days." One of the difficulties usually occurring in an argument is to make your opponent state your position in the matter correctly. The author of the above sentences proves Buckle to have been a false prophet and a superficial philosopher by simply attributing to him sentiments that he never uttered. Mr. Buckle did not say, and we have examined his pages carefully to ascertain the facts in the case, that "nations have grown too wise to go to war any more." He simply, with almost unnecessary elaboration and anal-

ysis, argues that the war-spirit is on the decline; and he points out with absolute conclusiveness the different elements in modern society that are antagonistic to the spirit of war. Can anybody deny that war is looked upon in a very different light from what it was in the middle ages? Is not the very spirit with which the war between France and Prussia has been condemned by people everywhere, a proof of all that Buckle utters upon the subject? The writer from whom we have quoted seems to be unable to see a difference between a tendency and a consummation. Because war has just devastated one of the great civilized countries, he immediately assumes that all theories as to the decline of the spirit of warfare in the advance of civilization are false. In all social movements there are perturbations, and the critic is superficial who does not perceive this fact, not the philosopher whose generalizations are broad enough to reach beyond them.

— The *Worcester Spy*, one of the leading papers of Massachusetts, whose editor, Hon. J. D. Baldwin, for many years a member of Congress, is an eminent Sanscrit scholar, and author of a very learned work on Prehistoric Nations, speaks of the *JOURNAL* in terms which we are proud to quote. It says: "APPLETON'S *JOURNAL* is one of the best publications of the kind in the English language. It is edited with remarkable intelligence and good judgment, and each volume is a small library of miscellaneous reading—literary, historical, biographical, and scientific. There are sketches of travel and observation, illustrated descriptions of mechanical industry, and papers on art. Four volumes have been completed, and the first monthly part of the fifth volume has appeared. The bound volumes (handsome quartos of some eight hundred pages each, not including the supplements) contain a great amount of useful and entertaining matter, all specially prepared for this publication, and a great abundance of well-executed pictorial illustrations. Many of the pictorials are portraits. Beethoven, Thiers, Hawthorne, William Gilmore Simms, Von Moltke, Trochu, Max Müller, Ruskin, Barry Cornwall, and Charles Lever, are among those depicted in the fourth volume. Many of the illustrations are remarkably well conceived and very spirited: A series of articles entitled 'Picturesque America,' which was begun in the latter part of volume four, is continued in that which began with the present year. The publishers aim to make this series of illustrated papers attractive; and, as 'America' presents a wide field, it may become extensive. But the illustrations of American scenery are not confined to this series. In the volume just closed will be found illustrated sketches of scenery among the Adirondacks, around Seneca Lake, and in the Indian country. We may add that APPLETON'S *JOURNAL* is fit to have a place in any family where intelligence, good taste, and purity of mind, are encouraged."

— For many nights Mr. Edwin Forrest has been acting Lear before New-York audiences. This personation ought to be witnessed by all persons having a love for high art. When this veteran actor shall leave the

stage—an event that cannot be far distant—there will pass with him a grand method, of which he is now nearly the only representative. The whole tendency of the drama is now toward the simple and the realistic. Just as painters delight in cabinet *genre* pictures instead of the old historic canvases, our new actors have only taste and facility in the pretty trifles of French comedy. Those who attempt the higher ranges of the drama are, for the most part, but little imbued with the true histrionic dignity; they neither grasp so forcibly, delineate so clearly, nor illustrate so consummately, as the old masters of tragedy did. There is no one, for instance, on the stage now, excepting Forrest, who can at all personate a character like Lear. This splendid historic figure needs the massive method, the accurate elaboration, the careful study, the perfect knowledge of the art, of which Kemble, Siddons, and Kean, were exponents. Forrest is very far, indeed, from being an imitator of these distinguished actors, but he has a dramatic genius as powerful as theirs, and an art, like theirs, based on the most searching study. Two weeks since we spoke of an unjust prejudice entertained by many people against Forrest. He is wrongfully supposed by these persons to be representative solely of a loud and rude method of acting. Whoever sees his personation of Lear must admit the utter mistake of this supposition. We certainly prefer the quieter touches of his acting—gems often of rare beauty; but we doubt whether the severest critic would accuse his rendition of the choleric, inflammable, passionate old king as being in any wise too vehement. If there is vehemence in the powerful passages, there are marvellous pathos, rich and mellow repose, fine conceptions, apparent at every step. It seems to us the most perfect dramatic study now on the stage. It is very much to be regretted that Forrest gives Tate's stage-version of the play rather than the unaltered original, which Macready restored to the stage. It is stated that Mr. Forrest at one time contemplated adopting the true Shakespearian play, but for some reason he changed his mind, and has adhered to the old stage-version.

— One of two sisters, who for many years have sung pleasant strains of love, and beauty, and duty, has, in the fulness of fame, but with years too few, passed into a land which she believed closely bordered this. ALICE CARY is dead! Perhaps of all the poets of America whose rank has not been quite of the highest, Alice Cary has enjoyed the largest appreciation and the widest fame. Her poems have been, in the best sense of a term now become commonplace, household words. They have cheered, they have sweetened, they have refined, they have touched with quiet and subtle power, the hearts of thousands living in humble cottages, in the obscure by-ways of life. She probably came nearer to the sentiments and sympathies of the multitude than many of greater fame. She understood the level of the heart—the emotions, and tastes, and aspirations, and desires, and pleasures, of the pure and simple—even if she did not always reach the heights of art. Not that her skill was inferior to her power; the measure of her performance was always equal to

the measure of her conception. Very few have the highest flight, but then very few have the gaze to follow them. The average appreciation is kindled quicker by the grace, simplicity, and naturalness of a poet like Alice Cary, than by the more ambitious strains of others. It is a mistake, however, to make comparisons of this character. In Art as in Nature inferiority is in execution, not in measure; the violet is as admirable as the oak, the dove as the eagle. Alice Cary was a native of Ohio, the daughter of a farmer living near Cincinnati, and, with slender advantages of education, began early in life to contribute to the newspapers and magazines essays, sketches, and poems. In 1850 a volume of poems, the joint work of herself and her younger sister Phoebe, appeared in Philadelphia. In the same year, we believe, the sisters removed to this city, where they have ever since resided, esteemed and beloved by a wide circle of friends and acquaintances. Alice, in 1851, published a romantic poem entitled "Hualco," which was followed, the next year, by "Lyra, and other Poems," and by a new collection of poems in 1855. She published, under the title of "Clovernook," a series of sketches of Western life and scenery, and also four novels, "Hagar," "Married, not mated," "Hollywood," and "The Bishop's Son." She also published, in 1866, "Lyrics and Hymns;" in 1867, "The Lover's Diary;" and, still later, "Snow-Berries," a book for children. Many of her works have been reprinted in England, and have received there a cordial welcome. She was an occasional contributor to this journal, in which her last article, "The Great Secret," appeared in the number bearing date February 4th, only eight days before her death. She died on the morning of February 12th, after a long and painful illness, at fifty years of age.

Literary Notes.

PROFESSOR SEELEY has lectured before the Edinburgh Philosophical Institution on the qualities, characters, and works of Goethe. The substance of his address was as follows: "Realism was the first characteristic of Goethe; he was a realist in art, and his imagination had a vast fund of observation to work upon. What he wanted was a biographical subject, and with such subjects he was most at home when he had studied them at first hand. For that reason he liked best to describe himself, so much so that he had gone so far as to speak of the mass of his works as one great chapter of personal confession. His second characteristic was grace; no writer that ever lived had that gift in a more eminent degree. The third characteristic of Goethe, and one of perhaps greater importance than either of the others, was, that he possessed them both in perfection. There were, however, very striking and very distinct limitations to Goethe's intellect and power. He had ever an unconquerable aversion to mathematics, logic, and metaphysics. Professor Seeley was inclined to think that this aversion was due to the fact that those three sciences came under the category of abstract sciences; and Goethe's mind ever required to be arrested, in the first place at least, by the concrete. That state of mind might be, perhaps, expressed by saying

that Goethe was rather a sage than a philosopher."

John Esten Cooke's "Life of General Lee," which will soon appear from the press of D. Appleton & Co., is an elaborate biography, including an accurate but dramatic and picturesque history of those military transactions in Virginia of which General Lee was the distinguished leader. This "Life of General Lee" was commenced five years ago, in 1866, and the author then informed General Lee of his purpose. The general, in reply, assured him that the work "would not interfere with any that he might have in contemplation; he had not written a line of any work as yet, and might never do so, but, should he write a history of the campaigns of the Army of Northern Virginia, the proposed work would be rather an assistance than a hinderance." As Colonel Cooke, in his letter, had offered to discontinue the work, if not agreeable to General Lee, this reply is an obvious sanction of the author's design. It is prepared by a man of large literary experience, who served in the Virginia campaigns, and saw much of what he describes; and General Lee's sanction of his design arose from his knowledge of Colonel Cooke's peculiar fitness for the task. The general has died without executing his at one time contemplated labor; and this biography must, in a certain sense, fill the place, as regards the history of the Virginia campaigns, that Lee's own history would have done, had he lived to write it.

A critic who has read the advanced sheets of Darwin's "Descent of Man," says: "Whatever may be thought of Mr. Darwin's thesis, that man has arisen within the order of Nature, and by secondary causes, one thing is certain, he has produced a most fascinating book on life, and which will do more than any book has ever done before to create a kindly interest in the inferior orders of animate beings. A blow is given such as has never before been dealt to that false dignity of human nature which has no better basis than man's ignorant contempt of the creatures below him. I have never before had so sympathetic an interest in my neglected relations, the so-called brutes. Mr. Darwin has towed up the whole animal kingdom and anchored it in closer human neighborhood; and, if Mr. Bergh will turn colporteur for the diffusion of this book, he will be taking the most efficient means for securing the object he has at heart—the more Christian treatment of the dumb creatures which suffer so much from human brutality."

Judd's "Margaret" has been considered one of the most original and characteristic of American novels—a book thoroughly pervaded with the atmosphere of New-England life, and a perfect reflex of the idiosyncrasies and temperament of her people as they were exhibited in days before the Revolution. But the London *Saturday Review* pronounces it—incomprehensible! The same great authority disposes of a new edition of Walt Whitman's poems in this wise: "Mr. Walt Whitman publishes or republishes three volumes of what he calls poetry—probably because it is not prose."

A new uniform edition of the novels of Miss Yonge is now issuing from the press of D. Appleton & Co. "The Heir of Redclyffe" and "Heartsease" are ready, each volume accompanied with a new illustration, and the series bound in a unique and handsome style. Miss Yonge's novels still retain a share of the great popularity they enjoyed on their first appearance, and this new, tasteful edition is in re-

sponse to a demand for a uniform and satisfactory issue of her books.

Mr. St. George Mivart, an English naturalist, has just published a work entitled "Genesis of Species," which is an attempt to disprove the Darwinian theory. Here is an outline of the arguments which Mr. Mivart undertakes to substantiate:

That "Natural Selection" is incompetent to account for the incipient stages of useful structures.

That it does not harmonize with the coexistence of closely-similar structures of diverse origin.

That there are grounds for thinking that specific differences may be developed suddenly instead of gradually.

That the opinion that species have definite though very different limits to their variability is still tenable.

That certain fossil transitional forms are absent, which might have been expected to be present.

That some facts of geographical distribution supplement other difficulties.

That the objection drawn from the physiological difference between "species" and "races" still exists unrefuted.

That there are many remarkable phenomena in organic forms upon which "Natural Selection" throws no light whatever, but the explanations of which, if they could be attained, might throw light upon specific origination.

Francis Parkman, the eminent historian, has just issued a new edition of the earliest of his historical works, "The Conspiracy of Pontiac," which was first published about twenty years ago. It is regarded by the critics of England, as well as of this country, as one of the best of that series of powerful works in which the author has so vividly and yet so accurately portrayed the Indian life and character, and the French and English struggle for mastery in America. The new edition is enlarged and improved, and is made uniform in size with the other volumes of the series.

M. Ollivier, late Prime Minister of France, who has founded an asylum at Pollone, near Brelia, in Piedmont, is preparing for publication a work entitled "My Ministry of the Second of January." The first volume will bear the title "The Plébiacite," and the second "The War."

The name of Edwards seems to have recently multiplied oddly among English novelists, to the confusion, no doubt, of readers. Three English magazines now before us contain novels, by H. Sutherland Edwards, M. de Betham Edwards, author of "Dr. Jacob," and simply Mrs. Edwards, author of "Archie Lovell."

More than fifty million copies of "Webster's Spelling Book" have been sold, and the present rate of its production is about a million copies a year. More than two hundred and fifty thousand dollars have been paid to the family of Noah Webster, since his death, as copyright on his works.

Buchanan's poem, "Napoleon Fallen," has reached a second edition in London, and to this is added a supplement in the shape of a very fine war-song, written in parts. France entreating aid from England, and England expressing her bitter feeling at the moral degeneracy which prevents her from affording it.

D. Appleton & Co. have in press, and will shortly issue, "Musings over the 'Christian Year,' and 'Lyra Innocentium,' by Charlotte

Mary Yonge; together with a few Gleanings of Recollections of the Rev. John Keble, gathered by Several Friends."

Woman writers have multiplied in Russia during the past five years in a ratio equalled by no other country, and there are now eight hundred in the realm whom Prince Galitzin thinks worthy a place in the second edition of his "List of Russian Authoresses."

The *Athenæum* says that among the unknown curiosities in the British Museum are some cases bequeathed by Francis Douce, the well-known literary antiquary, on the condition that they are not to be opened till the year 1900. No one is aware of their contents.

The first of three octavo volumes on "John Wesley, his Life and Times," written by Rev. Luke Tyerman, has just been published in England.

In the five largest libraries in Paris are contained one million four hundred and fifty thousand volumes and eighty-seven thousand manuscripts.

Mrs. Hines's little volume of poems, which was issued about six years ago, and attracted some attention at the time, is again on sale, and will commend itself to those who like graceful and delicate poetry.

A new periodical, *The Ferret*, described as "a journal of humor," has made its appearance at Swansea, in South Wales. "Five numbers have reached us," says the *Pull Mall Gazette*, "but the humor has yet to come."

With a view to promote newspaper production, the Government of Peru has issued a decree exempting printers from service in the National Guard.

Dante's "Divina Commedia" is now being translated into Roumanian by the Roumanian poet I. Eliades Radulescos.

"Diary of the French Campaigns," and "Historical Diary of the War," have been reprinted in London from the German.

"Ginx's Baby," of which we gave a summary in our Table-Talk last week, has been reprinted in New York by Routledge & Co.

Bret Harte's stories are pronounced too rude for English readers.

An Englishman has written and published an "Ornithology of Shakespeare."

The Chinese at North Adams, Massachusetts, have been presented with Chinese Bibles

Scientific Notes.

PROFESSOR TRUMAN H. SAFFORD, who, in his boyhood, was famous as "the young Vermont mathematician," is now director of the Observatory of the University of Chicago, and has a high reputation as an astronomer. He lately read the following paper, at a meeting in Chicago, in which he gives a clear and concise view of the most recent researches on the sun, and on the nature of heat, and also some indications of the position which the sun holds in the philosophy of Swedenborg, in which Professor Safford is a believer:

"We are taught, in the writings of the Church, that the sun corresponds to the Lord; its heat to His love; its light to His wisdom; that it is the mediate instrument of our natural life by the life which it receives from Him, and images, on the natural plane, His constant good-

ness toward us. We learn also, in the writings of the Church, many other things which indicate the principle of a true philosophy with regard to the sun; so true a philosophy, indeed, that it comprehends the great laws which the science of the present day is toiling to prove in detail and in ultimates. If we imagine ourselves in the other world, we shall see high above us, in a middle altitude, the sun of heaven; the divine proceeding from the Lord; the outflow of His infinite life. Its heat is His love, poured down upon angels and spirits, and becoming their love and life. Its light is His wisdom, which enables them to see things about them, and thus to see what He creates in that world, and the laws of such creation. The spiritual sun reaches every thing in the universe by its heat and its light, and by the atmospheres surrounding it. The earth in the spiritual world is real and substantial. It has hills and valleys, rivers and streams, green fields and great cities. Its air is clearer and purer than the bluest sky of this world; its climate more temperate than the most favored regions here. Its inhabitants are angels and good spirits, instead of men, and enjoy, proportional to their goodness, happiness both in external manifestations and surroundings, and in the inward peace to which the lovely world about them corresponds. The source of all the externals of the other world—the Sun of heaven—operates as does the sun of this world, but in a living, divine, original manner. Our sun itself is but a dead image of that; but so correct an image that from it we may learn much about the Lord, or rather, confirm much which is revealed to us. Thus that Sun is most intensely active; and we can hardly picture to ourselves any more distinct representation of its activity than the glowing lake of fire which warms and lights us at so great a distance. The later discoveries of science have told us much about the intense motions in our sun. Its body is supposed to be liquid, in continual agitation, surrounded by an atmosphere of glowing vapor. Every now and then some portion of this atmosphere becomes less intensely heated than the rest, and forms what seems to us a dark spot, even approaching blackness, but which really is as a white heat, shown dark by contrast only. Outside the great body of the solar atmosphere are the brilliant red protuberances, seen at total eclipses, and lately by new instruments at any time, which are also glowing, hot, and fiery, and in constant agitation, undergoing enormous changes, extending over thousands of miles, in a few minutes. Among these fiery clouds, as we may call them, are known to be contained many substances like those on the earth, but glowing as vapor. Among these are sodium, iron, copper, and probably gold. We can hardly imagine how hot it must be, not only to melt, but vaporize these substances, and how enormous must be the activity of the forces indicated by the rapid motions of the solar atmosphere. The spots upon the sun change in figure and form very rapidly. Some of them are thousands of miles in diameter, and are formed in a day or two; and every ten years there seems to be a period of unusual activity in their formation. The present year is one of those periods, so that, whenever the sun is looked at, we may expect to find large spots upon it. Now it has been observed that the influence of this change in the spots extends to the earth, and affects the magnetic needle, which, during this year, may be expected to be unusually disturbed. The sun images the Lord, then, by its intense activity continually operating, by its immensity, representing his infinity. It again corresponds to Him in the stream of energy and life, as it were, it continually pours forth out of itself into

the bodies which surround it; energy which, when it reaches the earth, becomes useful to every creature. The Lord's life, which proceeds from Him to angels and men, is His love and wisdom, which in turn becomes their love, their wisdom, and their life. So the sun's heat and light become, on the earth, sensible heat and light, or force, which, equally with heat and light, is a part of the phenomena of animal life. Force or power we become conscious of when we do any thing with our hands, or when we walk from place to place. The physical part of force is now thought, by scientific men, to be certainly the same thing as heat. The solar heat, falling upon the earth, is taken up partly into the atmosphere, causing winds; partly into the water, causing vapor, clouds, and rain; partly into animals and vegetables, making them grow. The winds give us power by wind-mills, or sails of ships. The rain falls on high places, and runs into brooks and rivers, thus supplying water-power. The vegetable kingdom furnishes wood and coal, the food of the steam-engine; or grain and hay, to feed animals and men. In a word, if we need power of any kind, we must go directly or indirectly to something which received it as heat from the sun. 'All the world's work, with the one trifling exception—the work done by the tides,' says a scientific writer of high repute, 'is done by the sun.' Still more than this, there is but little doubt that what we call heat is really motion. Sound is composed of waves in the air, which impinge on the ear; light, of waves in the ether, which strike the eye; and heat is so closely allied with light, that it must be something of the same kind. This ether is an extremely thin atmosphere, the finest of all fluids. It can carry light, but not be seen; can carry heat, but not be felt. It is probably necessary as a means of holding solid bodies together, though itself of the most delicate consistency. Numberless little waves of this fluid reach the eye, and, by their variegated forms, make us see every thing that we can see, though they may have started years ago from a distant star. This ether penetrates every thing without obstruction, and without it all matter would most likely dissolve into atoms. Heat, also, is composed of similar waves of this ether. When they reach an object, they heat it and set its particles into motion. If the heat reaches the finger, for instance, the motion may be so rapid as to cause extreme pain, or finally destroy the finger itself. Solid bodies can be melted, and even vaporized, by a sufficiently rapid and numerous series of these waves of the ether; in other words, by a sufficient amount of heat applied to them. In this character of heat, as a most subtle force exerted in the inmost and most delicate part of Nature, in a most deeply-hidden manner, and yet so powerfully that nothing can withstand it, we see again an image of the heavenly Sun, and its operations upon the soul. Heat is not simply something which can be felt, but is an activity of the most powerful kind. The Lord's love is not simply something to be felt, but something which is to become our life. The great storms in the natural sun, the spots, and other phenomena in its atmosphere, are now more and more regarded as effects of something deeper. There was a time when it was thought that the outside atmosphere of the sun gave light and heat; that the interior was a dark body like an earth, and the spots were openings in the bright clouds of the atmosphere, showing behind them the dark body. Some speculated that the sun might be inhabited, others that it was heaven. But nowadays it is beginning to be admitted that the sun's heat and light proceed from the depths of its body, and that they cause the spots and other

phenomena. That the sun does the world's work, is generally believed among scientific men; and it is also pretty generally thought that the earth was formed from the sun. There are many reasons for this view, which I cannot well detail here; the chief reasons being that the sun and planets have what I may call a strong family resemblance, in many features not involving the giving out of heat and light, but more related to their various motions. It will, I think, be sufficient to recapitulate the points in which the philosophy of the Church is confirmed by modern science in points relating to the sun: 1. The earth was probably formed from the sun, and performs its work by the sun's help. 2. The sun is itself not a dark body with bright atmospheres, but glowing and fiery interiorly, and contains within itself many of the substances, in principle at least, which exist here. 3. All force known, which can be used by man to do work with, gets its physical part directly or indirectly from the sun. 4. The activity of the sun is most intense and immense, and pervades the whole solar system, while at the same time it is most subtle and interior. 5. The atmospheres of the sun are the media of its activity and usefulness toward the earth and its inhabitants."

Miscellany.

Carrier-Pigeons.

IT is generally supposed by the uninitiated that the "carrier"-pigeon, so called by fanciers, is the bird especially selected for carrying messages. Now, a highly-bred "carrier" would be no more fitted to convey a dispatch from one place to another at a rapid rate than a brewer's dray-horse would be calculated to win the Derby. The birds bred for, and employed upon, this special service of letter-carrying and rapid flying are known as "Antwerps," "Homing birds," "*Les Pigeons Voyageurs*," etc. They possess great breadth and power of wing, while the breast-bone is strongly developed, giving ample room for muscular attachment. In 1865 a race was flown from Liverpool to Ghent, a distance as the crow flies of about three hundred miles, and the pigeons, thirty in number, were started at half-past five in the morning. Some of them reached Ghent about six that same evening, while others did not arrive until eight; and eight out of the thirty birds which were started never arrived at all. This gives a rough average for the fastest flyers of about twenty-five miles an hour. But, according to the statements published as to the speed at which the distance between Bordeaux and Liege is traversed by highly-trained birds, the rate of progress is considerably more, the five hundred miles being accomplished in something like twelve hours. Not long ago two celebrated pigeons were flown from the centre arch on London Bridge to their cotes in Chelsea, a distance in a straight line of about four miles. A stiff westerly breeze was blowing at the time the birds started. One reached its "cote" in nine minutes and fifteen seconds, the other in six minutes and forty-five seconds. The pigeons were not started together, but about fifteen minutes apart. The first remained in sight thirty-five seconds, the second twenty-eight seconds. These "homing birds" are regularly trained by taking them, while young, short distances from home, and letting them return, the distances being gradually increased from time to time, until they are perfect at their work. The direction in which they are taken is likewise constantly varied. There are two plans for fastening the dispatch-

es to the birds intended to carry them. The one, to write the message in cipher or some very abbreviated system of communication on a slip of very thin vellum, then to wind this slip around the bare part of the bird's leg neatly and firmly, fastening it at the finish with fine sewing-silk. Another, and by far the better plan, is to wind the slip containing the message around the centre tail-feather, or, rolling up the slip, fastening it firmly to the feather by means of fine silk. The centre tail-feather has this great advantage: it does not materially alter its position when the bird spreads its tail during flight, or when it folds it during the period of rest. Other feathers of the tail are frequently stamped with the time of departure, number of the bird, or other matters of interest or importance. No one would ever dream of attaching a letter to a pigeon beneath its wing or round its neck.

War versus Civilization.

It may be asked, indeed, with only too much force, what is the use of lamenting over the horrors of war? It is a very old story; war is, and always will be, a very ugly thing when stripped of its covering of romance; and to insist upon one more proof of its ugliness is not a very profitable expenditure of human energy. The Quaker doctrine cannot yet be applied to international relations. Everybody, with some few exceptions, will admit that, under many circumstances, it would be our duty to go to war in order to preserve the respect for treaties or the independence of an oppressed nation. We admit that there are greater evils than those which we are lamenting, and diseases which require this tremendous surgery. To denounce war purely and simply means nothing but that we are to allow brute force to have its own way in the world. Weeping and wringing of hands over bloodshed and outrage is, indeed, futile enough, unless it is a preface to some practical substitute for our present mode of settling disputes. The process now taking place, revolting as it appears to bystanders, is, on the whole, the only plan hitherto devised by which certain problems, which must be solved in one way or another, can get themselves thoroughly worked out. Yet it is perhaps worth while to insist occasionally on the extremely unsatisfactory nature of the system, in order to stimulate our anxiety to discover some efficient substitute; and still more to throw discredit upon those erroneous theories and evil passions which must inevitably lead to war. For it is a most disagreeable reflection that, until that change has been effected, the tendency of improved civilization is obviously to make wars more horrible than of old. The nearer men are brought together, the more intimately they are dependent upon each other's services, and the greater the power given by improved methods of organization for bringing the whole strength of a nation to bear upon a given point, the more serious will be the injuries inflicted, and the more bitter the animosities generated. It is frequently remarked that the extension of military service from a purely military class to a whole people is a retrograde step. In one sense it may be so; but it is only a natural consequence of all those complex changes which have made the union between different parts of a country far closer than was the case in former times. Telegraphs and railways are the instruments and material symbols of the social and intellectual forces which are steadily binding us more closely together, and iron-clads and cannon of the occasional dangers produced by the approximation. The embittered character of the present contest is a proof that the development

of our social machinery has proceeded much more rapidly than the development of the feelings which should correspond to it. We have come incomparably nearer to each other without learning to like each other much better than before, and the natural consequence is a terrible explosion which does more mischief in a month than a steady, respectable old war used to do in a year. It is the more necessary to insist in due season upon the dangers thus fearfully illustrated, and likely to become more serious as time goes on. War will not be put down by simply denouncing it, for it is a symptom of a profound want of adaptation of our present society to the conditions in which it is placed; but such denunciations may not be quite worthless if they call attention to the importance of removing the causes of so horrible a system.

A London Fog.

Every thing was wrapped, as it were, in a veil of brown holland; our elegant statues, our superior public buildings, were all hidden from view. The 'buses moved slowly as ships in a Channel mist, and were invisible until within so short a distance that their huge bulk seemed about to crush and topple on the foot-passenger. The reckless cabman, for a wonder, was tamed. The fog was too much for him. He was afraid to venture upon his customary rushes, and might be seen cautiously feeling his way, as though afraid of the police, and occasionally so helplessly adrift that he was compelled to seek the aid of the link-boys. The fog sadly interfered with the pride and pomp of the lord-mayor's show as it advanced westward. It is hard even for a mounted farrier to look imposing enveloped in a brumous mist, and the banners and carriages made a blurred, washed-out spectacle from the foot-path as the procession appeared to dissolve into dirty yellow smoke. Billows of fog rolled up the Thames, which was literally a silent highway; barges and steamers lay idle; and the noise of the traffic on the bridges came to the ear with a dull, muffled sound, while the bridges themselves only loomed into sight when for a moment a cold, damp gust would cause the curtain of vapor to move aside.

The chemical constituents of the London fog must be of the most irritating character. The fog affects the eyelids, tickles the throat, and, taken into the lungs, brings on a fit of coughing. It puts a deposit of those minute particles known as blacks on the face. It is greasy and palpable, and wonderfully penetrative. It is exceedingly difficult to bar it out. Into a room of any size it is sure to get and to take up its quarters for the period of the foggy visitation. It hangs on the landings and in the hall. From the window you gaze into fog, and, when you turn to look to your bookshelves, you find that the fog has obscured their range of friendly contents. The mode in which a fog enters and takes complete possession of the larger theatres is picturesque if not agreeable, or conducive to the comfort of the audience, or of the performers. The gasaliers are murky; the gods, or the regions where the gods were wont to be, are as obscured as the peak of Skiddaw in heavy weather. Coughing sets in in the stalls at an early hour, and continues until the close of the last farce.

Different Ways of making Tea.

The Chinaman puts his tea in a cup, pours hot water upon it, and drinks the infusion off the leaves; he never dreams of spoiling its flavor with sugar or cream. The Japanese triturates the leaves before putting them into the pot. In Morocco they put green tea, a lit-

tle tansy, and a great deal of sugar, into a teapot, and fill up with boiling water. In Bokhara every man carries a small bag of tea about him, a certain quantity of which he hands over to the booth-keeper he patronizes, who concocts the beverage for him. The Bokhariot finds it as difficult to pass a tea-booth as our own dram-drinker does to go by a gin-palace. His breakfast beverage is Schitschaj, that is, tea flavored with milk, cream, or mutton-fat, in which bread is soaked. During the daytime, sugarless green tea is drunk with the accompaniment of cakes of flour and mutton-suet. It is considered an inexcusable breach of manners to cool the hot cup of tea with the breath; but the difficulty is overcome by supporting the right elbow in the left hand and giving a circular movement to the cup. How long each kind of tea takes to draw, is calculated to the second; and when the can is emptied, it is passed round among the company for each tea-drinker to take up as many leaves as can be held between the thumb and finger—the leaves being esteemed an especial dainty.

When Mr. Bell was travelling in Asiatic Russia, he had to claim the hospitality of the Buratsky Arabs. The mistress of the tent, placing a large kettle on the fire, wiped it carefully with a horse's tail, filled it with water, and threw in some coarse tea and a little salt. When this was near boiling-point, she tossed the tea about with a brass ladle until the liquor became very brown, and then it was poured off into another vessel. Cleansing the kettle as before, the woman set it again on the fire, in order to fry a paste of meal and fresh butter. Upon this the tea and some thick cream were then poured, the ladle put into requisition, and, after a time, the whole taken off the fire and set aside to cool. Half-pint wooden mugs were handed round, and the tea ladled into them, a tea forming meat and drink, and satisfying both hunger and thirst. However made, tea is a blessed invention for the weary traveller.

I wish he would decide.

I wish he would decide, mamma,
I wish he would decide;
I've been a bridesmaid twenty times—
When shall I be a bride?
My cousin Anne, my sister Fan,
The nuptial-knot have tied;
Yet come what will, I'm single still—
I wish he would decide.
He takes me to the play, mamma,
He brings me pretty books,
He woos me with his eyes, mamma,
Such speechless things he looks!
Where'er I roam—abroad, at home—
He lingers by my side;
Yet come what will, I'm single still—
I wish he would decide
I throw out many hints, mamma,
I speak of other beaux,
I talk about domestic life,
And sing "They don't propose;"
But ah! how vain each piteous strain,
His wavering heart to guide,
Do what I will, I'm single still—
I wish he would decide!

French Character.

The extraordinary race by which France is inhabited appear to be richly, nay supremely, endowed with every gift but one—the gift of true political sagacity. Hence it is that, while they are the greatest framers of logical processes and the most prolific parents of abstract ideas for the solution of all manner of problems, they seem to show in their own case little practical tact available for the management of human affairs. In every other race of excellence they

commonly conquer or vie with the foremost of European nations; in national self-knowledge they seem to be behind the hindmost. France does not know, and cannot discover, how to constitute herself. Gifted with great administrative faculties, her people have now, for nearly a hundred years, exhibited a woful incapacity for adapting their institutions to their wants, or for imparting to them a character of durability.

No French constitution lives through the term of a very moderate farm-lease. The series of perpetual change is not progression; it is hardly even rotation, for in rotation we know what part of the wheel will next come round, whereas the French polity of to-day in no degree enables us to judge what will be the French polity of to-morrow. Accomplished and consummate in the branches of an almost universal knowledge, in this single but great chapter of the appliances of civilized, not to say human life, they have yet to learn their A B C. What might France not be if, instead of allowing her mouth sometimes to water for the annexation of Belgium, she could import from beyond her northern frontier the political common-sense which makes that small country one of the best governed and most respected members of the European system? With this crudeness, changefulness, and barrenness in point of achieved political results, France becomes before all things a calamity to herself, but she becomes also of necessity a standing cause of unrest to Europe.

Our Two Great Libraries.

The librarian of Congress reports the number of volumes now in the library as one hundred and ninety-seven thousand six hundred and sixty-eight, an increase of twelve thousand four hundred and sixty-one from last year. As to the Astor Library, the report of the trustees shows that the books now number one hundred and forty thousand five hundred and fifty-eight, an increase of fourteen hundred and fifty-three in 1870, and that the finances are in a healthful condition. The number of books read in the course of the year in the halls of the library, is given as seventy-eight thousand nine hundred and ninety-five; and, from a carefully-drawn statement, it appears that British literature, excluding novels, was the topic most favored by readers, then theology and ecclesiastical literature, then American history, and then commerce and the useful arts, novels forming but a trifle over seven per cent. of the works read. Jurisprudence, which one would think likely to make a prominent study, appears to have but little the advantage of heraldry and genealogy, of all themes in this work-a-day age. But, no doubt, there is a vein of romance in us all, apt to linger over crests and blazonry, family mottoes, and long-descended coats-of-arms. One little circumstance evidenced in this report may serve to evince the special utility of the Astor Library; being this, that, of some five thousand two hundred and fourteen permitted to the privilege of the alcoves, no fewer than twenty-three hundred and thirty-four, or very nearly half, were busied with works on inventions, theology, and the fine arts.

Varieties.

THE scene described below is said to have taken place in the Kentucky Legislature in the winter of 1867: A member of one of the mountain-counties was a persistent reader of the *Louisville Journal*, and each morning, as the House opened, would commence reading his favorite paper. About the same moment some member would move to dispense with the reading of the journal, and our mountain-

member would lay down his paper. He stood this for some time, but one morning, rising from his seat after the usual motion, he exclaimed, at the top of his voice: "Mr. Speaker, I've sot here for morn'n a week and submitted to the tyranny of this House. Somebody every morning moves to dispense with the reading of the journal, and I've lost every paper I've bought for a week by it; and no man has ever moved to dispense with the *Democrat* or *Courier*; and, Mr. Speaker, I won't stand it any longer. Mr. Speaker—" Here the remainder was lost in the general laughter.

A few days after Charles Dickens's death one of his countrymen, an enthusiastic admirer of the great novelist, made a pilgrimage to the shrine of Gadshill. After feasting his spirit on the scene before him, and indulging freely in the luxury of woe, the flesh began to assert its claims, and the enthusiast repaired to the famous hostelry, the Sir John Falstaff, hard by. Every one knows how wretched it is when one's emotions are too much for one not to be able to pour them out into a sympathetic ear; and, so sensible was this "man of feeling" of his desolation in this respect, that, for want of any one better, he took the waiter into confidence. "Sad loss this of Mr. Dickens," said, in mournful tones, the sentimental traveller. "Sad loss to us, sir, indeed," was the emphatic reply; "ad all his ale from this 'ouse, sir." The conversation was not continued.

One of the results of the German Arctic exploring expedition is the discovery of immense coal-beds in the north of Greenland. Mountains exceeding Mont Blanc in height were discovered, and the botanical specimens found indicate that Greenland must have been covered at one time with a rich vegetation.

The following rules for the government of children, which were first presented in one of Mr. Jacob Abbott's books, have been of great service to many successful teachers: "When you consent, consent cordially. When you refuse, refuse finally. When you punish, punish good-naturedly. Commend often. Never scold."

An advertisement was lately sent to the office of the *Cleveland Herald*, in which the words: "The Christian's Dream: no Cross, no Crown," occurred. The compositor made it read: "The Christian's Dream: no Cows, no Cream."

King William, on being asked what he thought was the most wonderful thing in Versailles, replied by quoting the words of the Doge of Genoa to Louis XIV. "*C'est de m'y voir.*" (It is to find myself here.)

Josh Billings observes: "Sekrets are poor property enny how; if yu circulate them yu loze them, and if yu keep them yu loze the interest on the investment."

"Do you think that raw oysters are healthy?" asked a lady of her physician. "Yes," he replied; "I never knew one to complain of being out of health in my life."

As many as twelve French dukes, of the oldest and most distinguished lineage, have been killed or seriously wounded during the present war.

A little boy, returning from Sabbath-school, said to his mother: "This cat-e-chism is too hard. Ain't there any kitty-chism for little boys?"

The Cincinnati *Commercial* warns Englishmen to pronounce General Schenck's name "Skenk."

The Chicago City Directory for 1870-'71 contains the names of nine hundred and fifty-seven Smiths.

Warning to bald heads—"Death loves a shining mark."

It makes a great difference whether glasses are used over or under the nose.

When is the weather like a crockery-shop? When it's muggy.

It is a somewhat curious fact that a compositor takes most *e's* when hardest at work.

New reading—None but the brave dispute the fare!

The Museum.

OUR ideal geological illustration, this week, is an endeavor to represent the remarkable Edentates—the *Glyptodon*, the gigantic *Megatherium*, and the *Mylodon*, which inhabited America during the Quaternary epoch. The order of edentates is more particularly characterized by the absence of teeth in the forepart of the mouth. The armadillo, ant-eater, and pangolin, are the living examples of the order. These animals had largely-developed claws at the extremity of what resembled hoofs, and seem to have been a link between hoofed mammals and the ungulated animals, or those armed with claws.

The glyptodon belonged to the family of armadillos. A hard, scaly shell, composed of numerous segments, covered the entire upper surface of the animal from head to tail. It had sixteen teeth in each jaw, channelled laterally with two broad and deep grooves, which divided the surface of the molars into three parts—hence its name of glyptodon. The hind-feet were broad and massive, designed to support a vast incumbent mass. Specimens have been found nine feet in length. Its habitat was the banks of rivers in Buenos Ayres.

The megatherium, or animal of Paraguay, as it is sometimes called, was an extraordinary creature. Its place is between the sloths and the ant-eaters. Like the first, it fed on leaves of trees; like the latter, it burrowed deep in the soil, finding there shelter, and food on the roots of trees. It was as large as an ordinary elephant—its body measuring thirteen feet in length, and between five and six feet in height. It possessed an enormous tail, not less than two feet in diameter, which it probably used as an aid in supporting the great weight of its body, as well as a formidable weapon of attack or defence. Supported on its hind-feet and tail, it could use its fore-feet as powerful implements for excavating the earth. It had the head and shoulders of the sloth, the feet and legs combined of the ant-eaters and sloths. With its massive proportions it could neither creep nor run, but only walk with a very slow and tedious movement. Complete skeletons of this animal have been found in the bed of the river Salada, which runs through the pampas to the south of Buenos Ayres.

Like the megatherium, the mylodon closely resembled the sloth. Smaller than the megatherium, it differed from it chiefly in the forms of the teeth. Those organs presented only molars with smooth surfaces, indicating that the animal fed on vegetables, probably the leaves and tender buds of trees. With the great tail and huge hind-feet fixed on the ground this creature could freely exert the full force of its powerful arms and great claws in pulling down branches of trees in order to reach their leaves. The edentates are found in America alone.

In consequence of some hints given by President Washington, Mr. Jefferson discovered, in a cavern of Western Virginia, the bones of a species of gigantic sloth, which he supposed to be the remains of some carnivorous animal. They consisted of a femur, a humerus, an ulna, and three claws, with half a dozen other bones of the foot, forming the remains of a species of gigantic sloth, the complete skeleton of which was subsequently discovered in the Mississippi, in such a perfect state of preservation that the cartilages, still adhering to the bones, were not decomposed. Jefferson called this species the *Megalonyx*. It resembled, in many respects, the sloth. Its size was that of the largest ox; the muzzle was pointed; the jaws armed with cylindrical teeth; the anterior limbs much

longer than the posterior; the articulation of the foot oblique to the leg; two great toes, short, armed with long and very powerful

claws; the index-finger more slender, and armed also with a less powerful claw; the tail strong and solid: such were the salient

points of the organization of the megalonyx, whose form was a little slighter than that of the megatherium.

A NEW AMERICAN NOVEL!

Will be commenced in number 103 (March 18th) of

APPLETONS' JOURNAL,

A New Novel of American Life,

ENTITLED

"MORTON HOUSE."

By CHRISTIAN REID,

AUTHOR OF "VALERIE AYLMEYER"

"Valerie Aylmer" was pronounced, on its appearance last summer, "one of the best of American novels." "The descriptive power—the word-painting power of the author," said a distinguished critic, "is very great." "Morton House" is a story of Southern life, of thirty years ago, and will be found to possess remarkable interest and power.

It will appear serially in each number of APPLETONS' JOURNAL; until completed.

D. APPLETON & CO., Publishers, New York.

REMOVAL.

Messrs. D. APPLETON & CO. announce the removal of their business to the new, spacious, and elegant building, Nos. 549 & 551 BROADWAY, NEAR PRINCE STREET.

Messrs. APPLETON & Co. invite the attention of book-buyers to their extensive stock of standard books, selected with special view to the wants of book-collectors, which gentlemen are solicited to call and examine. Orders for private or public libraries filled with care, and on liberal terms. Their stock of new standard and miscellaneous books, for the wholesale trade, is extensive, and the attention of dealers is invited to it.

Messrs. APPLETON & Co. also announce that a STATIONERY branch is attached to their business, for supplying, both at wholesale and retail, every variety of American and Foreign Stationery. Especial attention is given to the manufacture of blank-books, to commercial printing, and to engraving wedding and visiting cards, monograms, crests, etc. Merchants and others are invited to inspect their stock.

APPLETONS' JOURNAL

OF LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 103.—VOL. V.]

SATURDAY, MARCH 18, 1871.

{ PRICE TEN CENTS.
{ WITH SUPPLEMENT.

NEW-YORK HOUSE OF REFUGE.

VERY little even the old citizens of the city of New York know of the daily reformatory work going on within the halls and walls of the two imposing structures, with their lofty domes, standing upon the highly-cultivated grounds forming the southern extremity of Randall's Island. Strangers from over the seas visit the House of Refuge, embodied in these fine and well-arranged buildings, and carry away with them the most favorable impressions. As early as 1832, seven years after its establishment, when the institution was poorly accommodated in the stone barracks, which old residents of the upper part of the city will readily call to mind as standing at the junction of the Bloomingdale and Old Post Roads, now a portion of Madison Square, De Tocqueville and Beaumont, French

HOUSE OF REFUGE ON RANDALL'S ISLAND.

counsellors and special prison-commissioners, carefully examined its form of discipline, and made an elaborate and favorable report upon it to the French Government. In 1839 another French jurist, whose name has become identified since with the question of juvenile reform, Judge de Metz, received an inspiration from an examination of its reformatory processes, which induced him to devote the remainder of his life to the redemption of the young criminals and the exposed youth of his country. The great institution—a little village by itself—at Mettray, four miles from Tours, with its six or

seven hundred *détenus*, stands now—unless the Prussians have burned it—as the monument of his intelligence and patriotic charity. The *Reformatory and Refuge Journal*, published in London, has presented

FRONT GROUNDS.

NORTH LAWN.

to its readers several particularly appreciative letters from its English correspondents, visiting our city, who had been greatly impressed by the admirable accommodations and the efficient industrial discipline of the House of Refuge; and there lies before us, as we write, a two-columned letter to a leading provincial paper, published in *St. John's*, prepared by a cultivated Scotch clergyman familiar with the British measures and institutions for reform, expressing the highest satisfaction with the result of his personal examination of the New-York establishment.

To many, if not the majority, of our city readers, its walls are simply the enclosures of a juvenile prison, and the young persons within them are only thought of as objects of unmingled pity. They can hardly ima-

gine that young life flows on here with scarcely a consciousness of restraint, and expresses its vitality and genuine joyousness in almost every possible form of youthful sport and hilarity. They think of its officers simply as jail-keepers, and do not dream of the strong family-tie binding the children to their governors and teachers, and opening the hearts of the latter with the tenderest interest in behalf of their young charges. The inmates of the Refuge, after an absence of a few years, visit their old home with the enthusiasm of returning children, and fall upon the arms of their teachers often with the warmth of a long-absent youth coming into the presence of a beloved mother. Incidents full of romance, as they are sometimes the actual foundation of it, are constantly occurring. The hero of Melville's South-Sea fictions—"Omoo" and "Typee"—was a boy of the Refuge, and is still living. He is now a worthy member of the Episcopal Church in a New-Jersey city. With his rector, he lately dined at the House. He went from the Refuge, forty years ago, upon a whaling-voyage, rose to the second office on shipboard, and was for many years, through sickness at first, a resident, high in office, in one of the Society Islands. He will carry to the grave with him the mar-

vellous tattooing that covers his body. He relates, with great unction, the strange incidents in his eventful life, which the hand and brain of the novelist have woven into such entertaining pictures. When he returned from his long banishment, whither should he go but to one of his old managers, Hon. Hugh Maxwell, then United States collector? By him he was introduced to another worthy New-Yorker, Peter Cooper, and is to this day in his employment. The history of his

neglected boyhood, is it not fully written among the chronicles of the inmates of the House of Refuge?

The Sabbath before this paper was written, a wedding occurred at the chaplain's residence—the pleasant brown cottage standing in the shadow of the Refuge buildings. A young Swede, without proper guardianship, fell into the vices and petty crimes of our street-boys, and became as hard and apparently hopeless as any of his associates.

After spending some months at the Refuge, he ran away. He was afterward heard of in the Penitentiary. A wound, received in a street-brawl, sent him to the Charity Hospital. Then he came to himself! He remembered his friends and his opportunities at the Refuge. He wrote a touch-

ing letter to the superintendent, asking the privilege of coming back of his own accord and trying its discipline over again. Back he came, closing with his own hand its door upon his departure, except by the consent of its officers. An opportunity was afforded him to complete a branch of the shoemaking trade, to earn, while an inmate of the House, enough to fit him out with a suit of clothes and to pay his board a short period in advance. Then, having secured a decent boarding-place in the upper part of the city, remunerative work was given him, as it is offered to others of this class, by the institution contractor, and every day found him regularly at his bench. During the period of his connection with the House, a girl from a western city in the State was enjoying the instruction of the Refuge in the female department. There was occasion enough for her committal, and very slight hopes were indulged by her friends of her ever becoming such a person as they could welcome again to their homes.

She awakened the interest of her teachers, and, after months of instruction, gave encouraging evidences that a womanly modesty and a penitent purpose to live a new life had been awakened. After her discharge from the Refuge, finding herself for a time

out of place, and at loss at the moment which way to look for another, she turned her steps toward her old home. As she approached the ferry, her courage failed her. She had not fully met the reasonable expectations of her friends at the Refuge. Would they receive her? She was just about to return and bury herself among the unhappy frequenters of the streets, when the boat bringing across from the island the workmen from their daily tasks, touched the wharf, having on board, among

PLAY-GROUND, FIRST DIVISION.

PLAY-GROUND, SECOND DIVISION.

others, our young Swede. She had seen him, as he had visited the chapel often after his discharge, and she knew his story. He also recognized the young woman, and soon drew out her purpose from her. He dissuaded her from returning to the city, and offered to find her a boarding-house and a place for service. The offer was accepted. After two or three months' acquaintance, in the presence of the brother of the girl, a young man of fine character and in good circumstances, who had satisfied himself as to the habits and prospects of both parties, and cordially consented to the union, promising them all needed aid hereafter, they were married by the chaplain of the institution.

The House receives boys, not from the city only, but from Long and Staten Islands, and from the river counties of the whole State. The girls' house—a very convenient and pleasant edifice—with its separate school-rooms and playgrounds, can accommodate two hundred and fifty. It is the only State institution for girls, in New York, but it has never been full. It has now less than one hundred inmates. Young girls who are falling into temptation, or exposed to it in various portions of the State, are often permitted to go on in a downward career until their vices or crimes become openly manifest, and then they are sent to the county-jail or almshouse, or are permitted to run away to some large town or city, to keep up the supply of abandoned women. The expense of sending a girl from a distant county to the Refuge is made the common excuse for permitting a perilled child to go on to certain ruin without interference. Hundreds of girls, snatched from the jaws of moral death, are now scattered over the

FOUNTAIN.

There is a marvellous difference in the early social condition of the youth reaching the Refuge. Here are little parentless boys and girls, the vagrants of the streets, guilty of petty thieving, with little sense of wrong-doing, through lack of instruction. Here are small lads from very decent families, who have been drawn into thievish habits by their street companions. Here are boys and girls whose parents are church-members and well-to-do in worldly affairs, who were, when they came, the helpless slaves of a monomaniacal habit of theft, or an appetite for stimulants, or for sexual indulgence. And here are older boys and girls than are found in any other houses of refuge in the country—youths who have become familiar with a vicious or criminal life, and whose only hope of redemption turns upon the efficiency of the Refuge discipline. By the admirable arrangements of the House, the older and criminal classes are separated from the younger and vagrant. Homes are early found for the latter, where they will have the best and kindest form of training. By breaking the institution up into comparatively small classes, under appropriate officers and teachers, every

peculiarity among the children is separately studied, and each one is personally drawn to an affectionate and confidential regard for some one standing in a paternal or fraternal relation to him.

These youths are all committed here by law for their minority; but, unfortunately, the manner in which justice is administered in our vicinity constantly hinders the managers in the use of a wise discretion as to the time of discharge, or as to the parties into whose hands they shall be delivered. The great body of the city children, much to

CHAPEL.

BOYS' DORMITORY.

country, surrounded by happy families, and filling very important positions as teachers and missionaries, who received almost all their intellectual and moral culture within the walls of the House of Refuge. They never forget their old home, or hesitate to express their sense of obligation for its lessons and its aid in introducing them into a higher and purer social circle. There is no difficulty in finding good homes for girls after they have been in the house for twelve or fourteen months. The demand has always been greater than the supply.

their moral peril, must at an early date be returned to their homes. No warrants in our days stand against the wills of magistrates, and men with political influence command the magistrates. How long before the community will learn that society and the children themselves have rights as well as miserable parents and guardians, who care not for the ignorance or viciousness of the youth, if they can realize a few dollars weekly from his or her earnings?

One important advantage of a large institution is that, without an

increased expense, *per capita*, first-class men can be secured to fill its very delicate and responsible offices. If the poet is *born*, and not *made*, certainly reformatory minds are. One of the chief difficulties in inaugurating new reformatory enterprises is the limited supply of the right class of men to comprehend and

DINING-HALL.

young persons. The success of the managers of the Refuge in filling their corps of principal officers has been a matter of constant remark among both American and foreign visitors.

To secure the confidence of the children, and win their affection, to make the Refuge a pleasant home to them, to train

BOYS' WASHING-ROOM.

administer humane and efficient systems of discipline. The two or three men in the Atlantic States, including our New-York superintendent, who have national reputations for their executive and moral abilities, have been tempted, during the last season, with salaries double their present remuneration, to transfer their fields of labor to the West. In these large and carefully-graded institutions, all the departments—health, education, industry, and moral instruction—can command the services of a professional man whose talents and culture secure for him the respect and confidence of the community, as well as eminently fit him for the exacting duties incident to the care and training of such a class of

LITTLE BOYS AT SKIRT-MAKING.

them to respond to the trust reposed in them, and to yield a cheerful obedience to the requisitions of the House, are important objects to be earnestly and wisely sought for, as inmates enter an institution; but when these ends are gained, the great work of starting a youth in an honest form of labor for his livelihood, and giving him defences against the temptations he will certainly meet in society, is but just begun. As affording peculiar facilities for drawing out these traits of character, the opinion among the friends of juvenile reform has, quite generally of late, been disposed to favor an open institution in the country without an enclosing wall. But, when these children have been induced to remain quietly upon

SHOE-MANUFACTORY.

such unguarded farms, only a short step has been taken toward reform. There is not a lad in the New-York House that could not be

SOLING AND HEELING.

trusted to go to the heart of the city without an officer, when placed upon his honor. This is constantly done, in the instance of lads who are permitted to attend the funeral of a relative; and, in some cases, they remain away two or three nights. This trust has never been betrayed. The same boy, however, may not yet be fitted intellectually, industrially, or morally, for a discharge from the House. A young man of nineteen, an inmate of the Refuge, was placed in charge of the ferry-boat,

FINISHING.

for a month, during the absence of the regular officer. He had the supervision of eight boys, from six in the morning until ten o'clock in the evening, with every possible facility for escape, if he had chosen to avail himself of it. He was faithful to the last. A week, however, after the return of the ferry captain, he ran away! He was brought back by the police. No additional surveillance was exercised over him, but his ambition was roused to a better and higher idea of life and duty. He is a manly farmer in Connecticut now, and is happily married. The young woman to whom he was engaged, before marriage wrote to the superintendent to learn how much confidence she might place in his word and character, and received an encouraging answer.

It will soon be generally discovered that the chief trouble is not in the institution, or to be met by the character of its system of discipline, whether congregate or family, but that the trying hour is upon the discharge of an inmate from either form of restraint. The chief work

of the managers of such an establishment is to start a youth fairly in a regular life outside of its limits, and to watch over him in it until established habit gives good evidence of a permanent reform. The renowned German family school of Wichern, at Hamburg, has attained its large percentage of reforms, not because it is broken up into small households, but because of the culture and piety of all its officers, the long period (five years) during which it retains its subjects, its voluntary character, no inmate being sent or retained by

MAKING SIEVES.

law, and especially on account of the watch and care exercised over its subjects after their discharge—being visited *weekly* by officers of the institution.

Three great instruments of reformation are relied upon in the Refuge:

I. *The School.*—The great body of the inmates have either been utterly neglected as to school-training, or have been inveterate truants, or are of a low order of intellect, requiring special care and effort on the part of the teacher. Every day but the Sabbath the children spend four hours in as thoroughly-appointed rooms, and under the tuition of as cultivated teachers, as can be found in any of the common schools of the land. If any child, through deficiency of intellect, or for any other cause, fails of promotion at the regular periods, he is made the subject of special inquiry by the principal. In order to inspire the children to improve their opportunities, no inmate is discharged from the House, except by an order of court, or to a parent who has arranged to send

TYING UP SIEVES.

his child to another school, until he has reached the third class, and thus secured some knowledge of the rudiments of an English education—reading, writing, and arithmetic. The attainments in the Refuge schools, in the judgment of the city superintendents, are fully equal to the average of the public schools, for the time the inmates remain in them.

Still further to quicken the mind, and to awaken an interest in intellectual subjects, during the winter, about once a fortnight, in the evening, addresses are delivered before the assembled inmates and officers, in the great chapel hall, by some of the most interesting platform-speakers of the day, who cheerfully volunteer their services, and in every instance have expressed their great personal enjoyment of the occasion. These exercises are varied with readings, recitations, and concerts.

In addition to this, over two thousand volumes have been gathered in the school libraries, and large annual additions are constantly made.

II. *Work*.—Every day, also, except the Sabbath, every inmate has an appointed task. A portion of the girls are employed in the making of the boys' clothes, a part in working upon their own; a company of lads have the daily duties of the cooking; a number find work in the bakery, and thus acquire a valuable trade; a large body work, during the summer, in the garden and upon the farm—the physical condition of the inmates being considered in the allotment of the form of labor. The great body of inmates are engaged upon different kinds of productive employment, which will be of immediate practical service to them upon their discharge—manufacturing of ladies' shoes, wire-work, and hoop-skirts. Every child has a task arranged according to his age, strength, and time of training—arranged not by the contractor, who supplies capital and carries on without risk to the institution the business, but by the superintendent. No workman employed for the instruction of the inmates can administer the slightest discipline. An officer of the House, in each shop, is alone intrusted with this. A framed copy of the regulations, under which work is performed, hangs

GIRLS' PLAY-GROUND.

in every room, reciting, in conspicuous letters, before the overseers and the youths, the rights and limitations of all parties. No persons stand up more sharply for their just deserts than this class of young persons. For these indolent, vagrant, inattentive, loose-fibred children, no discipline for body and mind, and even for the higher nature, is more efficient in securing positive and permanent results for good, than this admirable system of honest,

est, diligent, daily work. The large proportion of the expense of maintaining the institution, which is secured by the industry of the inmates, is one of the smallest beneficial results flowing from it.

The most interesting feature connected with the industrial training afforded by the Refuge has already been alluded to in one of the incidents related. It was found that a large class of lads were certain to return to the city after their discharge, even if placed upon farms in the country. They had been previously connected with street-gangs of young thieves and burglars, and were quite sure to fall back into their ranks again, and to be forced, even if not readily won, into their old criminal life. They would be returned two or three times to the Refuge, and ultimately revolve between the Penitentiary and State-prison. The favorable result attained in the experiment with the young man whose marriage we have related, suggested a broader application of the plan. Through the hearty coöperation of the contractor, who enters personally into full sympathy with the great objects aimed at by the institution, arrangements were made by which a certain number at a time of the maturer boys could be fully instructed in a trade, and, after a period, receive, in addition to the amount paid for their labor to the House, a weekly stipend. At a definite date, if the boy's conduct and acquirements justified the step, with a good suit of clothes and a small sum of money, he was to be discharged, and permitted to return to daily labor in the shop with the usual journeyman's wages. The result has been interesting and satisfactory in the extreme. Nearly a score of young men, that seemed inevitably predestined to a criminal life, are now earning good

LAUNDRY.

GIRLS' SCHOOL-ROOM.

daily wages, living regular lives, and contributing to the support of their friends. One young man who had been discharged from the Refuge, and found it difficult to keep himself from vicious companions, deliberately stole a garment from a store-door, informed the po-

FIRST DIVISION, GIRLS.

liceman of the act, and requested the magistrate to return him to the House. He has been for a year discharged, is one of the most regular daily workmen in the shop, has united with the Young Men's Christian Association, and brought already two or three others into the Association with him. One lad greatly excited the sympathies of the superintendent. His father was a drunkard, abused his mother, and finally had her committed to the work-house. She begged the son, when released herself from confinement, to obtain his discharge, and come out and provide for her. He resisted her importunity until he had learned his trade, and secured nearly fifty dollars. Just at that moment, his father having deserted his home again, the landlord turned her out upon the sidewalk with her four little children, without shelter or food. Then the boy went to her, and provided comfortable rooms for the family, returning every morning to his work.

GIRLS' DORMITORY.

Finally his father came back, and quite humbly begged admission into the home again. The boy induced him to sign the pledge, relating the story of it to the superintendent of the Refuge with most touching pathos. The father said to him: "We will change places. You

shall be the head of the family; for you have done more for it than I have, and I will do just as you say." One cannot listen, without being deeply moved, to the simple recital of the present comfort which has followed the frightful misery in this rescued boy's home.

A lad of quite remarkable intellectual qualities had been returned three times to the House. He fell at once, each time upon his discharge, into the hands of a gang of reckless fellows, who, knowing his weakness, would ply him with liquor until he was their helpless victim. When he returned, some time since, to his home, being once more discharged, in a fine new suit, he came upon his mother just as she was going out of the house. He called her "Mother." She turned, but did not recognize him. He uttered her name again. The voice was too familiar for a mistake. She led him to the street-lamp, as it was evening, and looked him all over.

"Is it possible that you are my Patrick?" she inquired, with unfeigned surprise, and fell upon his neck.

His trade, his large weekly compensation, his daily call to the shop under the shadow of the old Refuge, with God's blessing, afford a sufficient defence against the solicitations of his former companions, although he boards in his old home in the centre of his former haunts.

With an adequate expansion of this system, there is every proba-

SEWING-ROOM.

bility that a large proportion of these youths, who have heretofore been considered hopeless, may be saved, and be transformed into wholesome citizens and honest producers.

III. *Moral and Religious Training.*—To obviate as far as possible corporal punishment, a system has been arranged, which, from the first, addresses the strongest desires of the inmate. His behavior and progress in school and in the shop, and his general conduct, are made to become the measure of his restraint in the House. If he obtains and retains a badge of good conduct everywhere for a given period, and reaches the third class in school, he is assured of his discharge. This badge becomes a matter of supreme importance to him, and, that he may be impressed with the absolute justice of his discipline, it can only be changed by the highest officers of the institution. No corporal punishment is so effective in its operation as the action of this self-occasioned and self-administered corrective. Every loss of an honorable badge adds an additional period to the time of detention in the Refuge. Every inmate can answer at once the question, "How long before you can be discharged from the House?" A better form of moral discipline could hardly be devised.

A religious instructor, in the form of a chaplain, is a regular officer of the institution, and an occupant of a pleasant cottage upon the grounds. In addition to his Sabbath duties, his daily intercourse with the inmates, and evening prayers, he delivers a weekly lecture before the officers, visits the homes of the children, and the places where they have been indentured in the country. No sectarian religious instruction is given. All religious denominations, with one exception, heartily unite on the common ground of revealed religion as inter-

preted from the Holy Scriptures. For that portion of the religious community unable to harmonize upon such a basis, with remarkable generosity a special provision is made out of the public treasury. Every Roman Catholic parent or guardian can demand that his child or ward be sent to the Protectory in Westchester, and our Catholic magistrates are far from being reluctant to anticipate this request as long as the large capacity of that institution admits of any additions. There the instruction is purely sectarian. Certainly it is a small privilege for our earnest Catholic friends to permit, what they now only reluctantly submit to until such time as the Legislature shall accede to their often-preferred request to Romanize the Refuge, that one institution of reform shall remain unsectarian, teaching to its subjects "pure and undefiled religion" as the "truth is in Jesus," without prejudicing the young *détenus* against any denominational forms or opinions. Subjects are always transferred to the Protectory upon the request of parents, and the incorrigible inmates of that institution are often transferred to the House of Refuge. The Sabbath services, attended nearly every Lord's-day by many of the parents of the children and by visitors from the city and country, are affecting in the extreme, and the moral and religious results of the Sabbath and of the daily religious instruction are constantly apparent.

We have not mentioned recreations and amusements. These, of

SKIRT-MAKING.

course, are indispensable, and should have a large space in the discipline of young persons. In addition to generous portions of every secular day devoted to the most robust and manly outdoor sports, from one to three hours can be, and are, with large numbers, daily redeemed from the period allotted to labor by an early accomplishment of the appointed task. Every public holiday is duly celebrated with appropriate exercises, with special games, with pantomimic and dramatic performances, and with particular animation in the culinary department of the House. A brass band among the inmates also adds its rousing notes to their holiday pleasures. Food and clothing are made the special study of the intelligent physician who daily visits the House and watches over its hygienic as well as its sanitary condition.

Such, then, at the end of a half century, is the New-York House of Refuge. It opened January 1, 1825, with eight children, and it has had since, at one time, one thousand and twenty within its halls. Its average this year has been about seven hundred. There have been connected with it from the beginning nearly fourteen thousand inmates. All similar institutions in the country have sprung from its sowing. It never was in a more efficient condition or administered with more vigor than at present. Only an Omniscient Mind can measure the good that it is and has been accomplishing.

B. K. PEIRCE.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER I.—OUT OF THE DUSK.

IT was drawing toward the close of a soft November day, some thirty years ago, when the sound of children's merry laughter burst suddenly into the quiet garden of a quiet house, situated on the outskirts of the moderately-sized village of Tallahoma, in the populous and wealthy county of Lagrange. The sun had gone down, leaving behind him broken masses of gorgeously-tinted clouds, which were forming themselves into fanciful shapes of mountains and castles, while over the distant landscape the brooding haze of the Indian summer began to melt into the deeper purple of the gloaming; and the peculiar coolness that betokens coming frost, to make itself perceptibly felt in the pearly atmosphere. It was only the first of the month, and as yet but few of the trees had shed their leaves. The russet of the oaks, the pale yellow of the elms, the burning scarlet of the maples, and the vivid gold of the chestnuts, were all in their glory, and formed a bright autumnal background for the sober house which overshadowed the blooming garden, and the noisy groups that were scampering up and down its paths.

Very noisy groups they were; and yet their noise did not seem at all disturbing to a young girl who had followed them out, and stood leaning over the low garden-gate, while they played hide-and-seek among the rose-bushes. Perhaps this noise had grown an accustomed thing to her ears, as a great deal of it was her daily portion; or, perhaps, she liked children well enough to like even this their most disagreeable attribute—a conclusion devoutly to be wished by all interested in her welfare, since Fate had made of her that much-tried being, a governess. At all events she did not heed it in the least. The worse than Mohawk yells of uproarious Dick, the squabbling of Jack and Katy, the indignant remonstrances of elder Sara, and even the lifting up of baby Nelly's voice in injured weeping, were all unnoticed by their young teacher, who kept her eyes steadily fastened on the distant horizon, where the line of dark woods melted into the hazy atmosphere, and the pale-blue smoke curled upward from several unseen chimneys. Not that Miss Tresham did not hear the various disturbances. But, even in the school-room, she ignored a great deal, for peace' sake; and, once out of that durance vile, she left the children much to themselves—giving them, in unimportant matters, that blessed freedom of conduct and speech which no human creature is too young or too ignorant to appreciate.

She was a stately creature, this Katharine Tresham; and one of the women who possess a power of attraction quite apart from personal gifts. Her face was not a beautiful one, by any means; yet few beautiful faces pleased either so well or so long as this, notwithstanding its faults. The gray eyes were very clear and honest in their glance, but there was none of the sunny gleam of violet orbs, or the dusky splendor which dwells in dark ones; the complexion was very fair and pure, but rather pale, unless some quick emotion or pleasurable excitement, sent a clear carmine glow to the cheeks; the nose was straight and delicate, but not in the least classical; and, if the mouth was all that a mouth could or should be, the unusual squareness of the chin gave a finish to the face that was far from adding to its symmetry. Still, no one could deny that Miss Tresham was handsome—handsome in a very striking and aristocratic style—that her hands and feet were irreproachable in size and shape, that her lithe, slender figure was so well developed that not even an artist could have wished for it a pound of flesh either more or less; and that she carried herself with a very distinguished manner. Most women, looking in their mirror at a face so fair and a form so noble, would have been tempted to murmur at the fate which had dealt with them so hardly; but this was the one point wherein Katharine Tresham proved herself something more than mediocre. She did not indulge any vain regrets, or still more vain aspirations; she did not mourn any withered hopes, or bewail any blighted existence: but she took life as she found it, and bore its burden with a courage as cheerful as it was patient. Her employers were always kind and considerate, the children were warmly attached to her, she was beyond the

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

reach of storms that had once beat very roughly on her head, and as her disposition—a disposition more to be prized than gold or precious stones—was eminently one of content, she furled her sails, and rested quietly in the pleasant haven into which she had drifted, where the sea was smooth beneath, and the sky was bright above her. No genius, the reader will perceive; no unsatisfied yearning being, full of repressed passion and morbid longings; only a brave, bright young gentlewoman, who was Christian enough to be satisfied that God knew what was best for her; who took the good He gave, with grateful heart, and rarely murmured at the ill.

She was leaning over the gate now, softly singing to herself a verse of song, and gazing over the scene before her, with eyes that took in and enjoyed all its beauty. But, after a while, the children began a game very near, and sent their shouts ringing through the clear autumn air, with such hearty good-will, that the young governess was fain to put wider space between herself and their merriment. So she turned away, and began pacing up and down a sheltered walk—a walk bounded on one side by the garden-fence and a hedge of Cherokee rose, on the other by tall gooseberry-bushes. A bright-red glow of the flaming western sky fell over her as she moved to and fro, lighting up her rich brown hair, her clear, bright eyes, and her tall, slender figure, and making a very attractive picture of youth and grace, in the midst of the lovely autumn scene. At length, she drew a small volume from her pocket and began to read. Thirty years ago, Tennyson's fame was yet young—not so young, however, but that even in the backwoods of America, men had heard his name; and the girl who paced up and down the garden on that soft Indian summer evening, was steeping her soul in the beauty and music of those early poems which no after-efforts can ever supplant in our hearts. Enthralled in the sweeping rhythm, it was rather hard to be suddenly recalled to commonplace reality by a child's eager, uplifted voice.

"Miss Tresham, Miss Tresham!" sounded the cry, "Look, oh, look, what a pretty horse Mr. Annesley's on! May I—please—may I ask him to give me a ride?"

"Certainly not," answered Miss Tresham, speaking with great decision, but without looking up from her book. "Katy, you know your mother forbade your ever again asking Mr. Annesley for a ride."

"But she did not forbid her taking a ride if Mr. Annesley asked her, did she?" said a gay voice; and the next moment there appeared at the end of Katharine's walk, between the Cherokee hedge and the gooseberry-bushes, a slender, handsome young cavalier, in riding-boots and spurs, who stood with Katy mounted triumphantly on his shoulder, one tiny hand clutching nervously at his coat-collar, and her blond ringlets falling in a golden shower upon his crisp dark curls.

"No, I don't think she forbade that," Katharine replied, looking up with a smile, whether merely of recognition, or of welcome also, it was hard to say. "But indeed you are spoiling that child dreadfully, Mr. Annesley! She never sees you that she does not expect some marked attention, and almost breaks her heart when you do not notice her."

"And do I ever fail to notice her—when I see her?" asked he, swinging Katy to the ground, and coming nearer to Katharine—seeming, at the same time, to bring sunshine with him in his hazel eyes and brilliant smile. "I am sure I am always very attentive—am I not, my little coquette?"

The little coquette said "Yes," very promptly; but Miss Tresham shook her head.

"It seems I must refresh Katy's memory," she said. "You would scarcely believe that the other afternoon—last week some time, I believe it was—she cried all the way home because you passed her without notice, when you were accompanying two ladies down the village street. It was vain to reason with her—both her mother and myself tried argument unavailingly—and she sobbed herself to sleep that night in profound disdain of bread and milk, or even bread and jam, for supper."

"I remember the afternoon," said the young cavalier, a little confusedly. "I was riding with my sister and a friend of hers. But Katy cannot say that I did not speak to her."

"Ah, but you didn't!" said Katy, eagerly, forgetting her contrary assertion of the moment before. "You spoke to Miss Tresham, but not like you always do—and you didn't notice me at all."

"You shall have a ride this evening to pay for it, then," said he; "and I will be more careful in future. Miss Vernon's horse was rather unmanageable, and occupied all my attention. She does not know how to ride as well as you will when you are grown."

"Is she 'fraid?" asked Katy, with great interest.

"Very much afraid," he answered.

Then he turned to Miss Tresham, and asked if she would not come and look at his new horse.

"So you have another new horse?" she said, smiling. "Of course, I will come and look at him. You know horses are my weakness, and—oh! he is a beauty!"

"Is he not?" responded her companion, pleased with her burst of enthusiasm. "I was sure you would admire him.—Soh! Donald! Steady, boy!"

They had approached the gate, and were leaning over it together, while the horse, which was fastened outside, began to move a little restlessly at sight of his master.

"Look at him!" said that master, eagerly. "Did you ever see a more symmetrical form? And his head—is it not superbly set on the shoulders?"

"He is a paragon," said Katharine, playfully. "And—he is not dangerous, is he, Mr. Annesley?—I must go and speak to him."

"He is as gentle as a greyhound," said Annesley, opening the gate for her to pass out. "I only wish—"

But what he wished was left in doubt; for he paused abruptly, while Katharine went up to the paragon, and patted his straight nose and his glossy, satin neck, calling him many pet-names in her clear, young voice.

"What an intelligent eye he has!" she cried, suddenly. "I really believe he understands all I am saying to him. Mr. Annesley, what is his name?"

"Donald is his name; but I do not like it."

"Donald? No; it is not good at all; it is not suggestive in the least; and it is not pretty either. He deserves a beautiful name."

"Give him one, then," said Annesley, quickly. "He will be only too proud to own you as a sponsor. I have no aptitude whatever for such things, and my horses are usually 'the bay' and 'the sorrel' to their dying-day."

"I thought you were more imaginative," said Katharine, absently. "Is he fleet?" she went on, still looking at the horse.

"He is like the wind, or the lightning."

"Is he? Then I will give you a name for him at once. Call him Ilderim."

"Ilderim? You mean—"

"The sobriquet of Bajazet, of course. It signifies 'The Lightning,' you know. Will it do?"

"It is excellent," he answered, as, indeed, he would have answered to any thing whatever of her suggestion. "From this moment, Donald dies, and Ilderim rises like a phoenix from his ashes.—Soh! Steady, sir!"

For, arching his handsome neck like a bow, the new-made Ilderim began pawing the earth so energetically with his fore-foot that he made Katharine beat a hasty retreat.

"What a racer he would make!" she cried, suddenly. "Is that what you intend him for?"

"Why, no; I had not thought of it," he replied. "I was merely attracted by his beauty, and thought myself lucky to get him."

"Lucky!" she repeated, looking up at him with a smile. "Most people are lucky when Fortune has never said them nay in any one desire of their hearts. I suppose you never wished for any thing in your life without obtaining it."

Standing there in the soft, purple dusk, with one arm thrown over his horse's arched neck, with an unconscious grace in the careless attitude, a suppressed eagerness in the handsome face, and a chivalric deference in the uncovered head, it was not hard to believe this—not hard, indeed, to tell that here was one of those to whom had fallen the purple and fine linen of a world which gives to others only serge; one of those to whom its wealth and fame, its love and pleasure, came, as it were, by right divine, and who now and then flash across the path of our work-day lives, and make our twilight seem more dun by contrast with their own radiant sunshine.

"Yes, I have been very fortunate all my life," he answered, more gravely than Katharine's gay tone seemed to warrant; "but the future may overbalance the past, and you may give me my first lesson in de-

nial this very afternoon. I mean to ask a favor of you after a while."

"I hope it is one that I may be able to grant," she said, quietly. "But you know my opinion on that subject."

"That friendship is best kept free from favors?—yes. But I should like to convince you how wrong that is. I should like to make you believe that *real friendship* never hesitates either to give or accept a favor."

"Don't try," she said, lightly; "you might fail, and that would not be pleasant to one who has never known failure. I will grant you this much, however—that, where friendship exists between two people of equal position, they may afford to meet each other half-way in the matter of favors; but, where one occupies the worldly vantage-ground, it is not well for the other to accept benefits which may assume the weight of obligations."

She spoke very calmly; but a hot, red flush mounted swiftly to the brow of her listener. He made one hasty step forward, and then fell back again, irritating Ilderim very much by the unintentional jerk of his rein.

"Why do you say such things? why do you take such a tone about yourself?" he cried, with a sharp accent of reproach in his voice. "You of all women! It is grievously wrong to yourself! It is even more grievously wrong to me!"

"And why should I not look truth in the face?" she asked, gravely. "To say that I am not your social equal means nothing that either you or I need blush to acknowledge. It is merely a conventional accident, and does not even touch the other ground, the personal ground on which we meet—meet, I am glad to think, as friends. That you are Mr. Annesley of Annesdale, of gentle blood and almost princely estate, is a mere chance of fortune; and that I am Katharine Tresham, governess, who teaches Mr. Marks's children for six hundred dollars a year, is equally a chance. I am of the Old World, you know. Perhaps that is the reason why these things seem to me at once a matter of course and a matter of small moment."

The young republican by name, the young aristocrat by race and nature, looked at her in wistful silence for a moment.

"Yet you think of them far more than we do," he said, at length.

"Because I have been trained to do so," she answered, moving toward the half-open gate, "and, perhaps I ought also to add, because I am unfortunately very proud—much 'too proud to care whence I came.' You see I have not forgotten that apprenticeship to the conventionalities which I served when I spent a year as governess in England—a year I would not live over again for untold wealth."

"But that was in England. You are in America now, thank God!"

"Yes," she answered, with an arch gleam in her eyes, "I am in America now—America, where I am theoretically supposed to be the equal in all points of any among your county gentry—we will say, for instance, that lovely Miss Vernon. What would she think, do you suppose, if you suggested that she should call on Mrs. Marks's governess?—But poor little Katy! See how downcast she is looking! She evidently thinks you have forgotten all about her ride."

"I have not, though," said Annesley, half absently; and, looking up, he beckoned Katy to come to him.

The little girl gladly obeyed. She had left her companions to their play, and had been leaning wistfully against the gate, pushing back her bright curls, so as to see what was going on outside, and longing for the signal that was so slow in coming. When, at last, it did come, she bounded forward, and stood impatiently beside the horse, while Annesley gathered up the reins and sprang into the saddle. He bent down and lifted her from the ground to a seat before him, made her kiss her hand to the governess, and they were off, the child's short dress fluttering in the evening breeze as they cantered down the road and out of sight.

Katharine watched them, with a strange sort of yearning in her eyes. Perhaps she was thinking how pleasant it would be to ride down that road, under its crimson and golden woods, in the lovely autumn dusk, with a crescent moon faintly gleaming above the still tinted west, and such a stately and gallant escort by her side as he who had just passed from her sight. Perhaps she thought of those to whom such pleasure was common, and—even the best-disciplined of us will sometimes do such things—contrasted her own life with theirs. Perhaps she remembered that scene of last week, to which she had alluded—the two elegant ladies in their sweeping habits and waving

plumes, the curvetting horses, the flashing bits and jewelled whips, the young cavalier, and the golden sunshine streaming over all, while she plodded by in the dust and shadow. Perhaps she wondered if this dust and shadow were henceforth to be her portion; or perhaps she thought of a time when the sunshine had slept on her path too, when kind eyes and loving tones had followed her, when life had seemed for a short while the fair and pleasant thing which it never seems to any long, when a young girl who bore her name had smiled and talked and jested beneath the waving palms of a distant tropic island, and when—but her thoughts went no further than this. It was only Mrs. Marks's governess who turned abruptly from the gate, and, with a resolute compression of the lips, that brought lines too hard for so young a face, began the same pacing up and down the walk that had been interrupted half an hour before. It was not long before she was interrupted again, for Mr. Annesley did not give Katy a very extended ride. Ilderim was brought up before the garden-gate once more, and Katy, flushed, smiling, yet regretful, lowered to the ground. Then Mr. Annesley sprang off also; but this time he did not fasten his horse to the iron staple so conveniently placed in a large elm-tree near by. Probably something in Katharine's face warned him not to do so—he was very quickly sensitive to any change in that face. At all events, he kept the rein over his arm, and, uncovering as he advanced, spoke, half apologetically:

"I am going in a moment, Miss Tresham, but—you know I told you I had a favor to ask of you. The evening is so lovely, I am sure you will not mind a few minutes longer in the open air."

"Yes, the evening is very lovely, but rather cool," answered Katharine, in a tone which was cool also; "and I cannot promise to make it more than a few minutes, Mr. Annesley, for Mrs. Marks expects me to see that the children come in before nightfall."

"I did not know that you were the children's nurse as well as their governess," he said, somewhat hastily.

"There you are right," she answered, quietly. "But they don't obey their nurse very well, and they do obey me. So this duty has devolved upon me—and it is not a very irksome one. I wish I had none that pressed more heavily."

The young man leaned forward over the closed gate which divided them.

"And I wish to Heaven," he said, passionately, "that I could make your life what it should be!"

She shrugged her shoulders slightly.

"Now, that is very kind, but not very wise. There is One who knows what is best for us; and you might spoil the whole aim and intention of my life, if you went to work to improve it after your own device. Really, I am very well content with it as it is. You must not let that foolish speech make you think otherwise."

"Content! How can you possibly be content with such occupation, such surroundings, such compan—"

"Hush!" she said, quickly; for several small listeners had grown tired of their game, and drawn near. "It is all very pleasant—sometimes I think too pleasant, to last long. But you said you had something you wished to ask me."

"Yes," he answered. "I wish to ask you—well, for one thing, why you will never let me do any thing to make your life more endurable?"

"You do a great deal," she replied, a sudden cordial light springing into her eyes and making them beautiful. "You do more than any one has ever done before in—oh, such a long time! Do you think I am ungrateful for the books and papers, the flowers and music that brighten my life so much? Can you imagine I do not see how much more generous you would be if I could allow it? Surely, Mr. Annesley, you do not think that I have so many friends, or receive so much kindness, but that I feel this in my heart of hearts."

"Then grant me one favor," he said, impulsively. "Promise to give me one pleasure, which will be the greatest I have ever known."

"I cannot promise in the dark. What is it?"

"It is not much—to you, that is. Only that you honor Ilderim by riding him."

Katharine drew back a step in her surprise.

"Mr. Annesley, you are surely jesting! Ride Ilderim!"

"Yes," he answered, with a desperate attempt at *nonchalance*; "ride Ilderim—why not? You cannot say you would not like it; and I

only bought him because I thought how well he would suit you. And—Miss Tresham, pray do not refuse me this my first request!"

Katharine was silent for a moment. Not that she had a thought of yielding to any thing so inadmissible as what he asked; but simply because she was touched by the desire to give her pleasure, which was so delicately veiled. "How kind he is!" she thought, "and yet, poor fellow, how foolish!" Annesley, who had begun to feel uncomfortable at her long silence, was certainly relieved, but yet more surprised, when she suddenly held out her hand to him.

"Thank you so much," she said. "You are so good—so kind! But, then, you know it is impossible."

The action was only one of frank gratitude; but the next instant she was sorry for having given way to it. Very sorry indeed, when, glancing up, she saw that a carriage had approached unperceived by them, and was passing by, while several pairs of eyes looked curiously from the windows at this way-side scene. Katharine drew back her hand hastily, and a shying movement of Ilderim made Annesley turn at the same moment. Thus they both looked full at the equipage, which, truth to tell, was rather a strange one for that road, at that hour.

Not that the equipage in itself was at all remarkable—only a dusty travelling-carriage, with two worn-out horses, a cross-looking driver, a large trunk behind, and numerous boxes on the driver's seat and under his legs. But the fact that it was leaving the village at such an hour, that the road was a retired one, only leading to several country-houses, and to a town distant some forty miles, and that the faces which looked forth from it were totally unknown, conspired to make its unexpected advent surprising. Strangers did not often come to Tallahoma; and when they did, it was generally in the stage-coach, and they ordered supper at the "Tallahoma Hotel," and went to bed like orderly and ordinary mortals. These travellers plainly intended to do neither; and they certainly did not seem very ordinary. The only outside passengers were the driver, who, as before mentioned, looked very cross, and a small spaniel, who looked very tired and patient. But three faces were gazing from the inside, when Katharine with haste drew back her hand, and Annesley turned round. The first that attracted their notice was one which would have claimed attention anywhere, or from anybody. A hollow, attenuated face, with features so finely marked that they stood out like pure Greek chiselling, and eyes so large and dark that they seemed shedding a flood of light over every thing on which they rested, was partially revealed under a black bonnet and heavy crape veil, and showed itself for a minute only—sinking back out of sight immediately. The two others kept their positions, and were hardly less remarkable—hardly less remarkable, that is, to Tallahoma sight; for one was a beautiful bold-eyed boy who was staring with all his might, and hugging closely a small monkey; the other a woman whom Katharine at once recognized as a French *bonne*, in the usual dress of her class. It was a very brief gaze that the two parties interchanged as the carriage moved by, and rumbled away in the dusk. As it disappeared, the eager little voices of the children standing around Katharine found utterance.

"O Miss Tresham, did you see the monkey?"

"Miss Tresham, did you see the little boy?"

"Miss Tresham, wasn't that a pretty lady?"

"Miss Tresham, how funny the little dog looked!"

"Dog! you're crazy! It was a monkey!"

"It wasn't no such thing! It was a dog! Didn't I see it?"

"And didn't I see the monkey? Silly!"

"You're a silly yourself, sir! Miss Tresham, wasn't it a dog?"

"Hush, children," said Miss Tresham, in her governess tone. "There were a dog and monkey both." Then she turned to Annesley. "Who can they possibly be?"

He shook his head. "I have no idea. Strangers, evidently; but where they can be coming from, or where going, at this hour, I can't tell."

"And such strangers! They would not be extraordinary objects on a French or Italian highway; but in this remote corner of the world, they are rather astonishing. Don't you think so?"

"Yes," he answered, "rather astonishing." But it was obvious that they had made but a momentary impression on him, for he turned at once to the subject that had been interrupted by their appearance. "Miss Tresham, seriously, is there any reason why you should not give me this great pleasure?"

"There are many reasons, Mr. Annesley," answered Miss Tresham,

gravely. "But I have only time to give you one at present, and with that you must be content—by doing as you wish, I should make myself the object of countless remarks; and I might probably in the end lose my situation. That would be paying rather dearly for a ride, even on Ilderim. Thank you again, though; and now, good-by."

The young man looked at her in the waning light with a passion of resolve in his eyes. "You will not think of this?" he asked. "You will not even give me time to try and change your resolution?"

"I am sorry to say that I can do neither," she answered, a little coldly. "It is late, and I must really go—and so ought you, for that matter, since Annesdale is five miles off. Here! let me return your 'Tennyson.' I have enjoyed it so much."

He received the volume, and thrust it carelessly into his pocket; then, while drawing on his gloves, he said:

"I have received a packet of new books to-day; may I bring you some, when I come again? There are one or two I am sure you will like."

"Then bring me one or two—not more," she said, laughing. "Poor Mrs. Marks must not be frightened by another such imposing sight as those dozen volumes you sent the other day. Bring some poetry, please. Formerly I did not care much for poetry; now I like it—I suppose because my life is so very prosaic. Once more, good-by."

"Good-by," he echoed.

He vaulted on Ilderim, rode away a few steps, wheeled suddenly, came back, and leaned out of his saddle toward the gate where Katharine was still standing.

"Perhaps I ought to tell you," he said, "that I am not at all discouraged. You may yet ride Ilderim, and I may yet thank you for my first denial."

With this, and before she could answer, he was gone.

CHAPTER II.—MR. WARWICK'S GHOST.

MISS TRESHAM remained standing in the place where Mr. Annesley had left her, for a minute or two, gazing with slightly-knitted brows after his vanishing figure; then she turned, and told the children that it was time to go in.

"It is cold," she said, with a little shiver; "and I don't think there is any use in looking for your father. Since he has not come already, he is not likely to be here for an hour yet."

"We'll have to wait a long time for supper, then," remarked one small murmurer; but that was all.

The legion knew better than to offer any open signs of disobedience to their chief; and, although discontent was rife among them, they followed her to the house.

A flight of steps led from a side-piazza down to the garden, and across this piazza a flood of cheerful light was already streaming from two windows and a glass door which opened upon it.

"Why, papa's here already!" cried Katy, who had bounded up the steps before any one else and taken an observation through the window. "Papa's here already! Where did he come from?"

Then the door flew open with a sudden burst, and the merry little crowd rushed pell-mell into the room.

A very pleasant room it was, with a sparkling, light-wood fire on the hearth, and a well-set table in the middle of the floor—a room abounding in comfort but lacking in luxury, and with little or no evidence of what are called refined tastes. That is, there were few books visible, and they were chiefly of an unused kind. No pictures excepting some ugly daubs supposed to be family portraits, and not even a vase to hold the royal flowers blooming by in such prodigal profusion. The aspect of the place proclaimed substantial ease, nothing more. There were comfortable chairs, and one or two chintz-cushioned couches; there were various tables, with carved legs and bright-red covers; there was a glowering mahogany sideboard, there was a pretty little work-stand that stood in a niche near the fireplace, and there was a clock on the mantel that told the quarters with remorseless exactitude. But the proprietors of the apartment were plain people, of no fashionable pretension, and still less fashionable ambition—people who were "in business," and were not ashamed of the fact; who were well-to-do in the world now, but who had known a hard struggle before becoming so—who were of the best morals, but

of moderate culture; and who, while they were always glad of social advancement and social recognition, never went out of their way to seek either—people, in short, who were types of the best portion of the middle class—the portion that is neither hopelessly vulgar nor absurdly aspiring—and who, in consequence of sturdily respecting their own dignity, were universally respected by those above as by those below them on Fortune's ladder.

The head of the household, Richard Marks, had begun life as a very small tradesman, and it may readily be conceived that the man who sold coffee by the pound, and calico by the yard, across a village counter, was scarcely able to command, or even hope for, any very exalted social elevation. Yet social elevation of a certain sort came with time—as it comes to all men who trust less to fortune than to their own endeavor. To his diligence and energy, and to the scrupulous honesty which made all men recognize his word to be as good as his bond, Richard Marks owed at last an assured competency and an honorable, even an enviable, position among his fellow-townsmen. To these things he owed it that the most aristocratic gentlemen of his native county were proud to hold out the hand of friendship, not patronage, to him; and that, after many years of hard labor, he was now resting on his oars as cashier and virtual controller of the one bank which did all the monetary business of Lagrange County.

His wife, although the daughter of a gentleman—if a spendthrift insolvent deserves the name—had sunk so easily to the social level of her husband that those among her friends and acquaintances who still spoke of her as “Bessie Warwick,” were forced to explain the obvious fact as best they could.

“She never had much sense,” they would say, “and certainly no great amount of refinement—though she was so pretty—pretty in a certain style, that is; and then she inherited low tastes, no doubt. Her mother was shockingly common, if you remember. It was his marriage that ruined Arnold Warwick—at least his friends always said so.”

But, notwithstanding this unflattering opinion, Mrs. Marks certainly proved that she had found her right place in the world as helper of a good man's upward career. The best of wives and mothers—yet, like most best of wives and mothers, apt at times to become a little tiresome, especially if she once began the circumstantial history of Dick's dreadful accident when he fell and broke his collar-bone, or how little Katy whooped through an entire summer with whooping-cough. But a sensible and kind-hearted woman with all that; one of the large class of women of whom the world knows little, and hears nothing; who are not remarkable either for beauty or mental capacity; but who fill their own position in the world better than a Lady Blessington or a Madame de Staël could do it for them; who live a life all pure and blameless in the domestic relations, and who at last go down to the grave leaving in the hearts of their children a good example and a fragrant memory.

In her own way, too, Mrs. Marks was a good business-woman; and the only time in her life that she had acted without due foresight and deliberation was in the matter of engaging a governess for her children. She had accompanied her husband on a short business-visit to Charleston some two years previous to this autumn evening, and while there met Katharine Tresham.

The young foreigner, who had but lately landed, was entirely alone in the strange city; and something in her refined, ladylike appearance, together with her deep-mourning dress, touched the kind heart of the elder woman. They were boarders in the same house, and, when she heard that Katharine was anxious to procure a situation as teacher, that she could give good English and West-Indian references, and that she would much prefer the country to any city as a residence, Mrs. Marks's mind was at once made up. She did not even wait to consult her husband; she made her an offer on the spot, and it was gratefully accepted.

“Indeed, my dear, I could not help it!” she afterward humbly confided to her lord. “It seemed so pitiful to see such a pretty young thing entirely alone; and then, you know, the children learn nothing at all at school. You said yourself that Mr. Watson was good for nothing but to drink whiskey and pay attention to Lucy Smith.”

“I did say so,” Mr. Marks replied, “but are you sure, Bessie, that your new friend will be worth much more? I don't mean, of course, that she will drink whiskey or pay attention to Lucy Smith; but, after all, there may be worse things than that. What does she engage to teach the children, and what are her terms?”

“She engages to teach the children—well, every thing that is

usually taught, I suppose,” answered Mrs. Marks, a little vaguely; “and, as to her terms, she does not seem to know very much about them herself. She taught one year in England, and received forty pounds—that is all she knows.”

“Why, that is a little less than two hundred dollars,” said Mr. Marks, opening his honest eyes. “Teachers must be plenty over there at that rate. Poor thing! I'll tell you what we'll do, Bessie. She is a nice-looking girl, and there'll be no harm in trying her. We will offer her four hundred dollars, and take her for one year.”

So it was settled; and so Katharine Tresham came to Lagrange.

At the end of the year her employers requested her to remain, and Mr. Marks voluntarily raised her salary. The children had improved so rapidly that Mr. Watson would not have recognized his quondam pupils; and the bright, even temper of the young governess made her presence in the house a kind of moral sunshine. Altogether, as Mrs. Marks was accustomed to declare, she could not have been so exactly suited by anybody else in the world; and she would have had no possible fault to find with Miss Tresham if—there is an *if* to every thing earthly—she had been an orthodox member of that religious denomination to which Mrs. Marks herself belonged. But, dreadful to relate, Miss Tresham was that strange off-shoot of iniquity, in the eyes of Tallahoma, a blind and bigoted Papist. She had given Mrs. Marks fair warning of that fact before their engagement was concluded.

“There is one thing I must mention,” she said. “I am a Catholic. I know that most Protestants are very much prejudiced against the faith, and don't care to admit Catholics into their households. If this is the case with yourself, we will not say any thing more about the proposed engagement.”

But Mrs. Marks, although very much staggered by the information, replied:

“My dear, I don't see that it makes any difference. You will be uncomfortable, I am afraid, for there is no Romish church in Tallahoma; but, as far as I am concerned, I—I suppose we are all Christians.”

When the young governess followed her noisy charges into the sitting-room, a pleasant-looking woman glanced up and smiled from her seat by the work-table, while a much older man, with gray hair and frank blue eyes, gave her a hearty greeting.

“Good-evening, Miss Tresham. How do you and the little ones come on?—Well, Nelly, can you spell ‘ab,’ yet?”

“Spell it, Nelly, for your father,” said Miss Tresham, smiling. “She knew it to-day, sir; but I am afraid that hanging head doesn't say much for her recollection of it now.”

“Speak up, little woman,” said her father, lifting the shame-faced scholar to a place on his knee. “Speak up—and I'll give you a sixpence.”

But bashfulness or ignorance continuing to hold the little woman's tongue, Jack and Katy, tempted by the promise of the sixpence, burst out with the spelling of the word desired, and were rewarded by being informed that the offer was not intended for irregular claimants.

“I tell you what I will do, though,” said the indulgent father, seeing the disappointment legible on their faces. “Nelly must have her sixpence—but another shall be found for the first one who brings me the mail from your Uncle John's coat-pocket.”

“Is this mail-day?” asked Katharine, looking up. “Then why did you not bring it yourself, sir?”

“Because I have been in the country on business, and didn't come through town on my way home,” answered Mr. Marks, good-humoredly. “I wish Warwick would come along! I want my papers—and I expect you want your letters, Miss Kate.”

“Letters!” the governess repeated. “I thought you knew that I never receive any letters. There is nobody that I care to hear from. Indeed, the worst luck that could befall me would be a letter—unless it came from Father Martin.”

Father Martin was the priest of Saxford, a somewhat larger town than Tallahoma, boasting a small Catholic chapel, to which she went occasionally for ghostly shriving—and it was certainly true that his rare letters were the only ones that had ever come to Katharine Tresham, since she first set foot on the soil of America. Nor did she ever write any that were not addressed to him. She seemed to have severed every link that bound her to her former life, and, save in a few general particulars, her present friends knew no more of that life than if she had not broken their bread for the period of two years.

"John is very late to-night," said Mrs. Marks, glancing up at the clock, as if it was its fault that the waffles were burning in the kitchen. "I really think we need not wait for him any longer. Some troublesome man has kept him, and he always begs me not to wait.—Sara, go to the door and tell Judy to send in supper."

Sara obeyed; and, the next minute, two mulatto boys began bringing in plates of biscuit and waffles. Then came some broiled partridges, the tempting odor of which caused Mr. Marks to look round with interest.

"By George! that is delightful to a hungry man! Where did you get such fine birds, Bessie?"

"They were brought this morning, with Mr. Annesley's compliments," answered Mrs. Marks, rising and going to the head of the table. "Sent to me, the boy said—you have forgotten the cream, Tom—but I expect Miss Katharine knows more about them than I do."

Miss Katharine smiled slightly, but without the least tincture of embarrassment. "How could I possibly know about them?" she asked. "I saw Mr. Annesley this afternoon—did I tell you that he gave Katy a ride?—but I assure you he did not hint that even one of the partridges was intended for me. You will spare me one, though—won't you, Mr. Marks?"

In the clatter of plates and knives which followed, a step crossing the piazza outside was unheard; and when the door suddenly opened, Katy was the first one to observe it. She sprang forward with a cry of "Uncle John!"—a cry the eagerness of which was more for the letters in Uncle John's pocket, and the promised sixpence from her father, than for the every-day presence of Uncle John himself.

The new-comer surrendered the letters to the quick little fingers that dived at once into his pocket, watched the payment of the sixpence, with a smile, and then walked to the fireplace and sat down, while Mrs. Marks sent out a requisition for hot coffee.

"Never mind about that, Bessie," he said, in rather a tired tone. "What is on the table will do well enough. I only want to get a little warm before moving again—it is quite cool to-night."

"What on earth made you so late?" asked his sister.

"Business," answered Mr. Warwick, briefly. Then he sank back into his chair, and into silence.

It was not an ordinary face, by any means, across which the fire-light played so fitfully—no more an ordinary face than John Warwick was an ordinary man. There was little beauty in it; and that little was more the beauty of expression than of feature; not much grace of outline or delicacy of coloring. But there was force of will and power of thought; there was a keen habit of observation, and sometimes there was an almost womanly gentleness—the latter not habitual nor often to be seen, but coming occasionally to melt the eyes and soften the mouth, around which some hard lines lay dormant. Take it all in all, a face so full of moral and intellectual strength that the wonder grew how this man could possibly be brother to the pretty commonplace woman who sat at the head of Richard Marks's table. Yet her brother he undoubtedly was; and, if Mrs. Marks loved her husband with all her heart, she certainly revered her brother with all her soul—for in him all the gentlemanhood of the father stood confessed, without the father's weakness or the father's vice. He it was who had raised their name from the mire where it had fallen, and given it once more an honorable rank. He it was who had claimed his birthright of social position, and placed his foot, when that foot was yet young, upon the place his father had forfeited. Men already forgot the poor drunkard who had ruined others as well as himself, and only remembered that "Mr. Warwick is decidedly our most rising lawyer." Indeed, they had long since begun to be very proud of him in Lagrange, to put him forward on all public occasions, and prophesy great future advancement for him.

The hot coffee came, and Mrs. Marks announced its arrival to her brother; but he did not move. He seemed, indeed, so deeply sunk in thought as not to hear her; and it was Mr. Marks's brisk tones that roused him at last.

"What's the matter, Warwick, that you sit there staring in the fire, instead of coming to supper? I hope you haven't heard bad news of any kind?"

"Bad news!" repeated Mr. Warwick, looking up with a start. "Why, of course not.—Did you say the coffee was ready, Bessie? I beg your pardon, but I did not hear you."

He rose as he spoke and came to the table. The light thus falling

for the first time upon his face, some change there attracted the attention even of the children.

"Unky, you've got a bad headache, haven't you?" inquired womanly little Sara, by whom he sat down.

"Unky, Jack says you've seen a ghost!" cried Katy, with her mouth full, despite an angry "You hush!" and a push under the table from Jack.

And Mrs. Marks herself said, "What is the matter, John? You look pale."

"Nothing is the matter, excepting that I have had a hard day's work, and am tired," he answered. Then, catching the gaze of a pair of eyes opposite him, he added, "Do I look so shockingly, Miss Tresham, as to merit all this?"

"You look as if your day's work had been a very hard one," said Miss Tresham. "That is all, I think."

"I don't know," said his sister, doubtfully. "John, are you certain that is all?"

"Not quite," he answered, with a fitting smile. "Jack was right in his conjecture—I have seen a ghost."

"A ghost!"

"A ghost, Bessie. As veritable a ghost as ever came out of a church-yard."

"My dear John, please recollect that I don't like such things talked of before the children."

"Oh, there is no rawhead and bloody bones in this," said Mr. Warwick, glancing round at the various pairs of eyes that stared at him from over various mugs of bread and milk. "The ghost was not even dressed in white, Katy—what do you think of that?"

"Oh, it wasn't a real ghost, then," said Katy, breathlessly.

"Yes it was, though.—Come, Marks, put down your paper, and guess whose ghost I saw this afternoon."

Mr. Marks laid down his paper as requested; but confessed himself unable to imagine, unless (with a sly glance at the children) it was that of old Mrs. Packham, who was buried about a fortnight before.

But Mr. Warwick shook his head. It was not old Mrs. Packham, he said; but somebody who had gone away at least twenty years before; somebody whom they all had known. And then he told his sister to guess. Whereupon, after much consideration, Mrs. Marks inquired if it could possibly have been that wild son of old Joe Williams, who ran away ever so many years ago, and had never been heard of since. At which Mr. Warwick shook his head yet more impatiently.

"Then tell us who it was," said she.

And Katharine was struck by a husky tone in the lawyer's voice as he answered—

"I have seen Pauline Morton!"

[TO BE CONTINUED.]

OUR BURGLARS.

I WAS in the middle of a troubled dream about the price of gold when Effie gave me a little pinch and woke me:

"Do you hear that noise?"

"What noise? Where?"

"I think somebody is trying to open a window."

I raised my head in the attitude of a listener for a moment, out of mere politeness.

"Nonsense! it's rats; you know the house is full of them. Or, it may be the wind rattling the casement. It would be a convenience, my dear, if I could be allowed to sleep through one night without being disturbed by thieves and hobgoblins."

I spoke rapidly, and in no very gentle tone. I am not a cross man. I repeat the assertion with emphasis. I am only a little inclined to dyspepsia at times, and my business affairs were just then all in a muddle.

Our house was an old-fashioned castle of a building, which stood in the centre of a half-acre lot. It was in the very heart of the fastest city on this continent. The grounds were filled with flowers, and shrubbery, and peas, and beans, and pumpkin-vines, and cucumbers. On every side of the old mansion were verandas, and side-entrances, and low windows, which must have looked inviting to the members of the light-fingered fraternity. My wife had suggested to me once

or twice that the fastenings on both doors and windows were time-worn and insecure, and I had responded by promising to hire a tinker by the day. I never wanted to have her think about such things, particularly when she ought to be getting her rest, because it left little white circles round her pretty eyes.

I was having some such thoughts in my mind, when there came a vivid flash of lightning, followed by a clap of thunder, which set the house quivering on its foundation. At the same instant my well-toned ears caught another sound, like the breaking of a pane of glass. I sprang out of bed and peered through the half-closed shutter into the yard below. It was pitch dark, and of course I saw nothing. A few rain-drops spattered in my face. I hit my head against the gas-burner as I turned to go to the other window.

"What is the matter?" asked Effie, in a sleepy voice.

"That is what I am trying to find out."

"Don't bother yourself, Cynic, I presume it is a mouse in the cologne bottle, or a cat in the chimney."

Another flash of lightning revealed to my startled vision the figure of a man darting under the barberry-bush.

"Effie! Effie! give me my pistol, quick!"

Alas! It was in the bottom of a trunk in the attic, and the key was on a ring with seventeen other keys, in a box in the china closet in the dining-room. Effie has an opinion of her own about having a place for every thing, and keeping every thing in its place. Just then there came a loud nervous knocking at our chamber door. I opened it promptly, and found our cook, Lizzie, outside, in a state of mortal terror.

She screamed her information. All the burglars on the block must have heard what she said. Her room was in the wing on the ground floor. Her window opened out on a veranda. When she awoke, a man was just in the act of stepping inside. She started to fly from the room and he made a quick movement as if to catch hold of her. She escaped him, but in the passage by the laundry she passed another window which a man was at work trying to open.

"So there are two of them!" exclaimed Effie.

"Three! I saw one myself on this side of the house at the same moment," I replied.

"Are you sure, Cynic? You know Fido is often hopping about the yard."

"Halloa! What's all this?" cried my wife's brother, Jerry, who occupied the room with the arched ceiling on the opposite side of the hall from our own.

"Burglars!" I responded. "Come down with us and help chase them out."

"Have you pistols?"

"Yes, but not at hand. We can pelt them with chairs and crockery."

"I am your man."

He lighted his gas, and so did I mine. We dressed ourselves and went for Hildragon, who slept in the wing directly over the cook's room.

Of course the rascals had had plenty of time to make their wills and take a journey to Salt Lake, while we were preparing for battle. We went down-stairs and found the coast clear. They had been there, though, that was plain enough; the fastening of Lizzie's window had been cut with a very sharp instrument, and one of my hills of beans had been robbed of its pole to make a support for the sash. The fellow's tracks were on the carpet. The shutter had been taken from the window in the passage, and that fastening broken. One of the panes of glass in the great north outer door had been broken, and a man's hand had slipped back the bolts.

We were safe, however, and so was a considerable sum of money which I had brought home with me, because I was too late for the bank.

We did not sleep any more that night. During the next and the following days we discussed the subject pretty effectually. Effie recommended new locks and fastenings, but I was of the opinion that I should be doing the community good service by picking off a regiment or two of housebreakers. I exhumed my pistol, loaded it, and kept it under my pillow. I bought one for Hildragon, and gave him some private instructions in respect to its use. I provided Jerry with a sword-cane that once belonged to my grandfather, and Lizzie was ordered to throw a water-proof round her, and come noiselessly to our room on the first approach of danger.

"But don't you know that lightning never strikes twice in the same place?" asked Effie.

"We shall see." I must confess that I was rather desirous that the burglars should come back. Effie meanwhile grew pale and thin. I think she was afraid I might kill some member of the household with my shooter.

"You certainly will not fire until you have asked who it is, will you, Cynic?"

"Maybe not. But I sha'n't have many words with the wretches. If they don't want to get shot, they must not be caught prowling around my house on dark nights."

"But the baby might have the croup or swallow the match-safe, and then nurse would have to run through the halls."

"I am not blood-thirsty enough to want to kill her; don't get excited unnecessarily."

We did not have to wait always for the crisis. It came sure and swift. It was hardly two weeks after our first scare when the events occurred which make my hair stand on end to relate—it was always a trifle stiff, and I part it in the middle.

It was another stormy night. Signs and shutters banged and clattered. I was wakeful. I must have had a premonition of mischief. Ah! what was that? Yes; I was certain that I heard a door latched or unlatched somewhere not far distant.

"Effie," I whispered, jumping up.

"Well, dear, what is it?"

"Somebody's in the house; don't make a noise, for your life!"

"I do wish the thieves and hobgoblins would let me sleep till morning," and she turned over without manifesting the least apparent interest in the matter. I found afterward that she had slid my pistol down between the sheets where I could not reach it easily.

I opened the door into the hall and listened. A step! Yes. It was approaching, stealthily. Nearer, nearer, and more near. I could almost feel the villain's breath in my face. I banged the door together and rushed for my pistol.

"Where is it?" I asked, excitedly.

"You had better see who the person is, Cynic. Perhaps it is one of the servants," and not finding me eager to ask the first question in the catechism, Effie went herself to the door before I had time to say "Jack Robinson."

"It is me, madame," replied the well-known voice of Hildragon, in a strange whisper. "There is something going on in the house. There has been a gentle wee bit of a knocking right in my floor, for an hour a'most. It goes tap, tap, tap, just three times, then stops awhile. I thought it was spirits and didn't like to make much of a stir, but finally I kinder thought to myself they would be in more respectable business than bothering round that way, and I grew to suspicioning that the house was broken into."

Effie threw her wrapper about her and proposed to go to Hildragon's room, and listen for herself. I went too, a trifle dumfounded by my wife's exhibition of common-sense bravery. Sure enough, we heard the rapping, there was no delusion about that.

"This is over Lizzie's room. She must be in some trouble," said Effie.

"It cannot be Lizzie, for the raps are in the floor unmistakably. She never could reach the top of her room."

"I will go down and see," said Effie.

"Oh, no! not you! The house may be full of concealed demons. Stay quietly in your room, and I will manage this business."

We spoke in softest whispers. It was but the work of a moment to organize my army. I was captain-general, Jerry was aide-de-camp, and Hildragon was high private. Effie insisted upon bringing up the rear, to look after the killed and wounded.

We put on our coats, that we might not be seen so readily in the dark. My orders were:

"Single out your man, and take steady aim."

It was a silent, solemn, ghostly procession that started out on that midnight march. Step, step, step, along the corridor, carefully, creakingly down the stairs, through the long north hall to the west wing of the building, each and every one of us in breathless dread of dire calamity. I was conscious of an intense longing for those peaceful days when my blood was not so stirred with the hope of shooting a burglar. I was foremost, and might encounter one at any moment, and what if he should kill me instead of I him! who would comfort my widow and fatherless ones?

There was a squeak in the floor under my feet, and I jumped backward into Jerry's arms. The shock gave him a retrograde impetus, and he rested in the bosom of Hildragon. The latter individual resisted manfully, but was obliged in the end to fall back, hitting his brawny elbow against Effie's face.

I regained my equilibrium and we moved on. Before Lizzie's door we halted and hearkened. All was still as the grave. Five minutes, ten minutes, twelve and one-half minutes—then we heard, distinctly, three knocks.

I quaked from the crown of my head to the sole of my feet. But my presence of mind forsook me not. I ordered Hildragon to fix his eyes upon the window in the far end of the room, and fire immediately if a shadow should come between. I stationed Jerry with his uplifted cane a little to my right, for the purpose of knocking down any similar apparition.

"Let me speak to Lizzie," said Effie, laying hold of my arm. Before I could reply she had pronounced the girl's name with her lips close to the key-hole.

There was a stifled sob within. "Oh, Mrs. Croaker, help me. They have fastened me up and are all over the house stealing every thing, and I can't get up-stairs to tell you."

A council of war decided on bursting open the door; therefore, we three masculines ran against it with all our united force, and it yielded without a struggle. Lizzie stood on the bureau. She had been waked by some unaccountable noise, and in trying to open her door found herself a prisoner. Not daring to scream, she had patiently and persistently applied herself to knocking on the wall over her head. Effie took her up-stairs and we commenced a vigorous and thorough search for the enemy. We went into all the pantries and felt round under the shelves. We groped behind sofas and under beds. We uncovered stoves, and explored in soot and ashes. We took out registers, and probed the furnace-pipes. In short, we examined every possible and impossible place, and lastly struck a light.

Every thing was just as it had been left the night before. The windows and doors were fastened, and the shutters closed as usual.

"Who could have locked that girl into her room?" asked Jerry, just before we disbanded.

"Oh, I can tell you," said Effie, leaning over the balustrade. "There is no lock on her door, nothing but a small bolt inside. She must have got frightened, and, in her excitement, pushed it the wrong way, and imagined the rest."

We laughed a little among ourselves.

The next day I invested in a stock of hardware, had the house made as secure as possible against intrusions from without, returned my pistol to Effie for safe-keeping, and myself to my old habits. The burglars have not visited us since.

M. J. LAMB.

FOREIGN ENGLISH.

HOOD ridicules an offensive class of English tourists, who, having "done" the Rhine and made the tour of Germany, "bore and Germanize us like so many flutes—who have been at Cologne, and at Koeln, and at Colon; at Cob-Longs and Coblenz; at Swang Gwar and at Saint Go-er; at Bonn, at Bone, and at Bong." But this sarcasm—chiefly resting upon a matter of pronunciation after all—is unjust. The luckless traveller who has seen and heard his own vernacular and inharmonious English tongue clipped and tortured upon the rack of the German, is altogether excusable if he fail to master the *Ich*, and the diphthongal *æ*, and the guttural *g* of the Teuton dialects. To mispronounce German proper names is a sin venial in the eyes of the fair-minded critic—especially if the sinner be an English-speaking person—for is it not a legitimate act of reprisal for a barbarous travesty like the following formal notice, conspicuously displayed, in large type, in the chambers of one of the principal hotels in Wiesbaden, directly above the bell-pull of the "annunciator?"

"Wanting one of the domestics, one must put the finger upon that white button. Leaving *once finger long* there it is *merked* by a stroke (—), less long by a point."

It was a considerate act of the Wiesbaden innkeeper to enlighten his guests concerning the proper use of the signals of the house, even

in such pigeon-English as this. The meaning of the notification was clear. The definition was precise. One finger only was to be placed "upon that white button;" the diameter of the button being one-quarter of an inch, it would have been difficult to apply more than one finger at one time. The continued pressure of one's (or "once") finger produced a telegraphic signal in the form of a horizontal line at the other extremity of the wire. Observe how neatly a knowledge of this fact is conveyed: "It is merked by a stroke." Nothing could be clearer, except that perhaps there is some degree of confusion in the use of the little word "it." Does "it" refer to the stroke, to the finger, or to the button? However, as the machine was musical and rapid in its operation, the clipped style of the explanatory card did not materially signify.

A larger variety of funny renderings of English is to be found in a little volume entitled "The Legends of the Rhine, from Basle to Rotterdam," than in any other current work of its size. This book was published in Mayence last year, in the form of an 18mo of something over three hundred pages, and, in its English dress, was intended for the use of Rhenish tourists—English or American—who desired to know the traditions that people the rugged crags and mouldering castles of the lovely Rhine. The author of this unique production is Herr Kiefer; the translator, one Garnham. Both these gentlemen have performed their work admirably—the author, in crystallizing the old legends of the Mouse Tower, the Seven Sisters, the Foot on the Wall, the Treasure-Seeker, the Brothers, and the other weirdnesses of that region; and the translator, in his peculiar and ambitious flights toward the mastery of a foreign tongue.

The legendary tales contained in the volume are preceded by an English version of Stolterfoth's poem, "Rhine-Life," presented in this singular guise:

"On the Rhine blooms fine life!
From the Destruction's Dust,
The Ancestors' spirits strife,
Which long were the Graves' rust;
And Songs there resound
With harmonious stream,
In the spirit again found,
And again must I dream.

Soon speak Ore, Stone, and Wine,
Of the strange past Times,
Sometimes talk the folk on Rhine
Of the fabulous old Rhymes.
We inherited many traditions,
And ever believe anew,
Who ventures useless additions:
Or asks if they are really true?"

The legend of "The Devil's Ladder," at the Castle of Lorch, is the story of a beautiful maiden, Gerlinde, kidnapped by a gnome, and rescued, through the timely aid of good fairies, by a valiant knight, to whom, as a matter of course, she is subsequently married. This legend, the narration of which occupies eleven printed pages, gives our translator a magnificent opportunity. The picturesque incidents of the story carry him away; plain prose fails to give adequate expression to the emotions inspired by the romantic tale; and, therefore, he often "drops into poetry," like Dickens's queer little old man.

The story runs to this effect: Gilgen, an old knight, sitting silent and absorbed in his Castle of Lorch, "the ruins of which one sees not far from Assmannshausen," reviews the stirring scenes of his life, and laments the "unsuccess" of his hazardous enterprises. A professor of the black art has just left him, promising a future revelation of the place wherein to find a hidden treasure. The weather is rough. The wind howls around the towers and bastions of the castle. The weather-vane creaks, and the clouds hurry past. All Nature "seems to be in revolution." At the height of this disturbance of the elements a messenger breaks in upon the reverie of the knight to announce the arrival of "a strange little man," who has imperiously demanded a night's lodging in the castle. The meditative knight, rousing himself with an effort, goes forth to receive his visitor. The sprite whom he encounters is pictured in choice and ringing metre:

"A dwarf scarcely six span tall,
In scarlet-colored garment,
Flowing over his shoulders as a pall,
The gray-locked hair seemed to torment.

"A small yellow cap, in tassels rich,
First narrow, then wide, as a pear,

Ascended almost like a crown, *which*
The deeply-fared brow seemed to bear.

"He twirled a small staff in the air,
And unintelligibly talked—
Appearing a *Being of precipice rare*,
As if from deep ravine he walked."

This dwarfish being, "of precipice rare," gives sudden and rare offence to the knight, for he is an "inimical gnome," against whose machinations Gilgen has been warned. Refreshment and shelter are refused; hard words are passed; and then doors and windows are fast shut and barred; and forth into the darkness and the tempest speeds the fiend. Then the catastrophe.

On the following day, returning from the hunt, Knight Gilgen misses his daughter, the fair Gerlinde. In his absence, three dwarfs, in red mantles, suddenly appearing in the castle, have seized the maiden and led her captive to an inaccessible mountain-fastness on the cone of Kedrich. There the furious father, giving hot chase, discovers her; but afar off—he, helpless to release her; she, unable to go to him. The fiend, grinning in triumphant hate, sends down the defiant shout: "This is the reward for your hospitality!" The good knight, beside himself with grief and rage, seeks to hew a way *up* the face of the granite rock, but the hard stone resists all his efforts, and in despair he turns for aid to the hermit from whom he had lately parted. The aid of magic power again invoked, an incantation ceremony is performed, the magician chanting such weird lines as these:

"The on Kedrick living gnomes
A knight's child have stolen;

Oh, help with your whole might,
You master of the midnight!
Thee a pair of owls bring I you,
And a goat as sacrifice true!"

A brave "black knight, and horse as black," are brought to the rescue by the skill of the wise man, and the good Knight Ruthelm immediately proceeds to qualify himself to become Knight Gilgen's son-in-law. By the aid of the friendly magician another company of elves appears, and "the chiefest and tallest" of them announces that they are about to "build the ladder" with which to scale the cliff. "Directly the dwarfs hastened into the wood; then began *carpentering*, hammering, sawing, and cutting." In a twinkling a gigantic ladder leans against the steep wall of the rock; up mounts the adventurous knight, wearing upon his finger a talismanic ring, the gift of the magician, by the turning of which he is to repel the assaults of the foul fiends. A fierce battle ensues, and the maiden is rescued. This happy ending is described by the translator in the following fashion:

"Soon the adventurer saw a crystal palace, before which stood two red gnomes, evidently should have stood as sentinels, but fortunately had fallen asleep. *Without much reflection*, he cut off their heads, then forced his way into the castle, and here he met the ravisher of Gerlinde. Immediately they seized their swords, and began a violent struggle." (Here follows the account of the victory.) "Gerlinde reposed in an agreeable morning slumber, and the knight thought never to have seen a more charming creature. The knight awoke the beauty with a kiss, and, in begging her not to be frightened, he told her he was come to free her and to conduct her to her father's arms. The dear child *believed to dream*, as she heard such words from an unknown knight; however, she willingly resigned herself to the guidance of the knight."

This legend is a favorite with the Rhine-folk. The yellow-haired children hear it told by mother, nurse, and grand-dame; and it cannot be denied that translator Garnham has given his whole mind to the presentation of it in the very best English at his command. Those who read his story in company, on a certain lazy day last summer while floating down the Rhine, were certainly his debtors, for the sorrows and the joys of the fair Gerlinde lent a new interest to the decaying ruins which crowned the height of Lorch.

But neither the Herr Kiefer nor his translator exhausts his resources with a single tradition. There is another legend in the same volume, called "The Archer," which abounds in pigeon-English. Its hero ventures all "to procure certitude," and springs to the relief of "this-poor-against-all-laws of chivalry-imprisoned and blinded man"—his father. In another narrative, an old count sees, with affliction, a "changement" in his son; and a lover sings to his mistress:

"Thy Garment color wave-dove,
By thy hand the sign of love,

Thy eyes sweet enchantment,
Ray'ing to me, oh! enhancement!"

Travellers in Germany find numerous specimens of Germanized-English in the bills received at hotels, in little pamphlets distributed as advertisements of wares in market, in the corners of the public prints, and in official notices setting forth the regulations for the government of places of resort; but the most comical things of this kind are the guide-books. The "Guide to Hombourg," for example, informs the stranger that the Administration of the Kursaal engages the services of a musical band, whose performances "enhance greatly the *sejour* of visitors;" and likewise imparts the information that traces of Roman occupation still exist in the neighborhood of that charming (but wicked) watering-place. "Nearly 2,000 years ago," the record runs, "numerous Roman armies well armed and disciplined penetrated into Germany, and particularly took possession of this country."

The French rendering of English is often very comical; and the famous "Guide to Rouen" is perfect of its kind. In the Rue d'Autin, in Paris, is a fashionable tailor, whose business-card informs the public that, in his establishment, English is "spoken;" and strollers on the Boulevards, in the days when Paris was Paris, unbeleaguered and happy, were often thrown into fits of laughter by the absurd efforts of shopkeepers to master the intricacies, or to overcome the formidable difficulties, of the English tongue.

Yet the Frenchman has his own laugh—and a hearty one we can believe it is—at the broken French which limps from between the lips of the pompous Englishman and the unabashed American. And the German, too, enjoys his private titter when he hears the patched phrases and curious introversions of the unskilled foreigner. We, in our turn, laugh at both. We can all afford to laugh and be merry-together—remembering what Carlyle says of the right of every man's mouth to "unpucker itself into a free door-way."

AUGUSTUS MAVERICK.

ASKING.

I BENT me o'er her fluttering hand;
I said: "The world is wide;
Around our steps, a spectral band,
The doubtful shadows glide;
Joined hands are strong when foes combine
And clouds drive fast o'erhead."
She raised her grave, pure eyes to mine,
But not a word she said.

"The path is rough for tender feet;
The outside winds are chill;
For tired eyelids rest is sweet—
Why doubt and linger still?
We'll stand serene till shadows flee
And life's last storm be dead."
No answering look came back to me,
And not a word she said.

"Ah me! I thought you loved me well—
Our human eyes are blind;
He only reads life's parable,
Who never looks behind.
Alone, and reft of love's sweet grace,
My onward path I tread."
Again the mute eyes sought my face,
But not a word she said.

"Hear, then, my last, my parting prayer—
I love you! Will you come,
My joys, my griefs, my hopes to share,
Till each quick pulse be dumb—
Secure, serene, my own heart's queen,
Though storms beat dark o'erhead?"
The pure eyes drooped; but now, I ween,
'Twas but one word she said.

BARTON GERT.

THE OLD MILL.

"THE Old Mill" is from a painting by M. Grandsire, a French landscape-painter of reputation. It formed one of the leading attractions in the Paris Exhibition of last May. There is, perhaps, something conventional in the subject, for old mills have always possessed a charm for painters, and have been multiplied on canvas to a great extent. But this is no wonder. Few objects in Nature possess more strikingly picturesque features. Even in the most prosaic landscape an old, quaint, weather-beaten, tree-embowered mill, with its hum of wheels and fall of waters, possesses a marked attraction, and will delight sensibilities much less keen than those of painters. Many of us are prone, in uttering Rogers's "Wish,"

"Mine be a cot beside the hill,"

to require, as a completion of the ideal picture, that there should be

"A willow brook that turns a mill."

The picturesque features of M. Grandsire's painting are certainly fine. There is a management of light that gives a striking contrast between the brilliancy of the sky and the afternoon shadows gathering solemnly about the old building. The landscape is unlike our American forest-groups. It is true, no doubt, in local color, but it presents characteristics that are essentially foreign.

BARBARIAN ARITHMETIC.

"Clown. Let me see; every 'leven wether—tods; every tod yields—pound and odd shilling: fifteen hundred shorn—What comes the wool to?"

"I cannot do't without counters."—WINTER'S TALE, Act IV., Scene II.

ACCORDING to the school-laws of this city, all resident children, of four years of age and upward, are entitled to the privileges of the public schools. The course of instruction prescribed for the first five months includes objective training in counting by ones up to a hundred, and by twos and threes to sixty.

Not a very difficult task, you say, to learn to tell off a hundred objects in five months; but are you aware that a very large portion of the human race have been as many thousand years learning that same lesson, and haven't mastered it yet?

To us, who began to count almost in our cradles, there seems nothing very formidable in the ten digits; yet they transcend the mental reach of more than one savage tribe.

"I count the gray barbarian lower than the Christian child," the hero of Locksley Hall exclaims, when he returns to his senses, after his mad project to "burst the links of habit" for a life of tropic freedom; and in no respect does the adult savage show himself lower than the child of civilization more plainly, than in his inability to use abstract numbers. There is "no more striking proof of the low mental condition of many *savage* races," says Sir John Lubbock, "than the undoubted fact that they are unable to count their own fingers, even of one hand."

An old writer remarks that those who watch the progress of children can easily see that their scales of reckoning are successively one and more—one, two, and more—one, two, three, and more—and so on. Exactly the same progression is observable among nations, though no people has yet been found at the first and lowest stage. The Bushmen of South Africa, according to Lichtenstein, were at the second stage. They could count two, but no further. The same is said of the Wood Indians of Brazil. The Cape Yorkers, of Australia, had but two numerals—*naes* and *netat*—though they counted somewhat further by repeating these, as *naes-netat*, three; *naes-naes*, four; *naes-naes-netat*, five. Their mental development had, it seems, outrun their language. Galton found the Damaras, of tropical South Africa, using no numeral beyond three. When they wished to express four, they took to their fingers, which they found by no means easy to manage. They puzzled very much after five, because there was no spare hand to grasp and secure the fingers required for units. The description which Mr. Galton gives of the difficulties these people experienced in carrying on trade, is quite amusing. Thus, suppose two sticks of tobacco to be the rate of exchange for one sheep: it would sorely puzzle a Damara to take two sheep and give him four sticks. "I have done so," says Mr. Galton, "and seen a man put two of the sticks apart, and take a sight over them at one of the sheep he was about to sell. Having satisfied himself that one was honestly paid for, and finding to his surprise that exactly two sticks remained in hand to settle for the other sheep, he would be afflicted with doubts; the transaction seemed to come out too 'pat' to be correct, and he would refer back to the first couple of sticks, and then his mind got hazy and confused, and wandered from one sheep to the other, and he broke off the transaction until two sticks were put into his hand and one sheep driven away, and then the other two sticks given him and the second sheep driven away."

That the Damara's conception of number was very dubious, is shown by another illustration wherein number is complicated by quantity; indeed, when his mind is bent on number, the Damara appears to have been quite incapable of thinking of quantity. The price of a heifer was ten sticks of tobacco. In making the purchase, Mr. Galton would place a stick on each finger of the seller's outspread hands. "He gathers up the tobacco, the size of the mass pleases him, and the bargain is struck. You want to buy a second heifer; the same process is gone through, but half sticks instead of whole sticks are put upon his fingers; the man is equally satisfied at the time, but occasionally finds it out, and complains the next day." Mr. Galton, it seems, was somewhat unlike Truthful James of the ballad, who was

"not up to small deceit
And other sinful games;"

and he might be suspected of practising on his too-confiding readers,

if other observers did not sustain his testimony. In the following episode, which is not at all complimentary to the "man and brother," the traveller may possibly be exercising the traveller's privilege; the reader can take the story for what it is worth:

"Once, while I watched a Damara floundering hopelessly in a calculation on one side of me, I observed Dinah, my spaniel, equally embarrassed on the other. She was overlooking half a dozen of her new-born puppies, which had been removed two or three times from her, and her anxiety was excessive, as she tried to find out if they were all present, or if any were still missing. She kept puzzling and running her eyes over them, backward and forward, but could not satisfy herself. She evidently had a vague notion of counting, but the figure was too large for her brain. Taking the two as they stood, dog and Damara," observes Mr. Galton, "the comparison reflected no great honor on the man."

In using his fingers for "counters," the Damara follows the natural instinct of all mankind. What could possibly be more "handy" for the purpose? The possession of proper words for numerals does not always do away with finger-counting, as our school-children demonstrate every day. Among the Hottentots, Lichtenstein found a tribe who, though their language contained words for the smaller numbers, rarely employed any thing but the finger-sign. Many of them did not even know the numbering words. "Beyond ten," he says, "even the most learned could not reckon, nor could I make out by what signs they ever designated these higher numbers."

The Coroado Indians counted by finger-joints—three being their limit of definite numbering. It seems almost incredible that they should not have had the wit to count also the joints of the second finger, and so get six; but it appears that they did not. Many of the aboriginal Australians could not count beyond four. Their term for five, like our word *many*, implied any large number, that is, in their case, any number beyond four. Dobrizhoffer found the Guarani Indians in the same mental condition. They could manage numbers up to four with tolerable facility; but when questioned in regard to a number exceeding four, they replied, *ndipapahabi*, "innumerable." The same worthy missionary spent eighteen years among the Abipones, of Paraguay. This tribe had but three proper numerals, or numbering words with no other signification. They did not stop counting, however, with the number three. To express four, they said *geyeuk nate*, the "fingers" of an emu; five had two names—*neenhalek*, a beautiful skin spotted with five colors, and *hanambegem*, "the fingers of one hand." Ten was "the fingers of both hands." This method being rather cumbersome, they usually resorted, for dispatch, to the exhibition of their fingers, or their fingers and toes, as the case might require, it being much more expeditious, for example, to show "the fingers of both hands and both feet," than to speak the equivalent—*lanám rihgem cat gracherhakaanamichirihgem*. For a number larger than they could count, they had recourse to a handful of sand or grass, as do *savage* tribes the world over. When the "noble red man" tells the white man that the pale-faces are more numerous than the leaves of the forest, or the sands on the sea-shore, sentimental people give him credit for a rich vein of poetry, or a surprising appreciation of the number and power of the whites; yet he would use the same expression for any number beyond the limited range of his numerals—to a ship-load of half-starved adventurers, as soon as to a great nation.

The Abipones had but one ordinal: the first, *era namachit*. They had also a word for *last*, and words for *once* and *twice*, and there their arithmetic ended. The poverty of their language, in this respect, was the source of much affliction to the good missionary, for it afforded him no terms for numbering the Ten Commandments! As numbers were very essential in the services of the Church, he tried to teach his docile flock to count in Spanish. They learned the words quickly enough up to a thousand; but they were so uncertain in their application of them, that it was all labor lost.

The nations along the Lower Murray, of Australia, like the Cape Yorkers, had but two numerals; these they repeated, until they made up five, which they called *ryup murnangin*, "one hand." Ten was two hands. "Hand" is likewise a common name for five, in many of the Malay dialects. This secondary use of the word for hand is also common to the Yalofs and Foulahs of Africa. It appears also on the opposite side of the globe, in Labrador, where *tallek* stands for both *hand* and *five*. The last-mentioned African tribes say "hand and one," for six; "hand and two," for seven, and so on, up to ten, which

is "two hands." Fifteen is "three hands." The Ahts follow the same plan as far as eight, and then they change the order. Instead of saying, for eight, "hand and three," like the Yalofs and Foulahs, they say "two hands less two." Their word for one, as Sproat tells us, in his "Scenes and Studies in Savage Life," occurs in those for six and nine, while that for two appears in seven and eight. This peculiar etymology plainly arises from their method of counting, which is with both hands raised, with palms upward, and fingers extended. For one, they double down the little finger; for two, the next finger; and so on. Five is a full hand. Six closes the little finger of the second hand; seven, the second finger; eight, the third. Now, the most noticeable feature of the hand is, that two fingers (finger and thumb) remain extended. Eight is two full hands less two, and that fact is expressed in their name for the number. Nine, in like manner, is two full hands less one; so their word for nine comprehends the word for one. Thus, they express in words what the Romans did in their notation. As regards the use of the fingers for counters, the Aht method is manifestly superior to that of the Damaras, since each hand holds its own "digits," and there is no difficulty in passing from the first hand to the second. The Zulus begin to count with the thumb, instead of the little finger. For six, they say *talitisaupa*, literally "take the thumb;" that is, having used the fingers of one hand, take the thumb of the next. Among the Zamuca and Maysca Indians, Humboldt found a system of numeration in which five was not simply *hand*, but "hand finished." Six was "one on the other hand." Ten was "two hands finished," or, more briefly, *foot*. Eleven was "foot-one;" twelve, "foot-two," and so on to twenty, which was "feet finished," or, briefly, *man*. The Carib word for ten meant literally "the fingers of both hands;" that for twenty signified "fingers and toes." In Labrador, likewise, the term for twenty implies hands and feet together. In the Chibeha language, twenty was represented by "foot-ten," or sometimes a shorter word, derived from *gue*, a house. Forty was two-twenties, or two houses; sixty, three-twenties; eighty, four-twenties (like the French *quatre-vingt*). One hundred was five-twenties. The ancient Mexicans developed a very complete numerical system with twenty as a multiple, as we use *ten*.

The Indians of Guiana follow the same plan, though not so extensively. Mr. Brett, for some time missionary among these tribes, gives a very interesting account of their efforts in arithmetic. For the first four numbers they have simple numerals, in Arawak: *abar*, *biana*, *kabuin*, *bibici*. Five is *abar* (one) *da' kabo* (my hand). Six is *abar-tinen*; seven, *biam-tinen*. For eight and nine, they use the remaining numerals with the unexplained word *tinen*. Ten is *biam-dakabo*, "my two hands." From ten to twenty, they use their toes, *kuti*, with the repetitive word *bana*, or *banano*. Thus, eleven is *abar-kuti-bana*. Eighteen is *kabuin-tinen-kuti-banano*. Twenty is *abar-loko*, "one man." Above twenty, they reckon by scores, or "men." Forty-five, for example, is laboriously expressed by *biam-loko-abor-dakabor tajeago*, "two men and one hand upon it." The other tribes of Guiana follow the same method of numeration. During his labors among these tribes, Mr. Brett found the children reasonably bright, and apt to learn in all the elementary branches of education except arithmetic. Of this they could not comprehend the simplest rudiments. The cumbersome method of reckoning by hands and feet and complete men, which they had learned with their mother-tongue, was, to his mind, an insuperable barrier to their mastery of the decimal system. Perhaps the incapacity of savages for computation may have made their task still harder.

By the time a nation has developed any considerable degree of civilization, its numerals are usually so worn down by use that their primary meaning can no longer be detected; or, having been imported from some more advanced country, their reference to the original counters is buried in the etymologies of some other tongue. The Latin *digit* still remains to show the use to which the early Romans put their fingers. The Greek *penle*, to which our *five* is traced, is evidently related to the Persian *pencha*, a hand; both words are doubtless derived from the same primitive. If our word *many* (Anglo-Saxon *maneg*, Gothic *manags*), some form of which appears in so many Indo-Germanic tongues, has any relation to the Latin *manus*, it carries us still farther back to the time when our Aryan ancestors—like the aborigines of Australia, Africa, and South America—could count no farther than the fingers of one hand.

JAMES RICHARDSON.

THE SANDY-HOOK LIGHT-SHIP.

TWENTY-SIX miles from this delightful city of New York, seven from a dreary, dangerous spit of sand, and fourteen good fathoms from the bottom of the ocean, there floats and heaves a blessing to mariners, an object of sentiment to travellers, a thankful sight to hordes of sea-sickened immigrants, namely, the ugly-shaped, salmon-colored, uneasy, but steadfast light-ship.

Few works of man get more of man's unreasonable nonsense in the shape of thanks and gratitudes than this tethered guide and finger-post, and few deserve them more. As gratitude goes, this ill-conditioned craft probably gets the cream of the article. It is difficult to conceive of deeper thanksgivings than are poured from the inmost souls of the weekly five thousands of storm-racked, landless, and stifled wretches, who see in it the very first belonging to their new homes. Its pink sides and uncouth plungings, together with its unintelligible signs, painted in white letters, become enshrined as household words, and the day when first they cast their weary eyes upon it is henceforth an era of the happiest sort.

It is not the most disagreeable sight in the world to see some hundreds of pale and swarthy faces, belonging to strangely-attired personages of all ages, suddenly turn in response to a hearty shout and gape at the light-ship, as they come up with it; nor is the long-drawn shout of welcome, with which they greet it as they perch and hang upon the rigging of their own inward-flying vessel, at all amiss to any lucky listener. There is a cheery, earnest ring about the sound, given as it is by all pipes and keys, Italian and Swedish, young and old, feeble and vigorous, man and woman, girl and boy, and impressed with a great flourish of dingy caps and whitish aprons; and it seems impossible that it all shall fly and vanish with the first day's struggle for bread and butter. But for the present they keep it up till they are hoarse, and fade away leaping and swinging their arms in ecstasy at having now actually seen and passed the first proof that America is real and substantial after all.

The light-ship is answerable for a great deal of bewailing at the hands of outgoing ducks and darlings, whose love of country flares up like a powder-blast on realizing that this dear hulk is the last sight they behold of their native land. They never knew before how near Sandy Hook lay to their tender hearts. They are charged to their finger-tips with poetical sentiment, and hurry to avail themselves of this first opportunity to let off some rhyming sparks, which start their diaries off in appropriate style, and all are devoutly thankful to this bobbing and ungraceful craft for giving them the chance.

The calm and grateful shepherds of comfortable city flocks, with substantial forget-us-nots in their trousers-pockets, being duly crammed with the habits and manners of the ancients, and fondly dreaming themselves impervious to all but Greek and Roman emotions, privately allow, in after-days, that they felt some trifling homespun regrets as the light-ship was caught in the eddies which tailed out from behind their steamships.

Gay-hearted commercial travellers, long since dead to the soft sorrows of parting, and who have made all the sly arrangements for creature-comforts for the voyage, by feeing the proper servants and getting the requisite liquors and seats and mattresses, and who have done all the neat tricks for bodily luxury which they alone know so well, look stonily on all sobs and tears, but nevertheless cannot repress a sharp pang at their severance from the delights of Broadway, which their present sight of the light-ship implies.

There is another class, a small one perhaps, but still a choice one, who gaze upon its dwindling shape with unmixed affection and gratitude. Since they saw it last, which date is also the time when they saw it first, they have spun well. They have twisted comfort and wealth from vast millions of threads, and are now returning to their dingy Dutch cities, or to the villa-covered Italian hills, or fossil and grimy English towns, there to sit down in ease, redolent of the republic, and therefore powerful aids to the political yeast now in the process of turning reigning dynasties bottom up. To such the light-ship is a painful point of departure. They feel they are closing a wide and hospitable door upon themselves as they pass by it, and they recall their struggles, which took place within it, as not unpleasant memories of a generous and fruitful land.

The light-ship itself seems to be always in motion, though, in one sense, it is always stationary. It has a happy knack of going many

more directions in a minute than any other known craft, Newfoundland fishermen included. There are to be found men whose internal organs appear to be fitted with gambrels, and, whatever is the motion of the vessel they happen to be on, they contrive to keep the balance and equanimity of a compass or a fore-castle-lamp.

If any one is in doubt regarding his own gambrels, the light-ship will assist him with a speed and exactness which will surprise him; for there are few human structures which can go so high or so low, or so far to the right or the left, or so much upon its back, or so little upon its proper surface, or so much upon its beam-ends, or its stern, or its bows, or can fly through the air more rapidly, or can strike the water with more force, or can shiver and plunge and rear and fall back again with greater celerity, than this particular craft.

On the calmest day that ever was, it seems as if forty thousand devils, each with a long bar and a leverage, were amusing themselves by tossing the boat about, and there was never a man who retained enough of his senses to describe her actions on a day of storm. In a thousandth part of an idea of an instant she can transform herself from a flying fish, or a balloon, to a deep-sea monster with no soul for air, or can threaten more capsize in more separate directions at once, than a man's brain is competent to realize.

In shape she is equally independent. She is modelled upon nothing, and bears a strong suggestion of every thing. She is like a Dutch shallop, without a poop, like a bread-tray, like a butter-boat, like a cook's mince-chopper, like a *chapeau bras*, such as La Perouse used to wear amid the cannibals, like a Turkish crescent, like a toadstool viewed sectionally. Still, nothing else but she, in her strong, powerful, well-braced frame, could fight the fearful battles which are thrust upon her almost daily.

Her burden is not far from two hundred tons. Her color, pink, has been mentioned before. It pervades every thing, her chains, boats, and all appurtenances. Upon her sides in huge letters is the legend in white, "Sandy Hook," denoting that it is at this particular spot that the tired perambulator of the seas may turn in, if he chooses, and enjoy the delights of the metropolis, a great deal in the manner in which a stroller on Broadway is directed into Bond or any other street by the sign on the lamp-post.

She is held in her position by mushroom anchors, and an arrangement of heavy frigate-chains, technically called a "a bridle." It would be hard to find a position more exposed than that in which she lies, yet she has broken from her moorings but twice. The first occasion was thirteen years ago, when, in the height of a dreadful storm, and in the dead of a black winter's night, she was forced inward upon the Hook, cased in ice, and wholly at the mercy of the tempest.

She brought up, however, just short of destruction, and no worse result ensued than the commonplace and very ordinary agony of a dozen men, frozen and maimed almost to uselessness, one of whom, Mr. James White, is now the first officer of the vessel, a worthy post, and most worthily held. In the second case the crew succeeded in getting her to sea, whence she returned when the storm subsided, and resumed her position.

Her deck presents very nearly the spectacle of that of any scrupulously-kept schooner, barring, perhaps, the singular tint of all the articles which encumber it. This seems a little incongruous in the case of a couple of twelve-pounders, whose warlike noises, however, are confined to salutes, the sorriest of which were fired upon the mournful advent of the Cambria, a few months ago. The deck is surrounded by a high bulwark, and is flush. Hints of the presence of danger stand about in the shapes of fire-pails and life-preservers, all of which bear the same inscription as the vessel to which they belong.

The distinguishing feature of the ship is, of course, the lights which it displays at night. For the accommodation of these, two short, sturdy masts are placed, strictly perpendicular, in the ordinary positions. Beside each of these, or, rather, aft of each, is another, but a slighter mast, designed for the use of the sails, should they, by any misfortune to the moorings of the ship, become necessary for the navigation of the vessel.

All four of these spars, and especially those which sustain the lanterns, are braced and secured in the strongest manner, as they have to endure no common shocks of the winds and waves. Forward of the foremast is a huge brazen bell, cast in Troy, whose time of use is in the thick fogs which sweep down and cover all things like clouds of snow.

Beside a stanchion farther back, is a board pierced with holes in horizontal lines, and supplied with pegs, and lettered in such a way as

to give information, at the end of each day, as to the number of vessels of different classes which have passed in or out of the harbor, and whose passage has been marked by the moving of the pegs by the watch on deck—a sort of nautical cribbage-board.

Below are very clean and warm quarters for the convenience of ten men, together with lockers containing cans of lard, oil, and the necessary stores of the ship, which are supplied at long intervals from government vessels attached to the light-house department.

The cabin, for the use of the captain and his mates, is very comfortably fitted and well ordered. Its very cushions contain welcome in their looks, and such welcome is often felt by pilots who come down with their charges, and who, being missed by the station-boats, whose duty it is to take them off, are compelled to sleep the night under the wing of the genial and musical captain who here is lord.

He is in command of a singular craft. To laymen it is first noticeable for its label and its color, and then questions are asked about the bulbous appearances upon the tops of the masts. To begin with: they are not bulbous at all, although they look so. They are two huge, flat, iron gratings of circular forms, dividing each other at right angles through their respective diameters, and which are fixtures at each mast-head. They have no other use than the very important one of distinguishing this vessel from all others during the hours of daylight. Seen at a distance, they resemble cages, uncomfortably used, in good old times, in just such bleak and stormy places, to expose the bodies of pirates to the mercies of sea-gulls until their warning and rattling bones clattered musically to the virtuous ear. Then, again, they look like the basket-hilts of swords, of which the stout masts are the trusty blades, which by some mishap have encountered this tough object and stuck in it, much like the result of the encounter of the cheese and the sword in the Yankee tradition of the days of Goffe and Whalley. By night these signs and signals are supplanted by the lanterns. Of these there are two, one for each mast, which are similar in construction and manner of display, and therefore the description of one will be all that is required.

Each lantern holds eight lights, which are arranged in a circle, and surround the mast. The cage is of copper and iron, has the requisite number of chimneys at the top, and is constructed in such a way that it is hoisted and lowered by a double winch upon the deck. Its diameter is in the neighborhood of five feet and a half, and its shape is octagonal, with glazings of heavy glass, twenty-five inches in height. The lamps are of French patent, and are, in every respect, fully equal to the demands made upon them. The oil is contained in brazen reservoirs, with which the burner is closely and ingeniously connected, and which, when ready for use, is slipped into a steel case swung upon gambrels. The lamps are brought from below, in cold weather, at the latest possible moment, and, being inserted in their proper places, are lighted from a little torch of copper, something of the shape of a toy flat-iron. The glass chimneys are then supplied, over and back of which are hung the reflectors, also swinging upon the gambrels. These last are brightly burnished, and are of the circumference of a large soup-plate, and have the shape of Mercury's helmet, barring the wings. The setting and lighting of each lamp being completed, the glass front is closed upon it, and the lantern is swung upon the mast until another comes to hand.

All the operation of preparing the lanterns for the night is carried on in small hutches with movable roofs, which are built at the foot of the respective masts, and into which the lanterns are lowered bodily.

Their elevation above the level of the sea is hardly more than forty feet, and yet their powerful radiance is observable for a surprising distance. Much trouble is incurred by the liability of the oil to congealation, and, although mixed with kerosene, it becomes unfit for use at 23° Fahrenheit. A method of supplying extra heat to the lanterns by charcoal-furnaces has been adopted, but still the fault is the occasion of much inconvenience.

The hours of sunset and sunrise limit the duties of these beneficent lights, while at the times of ten o'clock P. M., and two o'clock A. M., the lamps are replenished, and the lanterns go on duty again, to the creaking and clanking music of the iron cranks and chains which elevate them to their places.

Day in and day out the duties of the vessel are religiously done by the self-made prisoners, her crew, and few pleasures or changes creep aboard. Watches are kept with the precision of navy discipline, and talk is rare. Newspapers flit aboard at intervals of several days. Visitors are as scarce as goblins, and no new prospect ever turns up.

The sailors are eight in number, and are quite as likely to represent eight different nationalities as any less number, and perhaps more so. Their conversation is mostly syllabic, and poor and impoverished syllables at that. There is one man, a Swede, who has an accordion, on which he plays a negro melody, a psalm, a ballad, and a *pot-pourri*; but his companions hate them, and he sits with his back to them, dismally and mechanically stretching the instrument, and then squeezing it with the manner of a convict condemned to work a musical cat's-cradle for the rest of his life.

It is well for them that the vessel is accustomed to pitch them about. It reminds one of the misery of Dr. Pangloss, in his *pas deux* with his rascally relative, to see these sullen, spiritless, powerful fellows muffled up in reefing-jackets, sou'westers, tippets, and oil-cloth yellow helmets, and, with less vivacity of soul than the mummies of Pharaoh, forced to dance a Roger-de-Coverley on the resounding deck overhead, with all the skips, leaps, short runs, hops, and fancy touches of that most remarkable exercise.

Their lives are of the dullest, and those of their officers are but a whit more cheerful. The cabin of the ship is the sewing-circle of the nautical out-lying region. The village-store of the salty community is in the light-ship. Fat and unwieldy pilots grope aboard and unload their gossip and the tales and titbits of nautical scandal and criticism. The social complications and involvements of the neighborhoods of the Hook, and the Spits, and the Lights; the professional collisions of the vested and understood rights of the men of the brine; the distresses, the grievances, the disputes, the pullings and haulings of salts, captains, owners, and underwriters, are here gravely aired in jolly fellowship, and all with the politest respect for the feelings of everybody concerned.

Nobody ever heard a true pilot malign any one else; none can say, with his hand on his heart, that he learned from any man of the deep the smallest accusation against one of the cloth. If you want your hand well shaken, go to a pilot; if you are hungry, go to a pilot; if you want a character, go to a pilot; if there is any backsliding on the part of any sailor which you want proved, go to a pilot, and you will be surprised how misrepresented the unfortunate man has been. The first business of a pilot is to keep deep-water, and the second is to stand by every other pilot through thick and thin.

The sight of the light-ship by passers-by, its isolation, its restlessness, is always sure to provoke questions and comment. It is always picturesque, and clad in ice, in mid-winter, it is a startling thing to come upon. Its great hawse-holes, close down to water-mark, look like the villanous eyes of a cuttle-fish gazing downward at coming prey.

At night its huge lights, uneasy, swaying violently here and there, demand explanation as to what strange things they can be, and it is a disappointment not to find them supernatural. They glare about for miles, sometimes straight out to the horizon, sometimes at the sky overhead, and then, in an instant, at the waters by the very side of the ship. They yawn upon the clouds, and then cast a golden glow over the horrid surface of the torn and boiling waters.

Waves pitch upon the poor craft and bury it deep, but the lights stand out bravely. Foam and furious sheets of spray leap up like ghosts, swoop about the vessel, and vanish toward the Jersey shore upon the blasts of the east wind, but she holds her own. At times she is so held in the rush of the mountains of water, that she is motionless in all ways but in a throbbing quiver from her bow to her stern. In great gales she is wholly alone. Not an inhabited keel to be seen. Not a distant hill-top, not a ray of sun, not a breath of air, without its burden of bitter froth; not a second, without its gloomy, ponderous thunder, and not an inch of space above without its glare of lightning. No man sleeps, no man dares move. She is like an insect on the verge of Niagara, like a man single-handed in the disruption of a mountain, like an infant stemming a mob of furious giants, but still she clings and clings for days and nights; she goes through a purgatory of water, tempest, howling, darkness, tumult, and finally emerges, as she has done many times before, with the lanterns lit, but every thing else in ruin.

She is open to the worst of storms, and bears the sweep of the whole Atlantic, and was built, and placed where she is, to do it. A little weak admiration for her stumpy, homely personality, on account of strength and pluck is very common, however, and, if such unreasonable sentiments are ever to be allowed in any case, perhaps this is about as excusable as any.

ALBERT WEBSTER, JR.

THE MEDITERRANEAN ECLIPSE, 1870.

FROM "NATURE."

CLOUD in Sicily, cloud in Spain, cloud in Africa. Such at first sight might seem to be the only result of all the observations made on the eclipsed sun of 1870; such the reception given by Nature to those who wooed her as she had never been wooed before, who approached her full of the rarest gifts which Science has placed at man's disposal.

But, after all, has the oracle been silent? I think not. Dare we, however, say that the great problem of the Corona, that one among the many still outstanding difficulties which the eclipse was invoked to settle, is settled? This, perhaps, would be saying too much, but still, I think, a step in advance has been made. The oracle has spoken darkly, perhaps, but it *has* spoken.

This being premised, what is the result of the very few observations, comparatively speaking, which have been made? Before I attempt to give any idea of my answer to this question, it is only fair to myself to state that my only sources of information, up to the present time, have been conversations with some of the American members of the Sicilian expedition, a brief telegram from the members of the English party at Agosta, the Rev. S. J. Perry's communication to the *Daily News*, and an inspection of some drawings made by the officers of her majesty's ships off Aci Reale. At Catania we saw a portion of the corona for one and a half seconds through a cloud, and that was all; and the day after the eclipse, before the more fortunate members of my party returned, it became my duty to proceed to Malta in her majesty's ship Lord Warden, to attend the court-martial on the officers and crew of the beautiful but unfortunate *Psyche*, in which we had been wrecked, and the weather in the Mediterranean has been so bad that it was impossible to leave Malta in time to rejoin the expedition before they left for England. Of detailed information, therefore, I have none.

In the first place, then, I submit that the fact that the corona is a compound phenomena comes out in an unmistakable way. We have first of all a ring some 5' or 6' high round the moon, which almost all observers have seen alike; and then we have light beyond which some observers have seen of one shape and some of another, now stellate with many rays, now stellate with few, now absolutely at rest, now revolving rapidly.

This I think to be the key-note of all the observations with which I have become acquainted. I need scarcely say that it is exactly what had been predicted.

First among the fortunate ones who observed the corona with the telescope was Professor Watson, of Ann Arbor (Michigan), who took up his station at Carlentini, and appears to have been the best favored among the Sicilian observers. From his account I gather that there was an almost perfect *shell* around the sun about 5' high, and that outside this shell were less definite rays. What he was particularly struck with was this, that, as seen in the telescope, the rayed portion was most developed over the prominences, and, as I gathered from him in one case, the rayed portion was absent, as if a veil had been removed; so that he, at all events, is strongly impressed with the idea that the shell represented a true solar appendage, and that the rayed structure was due to our own atmosphere.

Next comes Mr. Brett, who, although he was not so fortunate, still was enabled to see and place on record some most interesting features, including the whole outline of the corona and even some of the protuberances. He also, as I am informed, saw the rayed portion of the corona most developed above the protuberances, the outline of the interior portion being visible, though not so strongly marked as in the case of Professor Watson's drawing, in consequence of less favorable atmospheric conditions. I am thankful to say that the weather at Syracuse enabled Mr. Brothers to obtain some admirable photographs, which I have not yet seen. These are among the most important results of the expedition.

Next I must mention Professor Peirce, the head of one of the American parties, who observed two miles north of Catania, at a private casino of the Marchese Sangiuliano. I believe that he also saw the shell, but of this I am not absolutely certain; but he distinctly observed that the outer corona over the prominences was rosy red, although he did not see the prominences himself. A more beautiful proof of the terrestrial nature of this portion of the corona it would be difficult to imagine: for, of course, at the sun, the hydrogen, which thus tinged it, is incapable of coloring any thing, as its own light is absorbed by the transcendent brilliancy of the photosphere; while nothing would be more natural than to suppose that the light, which, in its own atmosphere, should strongly tinge any thing radially illuminated, should be that of the prominences.

But the strongest proof of the variability of the outer portion and of the constancy of the inner portion is afforded by the observations made on board the small fleet attempting to save the *Psyche* off Aci Reale, where the eclipse was observed in unclouded splendor. Here were the iron-clads Lord Warden, Caledonia, and Royal Oak, and the tugs Weasel and Hearty, besides the Italian gunboat Plebiscito, all

within a stone's-throw of each other. In all the drawings, and many have been received, we have a ring 5' or thereabouts, while the outer portion is as variable as may be. On the same deck, that namely of the flag-ship Lord Warden, two drawings were made, one by Captain Brandreth, and the other by Dr. Macdonald, F. R. S., in which the variation is so strong that one would feel inclined to acquit the atmosphere of any participation in the matter, and to relegate the whole outer corona to subjectivity alone, did not Mr. Brothers's admirable photograph show both phenomena, as I am told they do. Dr. Macdonald saw eight rays arranged with perfect symmetry; Captain Brandreth saw only two elliptical hoops crossing each other at right angles.

Captain Cochran, of the Caledonia, besides the ring, saw a complicated stellate figure, the rays of nearly equal length; while Mr. Dexter, at sea between Catania and Syracuse, saw, besides the ring, *only one ray* of inordinate length.

So much for the drawings. I think that if the records of former eclipses be now examined, especially Mr. Carrington's drawing of the eclipse of 1851, and compared with the others taken at the same time, additional evidence will be gathered in favor of the compound nature of the corona, which, on the evidence now before me, I consider the great teaching of the present eclipse. Our experience in Sicily seems to be similar to that of the Spanish observers, for Mr. Perry writes that "some observed two curved rays," while the rapid degradation of light occurred at one-fifth of a solar diameter, but, so far as I know, no one in Sicily was favored with a view of the dark intervals which were observed in Spain.

There is a strange and most interesting discordance between some of the spectroscopic observations made in Sicily and Spain. At Agosta, where the totality was well visible for ten seconds, Mr. Burton detected a green line near E, with a tangential slit (distance from moon not stated). This line, which was also seen by the Italian observers, is doubtless the one recorded last year by the American astronomers, but in Spain Mr. Perry states that bright lines at C near D, δ (or E) and F were observed 8' away from the sun. At Syracuse Professor Harkness, whose telescope was moved into the various positions by Captain Tupman, R. M. A., found the green line in all parts of the corona, so far as about 10' from the sun, and at one point thought he detected two green lines, less refrangible than it; but at several places he saw a complete hydrogen spectrum (including C), which he attributed to prominences, until he was informed by Captain Tupman that there was no prominence near the slit—more proofs of the terrestrial nature of this portion of the corona, I think, taken in connection with the fact that *the dark moon gave identically the same spectrum*. It would appear that there was so much atmospheric reflection in Spain, and here and there at Syracuse, that the true coronal spectrum with its line near E, the existence of which we must now accept as established beyond all question, was partially masked by the prominence spectrum with its usual well-known lines. There is one passage in Mr. Perry's interesting letter in which, if there be a misprint, as I suspect there is, an observation of great importance is recorded. It runs: "Mr. Abbay, observing at Xeres with a spectroscope of two prisms of 45° belonging to Professor Young, saw the bright lines C, D, F, and afterward F and a line rather more bright than F on the less refrangible side of B, C not noticed then." Now, if δ (not B) was intended here, we have sub-incandescent hydrogen mixed with the green-line-giving substance, which may probably be a new element with a vapor density less than hydrogen.

So that roughly we might regard the chromosphere to be built up of the following layers, which are in the orders of vapor density in the case of known elements:

X' (New element)	Green coronal line.
Hydrogen	{ Sub-incandescent . . . F.
	{ Incandescent . . . C, F, near G, h.
X (new element)	Near D.
Magnesium	{ δ and lines in blue.
	{ and violet.
Sodium	D.
Barium.	Several lines.
Iron, etc.	{ Several lines, including E.

The foregoing table excludes naturally the substance or substances which give bright lines in the solar spectrum, which are at times visible in the spectrum of the chromosphere. I have ventured to suggest that the substance which gives the line in the green is a new element, because invariably I have found that in solar storms the chromospheric layers are thrown up in the order of vapor density, and because all the heavier vapors are at or below the level of the photosphere itself.

With regard to the question of polarization, the parties in Sicily obtained evidence that the corona was radially polarized, though Professors Harkness and Eastman obtained a result which they explain differently. Mr. Ranyard, at Villamonda, and Mr. Peirce, Jr., north of Catania, obtained identical results in favor of strong polarization. Hence the solar corona, accepting these observations, not only radiates, but reflects solar light to us. A careful consideration of this fact, taken in connection with the possible addition of a, so to speak, terrestrial corona to its light, may enable us to account for some of the observations, both polariscopic and spectroscopic, which do not at first

appear to harmonize with those to which I have referred, notably those which give a pure continuous spectrum to the corona, and which state that its light is only slightly polarized.

From what has preceded, then, we seem justified in suggesting as working hypotheses the following, which, however, more accurate information may alter, and which I offer as suggestions only, *bien entendu*.

1. The Solar Chromosphere extends some 5' or 6' from the sun (Watson and others), its last layers consisting of cool hydrogen (Mr. Abbay), and possibly a new element with a green line in its spectrum (Young, Burton, and others); which line, if it be identical with the auroral line, as stated by Gould, may possibly be present in the higher regions of our own atmosphere.

2. Outside this stratum the rays, etc., are for the most part due partly to our own atmosphere, partly to our eyes, for their shape varies; they are seen by some at rest, by others in motion, and their spectrum is the same as that of the dark moon (Maclear).

3. The white light of the chromosphere above the prominences, as seen in an eclipse, is due to its strong reflection of solar light, as shown by the polariscopic observations (Ranyard, Peirce, Jr., Ladd).

4. The rosy tinge of the corona proper, that is, of the region more than 5' or 6' from the sun, is due to our atmosphere containing light which comes from both the higher and lower strata of the chromosphere (Peirce, Sen., Maclear, Abbay).

J. NORMAN LOCKYER.

UNDER THE MAPLES.

I.

UNDER the maples sat Jenny and I,
Ever so many years ago,
Watching the streamlet murmuring by,
And gurgling a love-song in its flow;
And fleecy clouds, in a phantom troop;
Scudded across the bright-blue sky,
While our hearts were weaving, in many a loop,
A mesh for the lives of Jenny and I.

II.

It seemed not strange that her tiny hand
Should nestle so trustingly fond in mine,
And her auburn ringlets' gold-brown strand
My clumsy fingers like silk should twine;
And right it seemed that her bright young head
Should find a pillow upon my breast,
As the clouds, in gold and purple and red,
Sank royally down in the far-off west.

III.

For I that old, old story had told—
The story of anxious hopes and fears—
While over her ringlets' dark-brown gold
Was falling a shower of pearly tears—
Tears that hung on her eyelids' fringe
Like dew on the fresh-born buds of May—
And her blushes deepened their roseate tinge,
As I tenderly kissed those tears away.

IV.

Her heart was mine, though her lips refused
To utter that longed-for syllable, "Yes;"
But musing she sighed, and sighing she mused.
What meant her sighs and her musing—guess?
But then we pledged by the streamlet's flow,
As the stars peeped out from the twilight sky,
Ever so many years ago,
Under the maples, Jenny and I.

V.

There are frosty streaks in the auburn hair
That I twined round my fingers years ago,
And the brow of my wife may be less fair
Than it seemed in that sunset's ruddy glow;
But I know, when I clasp her to my breast,
There's a wilder thrill than in days gone by,
When the clouds sank royally down in the west,
As under the maples sat Jenny and I.

SALLIE A. BROCK.

TABLE-TALK.

BEFORE this number of the JOURNAL reaches its readers, the firm of D. APPLETON & Co., by whom it is published, and whose name it bears, will have removed from Nos. 90, 92, and 94, Grand Street, to Nos. 549 and 551 on the west side of Broadway, between Prince and Spring Streets. We believe this is the eighth removal made by this eminent publishing-house since it was founded, nearly half a century ago, by Mr. Daniel Appleton, father of four of the gentlemen who now compose the firm, and grandfather of the fifth and youngest member. The founder of the house, a man of remarkable sagacity and energy, was born at Haverhill, Massachusetts, in 1795, and died in this city, March 27, 1849. He commenced business at an early age in his native town as a general store-keeper, removed for a while to Boston, and finally settled in New York. His first place of business in this city was in Exchange Place, in the rear of the present Custom-house, which was then the Post-office. Here in due time his eldest son, Mr. William H. Appleton, who is now the head of the firm, became, while yet a lad, his father's assistant, and subsequently his partner. A little book called "Daily Crumbs" was the first publication of the house, the mere titles of whose books now fill a volume, and whose presses now send forth annually several million volumes. The first removal of the firm was from Exchange Place to the building then known as Clinton Hall, in Beekman Street. The second removal was from Beekman Street to No. 200 Broadway, on the west side between Fulton and John Streets. This location was considered in those days to be rather too far up-town for retail-trade, though now the chief centres of that trade are two miles farther up. Here the firm had a store twenty-two feet wide by fifty feet in depth, which was then considered large. Here many of the publications which have contributed so much to the success of the house first saw the light. Prominent among these was Ure's "Dictionary of Arts, Manufactures, and Mines," which had great and deserved popularity. Editions of the Prayer-book of various sizes, of Byron and of Moore, and of "Tales for the People," in twenty-five volumes, were also remarkably successful. A third removal of the firm, which, however, was hardly more than an episode, was made at this time across Broadway to the corner of Dey Street, where the house remained several months while they were rebuilding and enlarging the store at 200 Broadway. When that was reconstructed, they moved back again, which may be considered the fourth removal. Six or seven years later they bought and removed to the Society-Library Building, on the east side of Broadway, between Leonard Street and Catharine Lane, which was then one of the prominent edifices of the city. It was subsequently destroyed by fire, and on the site now stands the costly and magnificent marble building of the New-York Life-Insurance Company, one of the finest structures in the country. Here they commenced the publication of their greatest work, "The New American Cyclopædia." Before the building

was burned, D. Appleton & Co. made a sixth removal to the fine marble edifice on the west side of Broadway, Nos. 443 and 445, where they remained eight years, and where the publication of the Cyclopædia was completed, in sixteen large volumes, and "The Annual Cyclopædia" begun. In 1868 they made a seventh removal to Nos. 90, 92, and 94, Grand Street, at the northeast corner of Greene, where they erected and occupied a building one hundred feet in length, seventy-five feet wide, and five stories high. Here the JOURNAL was commenced, in April, 1869. Even this huge edifice proving inadequate for their ever-increasing business, they have made an eighth, and, we trust, a last removal, to Nos. 549 and 551 Broadway, one of the most conspicuous and eligible sites on the great thoroughfare of the city. The building they occupy is two hundred feet in length by fifty in width, and is six stories high, besides basement and sub-basement. Each floor covers a space of nearly a quarter of an acre in area. In this store upward of one hundred persons are constantly employed, though the printing and binding of the firm are done altogether in another vast establishment in Brooklyn, covering an acre and a quarter of ground, and where about five hundred persons are employed.

— It is surprising that, while we in New York are vexing ourselves so ceaselessly about our crowded city, and the need of new and swift methods of transit, by which we may reach the outlying spaces around us, there should be at our very hand the means of nearly doubling our present population without increasing the area of the city, and yet without inconveniently packing the inhabitants. We can all of us absolutely live in a district of pure air lying within immediate reach of our business, and to attain which neither car-drivers nor conductors need vex or trouble us. Why should we not populate the pure, sweet air of the sky-stories above us? All along Broadway, for instance, business requires but three or four stories; if the buildings have more lofts than these, they are either vacant or employed for storage. Now there is no reason why the buildings in Broadway should not be constructed upon a plan that would give two or three upper floors for residences. The utmost elegance, the completest privacy, and entire accessibility, can be secured for apartments thus arranged. The buildings, of course, should be entirely fire-proof. The rooms should be provided with every modern convenience for housekeeping, and steam-elevators should afford the means of rapid and unlaborious access. "One of the most charming homes I visited while in London," remarked a gentleman to us once, "consisted of numerous rooms directly under the roof of a large six-story building. Here a wealthy family were residing, surrounded with every elegance. They had their billiard-room, their charming dining-room and parlors, their wine-room, and they were lifted above the confusion, the bad air, the nuisances and disturbances of the street. The only drawback was the necessity of climbing up the six long stairways." One has only to reflect a little to see how charming residences thus situated could be made. The buildings

ought to be fully eight stories high, and the highest story would be the most desirable. But any story above the fifth would reach an altitude where it would be rare in the warmest weather not to experience pleasant breezes, and where the air would come refreshing and delicious either direct from the sea or from the Hudson hills. Gardens could be planted on the roofs of these buildings, affording, in cool twilights and on summer evenings, delightful promenades. This method of building would permit certain of the rooms to be lighted from above by skylights—and light received in this way has a peculiar charm. It comes soft and even, with no confusing cross-lights, and is very soothing in effect. Pictures are better, and all objects more agreeable to the eye, under such a light. In these high sky-homes there would be a sense of delicious serenity—a sweetness, repose, and beauty—that only those who have visited people living in this way can fully understand. The unobstructed heavens seem to come down to you. The air is exhilarating, and the whole aspect of the apartments singularly agreeable. There are innumerable people fond of metropolitan life, who now are of necessity banished into dreary neighborhoods of cabbage-gardens and potato-plots, who would delight in the opportunity of living in wholesome air and under agreeable conditions, where they could also enjoy libraries, picture-galleries, lectures, the opera, concerts, the theatre, the clubs, and all the animation and stir of a gay metropolis. To some tastes suburban residences have no charm. Women especially are apt to be oppressed by the dulness and monotony of country-life. They like the bustle of a city, the exhilarating contact of crowds. Of families whom pressure has driven into our outlying villages, a large number would, it is certain, prefer life in the heart of the city if it could be enjoyed there under suitable conditions. The experiment we suggest should be tried, but a movement of the kind must be inaugurated properly if it is going to be a success. Half-way attempts will not do. Simply ordinary residences over stores is not what we mean; these exist abundantly in some of the avenues, and serve their purpose very well. Nor do we mean costly hotels, such as those just completed in Fifth Avenue, in which suites of rooms cost more than whole houses elsewhere. If some of our capitalists would secure an entire square on some good street, and put up an eight-story, fire-proof building, the four lower stories reserved for trade, and the upper ones constructed for families, having all modern arts and conveniences, the family-entrances on the side-streets, or entirely separated from the business-entrances, we should then have a good illustration of how the splendid sky-spaces that now remain unutilized might be made delightful homes.

— Iron, when used in architecture in imitation of stone, is an abomination. No dexterity in painting it can give it the texture or quality of stone, and the imitation is always offensively apparent. But iron used as iron, in accordance with rules and after methods derived from its special nature, is quite another thing. We have, in Broadway, many iron fronts constructed after stone

models, and painted to look like marble, but we have only one that distinctly obeys the law of its own material. This is a new building, of which it might be charged that we should say little, inasmuch as we occupy it; but, as its construction and decoration are the ideas of the architect's, and not ours, we may be pardoned for extolling it. The front consists of slender iron columns, which are painted in a neutral tint and picked out with gold. The effect is light, spacious, and graceful. There is no need in an iron building of the massiveness of a stone building; and as the massiveness which in marble or granite gives so much dignity to a structure, in iron presents nothing more than so much greater surface of paint, it should never be imitated. The qualities that iron permits are grace and lightness, and it should always be used to secure these ends. When Mr. Paxton modelled the Crystal Palace it would have been absurd, indeed, if he had kept in view the stone idea of a building; he succeeded in producing a graceful structure by perceiving the special qualities of iron and glass. Iron admits of elaborate decoration, of tints and colors, which in stone would be atrocious. The ornamental front of the building we have mentioned possibly startles somewhat the prejudices of those who assume that brick and stone give the law to architecture. But these critics forget our own Crystal Palace, with its many-tinted columns, which was so much admired. Iron has only recently come much into use in architecture, and it is not surprising that at first it should have been employed simply as a substitute for stone; but its adaptability for another kind of building begins to be seen. Uniting strength with lightness, it is possible to use only slender columns in the strongest of buildings, and thus greatly increase the illuminating space. Half the business warehouses in New York are imperfectly lighted, whereas, if constructed after the method we have described, this defect would have been avoided. This great practical advantage ought to be sufficient to largely introduce the new plan; and hence we have no doubt that Broadway is destined to undergo another great change in its architecture. Ere many years it will be as resplendent as a fairy palace, lined with light aerial structures, gay with color and glittering with glass—a street of crystal palaces.

— The statement of Mr. Charles Francis Adams, that the American people cherish an undying hatred toward England, finds occasional corroboration in the actions of our leading politicians. Nor do we here refer to congressional resolutions in favor of Fenianism, nor to the national anger at Alabama depredations: we go back to a generation just passing away. No man better appreciated England and her institutions than Daniel Webster, and yet he was unwilling to be known as one who would publicly praise her. When Mr. Clay was nominated for the presidency for the last time, a mass-meeting was arranged in Boston, on the Beacon-Street side of the Common. An open-air stand was erected for the speakers, and Mr. Webster was asked to preside, and to open the meeting with a speech. It was a pleasant, sunny day, and all Massachusetts was there to do honor

to the occasion and the nominee. As far as the voice could reach from the stand, nothing could be seen but a dense mass of expectant hearers. If we recollect aright, England had just taken one of our fishing-vessels in her waters, and the Democracy were loudly declaring that, if they succeeded in the coming canvass, neither England nor any foreign power should dare to touch an American citizen. As Mr. Webster slowly arose to address the vast audience, a man in the crowd attempted to catch his eye or ear, throwing up his hands, and exclaiming: "Mr. Webster! Mr. Webster!" Cries broke out all around: "Stop your noise!" "Shut your mouth!" etc. But Mr. Webster quietly turned toward the intruding voice with: "Well, sir, what is it?" "I want to know, Mr. Webster, if England or Canada take one of our citizens and put him in their jails, will Mr. Clay, if elected, take him out again, if he has to go to war for it?" "Certainly he will, my friend; I pledge you that." "Then," said the interrupter, "he gets my vote anyhow." Cries here again broke out: "Good for you!" But just then a voice exclaimed: "The English are all slaves!" Mr. Webster's face wore an expression of the deepest scorn, as, shaking his finger in the direction whence the voice came, he exclaimed: "The English all slaves! My friend, where did your fathers come from?" And then, looking slowly around, he impressively continued: "All our best civil rights—the trial by jury, the franchise, the free press, the law of libel, the common law—all, all came to us from England." Then, as if recollecting himself, he turned to the reporters just behind him, and said, *sotto voce*: "Don't put that in the papers to-morrow, gentlemen." He thus unconsciously bore witness to the unpopularity of being known to be a supporter of England. But the reporters disobeyed him: the papers of the next day contained his remarks in full.

Art Notes.

Ruskin on Landscape.

PROFESSOR RUSKIN has delivered, at Oxford, the first of three lectures on "Landscape."

Landscape, he pronounced, is the thoughtful and passionate expression of those physical phenomena which relate to human life, and displays such human methods of dealing with them as are either exemplary, or deserving of sympathy, or provocative of emotion.

Its main interest is never to be found in the mere water, or land, or sky, however beautiful they may be. It is a great mistake to suppose that a great painter ever inserts figures merely for the sake of variety. All the interest of a landscape must bear some relation to figures past, present, or future, or to some form of human action. There is no more sublimity in mountains *in themselves* than in level plains: their interest attaches to them as places which man can climb, or where he can be dashed to pieces. A cloud is *itself* quite unworthy of being painted: its value in landscape is derived from its being a means of nourishment or chastisement to men, or the dwelling of imaginary beings. Turner painted sky, not as a thing beautiful in itself, but as

telling sometimes of an impending storm, sometimes of coming sunshine after stormy weather, and the wind and storm and sunshine were to him only of importance as affecting the welfare of men. To gather together splendid physical phenomena for the sake of the momentary sensation on the spectator is not the object of true landscape. There is a well-known American painter who seems to make this his aim. He may be a skilful imitator of Nature; but he is not, in the true sense, a landscape-painter. One of Turner's best landscapes represents Ecclestone in Yorkshire: its subject is a mere bank of grass, with some trees and ruins upon it, and some water in the foreground. Of such a scene in America, or a country without a history, no mortal could ever have made a landscape. There is nothing of essential landscape scenery in it, in the sense in which it is commonly understood. It derives all its interest from its relation to human life. There is just a strip of wild copse-wood; there are the ruins of a great abbey, fading out of sight as out of time: these take you back into past centuries. On the other hand, there are out-houses turned into a house, and the mistress of it standing at the door; there is a water-mill at work, and cattle by the side of the mill-stream: these tell of modern life in a quiet, peaceful form. We also see the white smoke rising from the chimneys (which shows that it is not in a coal-country), and a boy cutting fagots for the hearth, and clothes laid out to dry, and other clean white clothes hung over clean white stones: all this tells a tale of simplicity and purity and cleanliness, though in the midst of ruin and sadness. It is essential to landscape-painting that all should be compassionately and tenderly done, with deep feeling and sentiment. Without strong passion and sensitiveness men can never paint well. Particularly in landscape the material influence of physical phenomena is so strong that, to rise above it, a great deal of sentiment is necessary. Much more strength and heart is necessary to paint landscape well than it is to paint the human form; none but the strongest men—Titian, Velasquez, Turner, etc.—can attain to it. In landscape-painting, as in all art, the first thing is to be quiet, calm, and modest. It is essential that the painter should like the landscape he is going to draw better than his own sketch of it. His thought must be, *not*, "What a good picture it would make!" but, "If only I could get some straw of such a scene to carry away!" His one idea must be, *not*, "How can I make a pretty picture of this scene?" but, "How can I give a person who has not seen this place a good idea of it?" To place the spectator, as it were, in the original scene, is the aim of all true art.

The trustees of the National Portrait Gallery have purchased the portrait of Charles Dickens by Ary Scheffer. It was painted in 1855, when he was forty-three, and exhibited at the Royal Academy in 1856. The countenance is vigorous, with deep-brown hair, a happy medium between the showy youth with exuberant locks, as painted by Maclise, and the rugged countenance, with grizzly beard, of his latest period. The face is seen in three-quarters, looking over his left shoulder. The hands are joined on the opposite side.

The ex-president of the Academy of Chili, who is now in London, claims to be the "swiftest painter of the age," and challenges any English artist to a painting contest for five thousand dollars a side, the performance to take place in public and the spectators to decide the wager by ballot, the stakes to be

awarded to the artist who shows the most rapidity and excellence.

An important artistic discovery has just been made at Reichenbach, in Silesia. A portrait of Luther has been found, buried under a heap of rubbish in the passage leading from the Lutheran church. The canvas is in a perfect state of preservation, and has been recognized by a burgomaster, a well-informed amateur, as the work of Louis Cranach.

Miscellany.

Bavarian Laws.

IN Bavaria the laws provide that any person who sells food or drink, knowing them to be adulterated with substances injurious to health, is liable to imprisonment for two months, and may in addition be fined one thousand florins (eighty-three pounds six shillings and eight pence). Likewise, any person who adulterates food and drink with substances injurious to health, knowing that they are to be offered for sale, is liable to an imprisonment of two years, to which may be added a fine not exceeding four hundred florins. But, if the adulterated substances are not injurious, the punishment is simple arrest or a fine of one hundred and fifty florins. Tradesmen or wholesale dealers in whose premises materials for adulteration or adulterated food itself are found are liable to the punishments detailed above.

Some stringent municipal regulations prevail respecting the sale of bread, beer, and milk, at Munich. Every kind of bread exposed for sale by bakers or eating-house keepers is liable to inspection by specially-appointed persons, and all bakers and dealers are obliged to allow the inspectors free access to their shops and business premises generally. The inspection commences at six o'clock A. M. in the summer and at seven A. M. in the winter. Both quality and weight are examined. All bread which is burned, under-baked, which has not the proper admixture of salt, which is not made of the right kind of flour, or which appears to be in any way unwholesome, is liable to be seized, as well as all loaves not of the proper declared weight, i. e., in which the deficiency amounts to more than half an ounce to an ounce in the pound (according to the weight of the loaf), although an allowance of double this deficiency is made for bread more than twenty-four hours old. Any infraction of these regulations is punished by a fine not exceeding twenty-five florins (two pounds one shilling and eight pence).

Retailers of beer are not allowed to charge a higher price than that which is fixed for the time being by the official beer-tariff. If from any special causes they have permission to sell at a lower price than at that of the tariff, the official document granting this permission must be exposed in a prominent place on the premises. In those localities where special or fancy descriptions of beer—such as "Bock" or "Salvator," to which the tariff does not extend—are sold, a table of prices must also be hung up. All beer must be duly served in stamped measures or jugs, and the use of beer-fountains is prohibited. Beer which has been left by the guests in their glasses must not be returned to cask or be again served to customers. Beer intended for sale, together with the measures in which it is served, is under the supervision of the municipal inspectors. As in the case of bread, a fine of twenty-five florins punishes infractions of these regulations.

Milk is not allowed to be hawked about, and can only be sold by cow-keepers or dealers at their shops or in the markets. This is not intended, however, to prevent its being sent to customers' houses from the dairies. Only wholesome, clean, and unadulterated milk is allowed to be sold, and it must be kept by dealers in wooden, earthenware, or well-tinned iron vessels. The measures used for selling it must be duly stamped. All milk is subject to inspection, together with the premises in which it is kept, and to facilitate this all milk-dealers are bound to give notice of their intention to commence business. Each name is entered under a special number in the municipal register, and the number and name of the dealer must appear over his shop-door. The selling of adulterated milk is punishable by confiscation of the milk and a fine not exceeding one hundred and fifty florins, which punishment is increased in cases of adulteration with material injurious to health by imprisonment for a term up to two years. In aggravated cases the fine may be extended to five hundred florins. Other infractions of these regulations are punishable by a fine of twenty-five florins, to which may be added three days' imprisonment.

The Decay of Empires.

The majestic shades of old Assyria, Babylonia, and Persia, move like phantoms across the dim spaces of ancient history. That they flourished for a while, and then lapsed into obscurity, we know from many records; but the causes of their fall remain undisclosed. They had, probably, no principle of cohesion beyond the temporary success of some great military family; and, when that came to an end, as in the cases of Sardanapalus in Assyria, and Belshazzar in Babylonia, the whole empire dissolved into chaos. Those two mighty agglomerations of varied nationalities split up into fragments when their respective capitals were destroyed, and their military strength overmatched. The ruins of their palaces and temples have been unearthed in our own days; but we still know little, and shall probably never know much, of the general social condition which existed beneath the magnificence of royalty, and the splendor of aristocratical and priestly castes. Doubtless there was a background of poverty and discontent behind the glittering pageantry; for Dives always has his Lazarus at the gate. But wretchedness possesses few means of perpetuating the memory of its sufferings, and the relics of the past show little but the pride and pomp of Eastern courts, and nothing of the accompanying misery which may have contributed to their fall.

The decay of the Roman Empire is within the broad light of history. It proceeded not so much from bad laws—for the laws were better than those of any other ancient state—or from tyranny (for, when once a nation had submitted to the imperial eagles, the Roman rule was fair and impartial), as from the sheer impossibility of permanently holding together such a vast accumulation of distinct countries, and so many widely-different races. Rome trained and nourished a number of nationalities, some of which, in time, surpassed her in strength—at least, on their own ground. As the future nations of Northern and Western Europe grew from youth to maturity, Rome herself was passing from maturity to decrepitude. The governing classes became effete with long prosperity, with the traditions of dominion, and the routine of power. Indulgences in sensual pleasures sapped the forces of the state, and a soldiery, devoid of the principle of citizenship, became the masters of those whom they affected to serve. Yet for how long a period did the

Roman Empire last; and what a grand, and, in many respects, beneficent fact it is in the history of the world! That City of the Seven Hills spread the civilization of Greece over half the globe. We are her debtors, and build upon the solid concrete which she spread so many centuries back. When she failed, it was not by any sudden collapse, but by the slow decay of age; accelerated, it may be, by those vices which were inherited from her days of haughty strength and youth. The decline of Rome was like the twilight of a midsummer day—long, luminous, regretful, passing into darkness by soft degrees and infinite modifications of decay, and not seldom kindling into fresh flushes of vanishing glory before the coming of the night. And that the dark ages were not utterly dark, was owing in the main to the light reflected in many places from the sunken empire.

The Eye of an Eagle.

The eyes of all birds have a peculiarity of structure, which enables them to see near and distant objects equally well, and this wonderful power is carried to the greatest perfection in the bird of prey. When we recollect that an eagle will ascend more than a mile in perpendicular height, and from that enormous elevation will perceive its unsuspecting prey, and pounce on it with unerring certainty; and when we see the same bird scrutinizing with almost microscopic nicety an object close at hand, we shall at once perceive that he possesses a power of accommodating his sight to distance in a manner to which our eye is unfitted, and of which it is totally incapable.

If we take a printed page, we shall find that there is some particular distance, probably ten inches, at which we can read the words and see each letter with perfect distinctness; but if we move the page to a distance of forty inches, or bring it within a distance of five inches, we shall find it impossible to read it at all. A scientific man would, therefore, call ten inches the focus or focal distance of our eyes. We cannot alter this focus except by the aid of spectacles. But an eagle has the power of altering the focus of his eye just as he pleases; he has only to look at an object at the distance of two feet or two miles in order to see it with perfect distinctness. Of course the eagle knows nothing of the wonderful contrivance which God has supplied for his accommodation; he employs it instinctively, and because he cannot help it. The ball of his eye is surrounded by fifteen little plates, called sclerotic bones; they form a complete ring, and their edges slightly overlap each other. When he looks at a distant object, this little circle of bones expands, and the ball of the eye, being relieved from the pressure becomes flatter; and when he looks at a very near object, the little bones press together, and the ball of the eye is thus squeezed into a rounder or more convex form. The effect is very familiar to everybody; a person with very round eyes is near-sighted, and only sees clearly an object that is close to him; and a person with flat eyes, as in old age, can see nothing clearly except at a distance; the eagle, by the mere will, can make his eyes round or flat, and see with equal clearness at any distance.

Charles Lamb.

Of Charles Lamb personally, of his dress, his style, his conversation, we know more than we know of any of his contemporaries. His slight, spare figure, his spindle legs—Tom Hood said they were immaterial—his head, which Leigh Hunt said was worthy of Aristotle, his pile of forehead, his curved nose, his hazel eye, sparkling with wit, and his half-playful, half-melancholy smile, have been noted

in a dozen sketches; and, with the help of these, nothing is easier than to picture to ourselves the author of the "Essays of Elia," in his black dress, the proper costume, as he thought, of an author, with his shuffling gait—"a compound of the Jew, the gentleman, and the angel"—hurrying along Cheapside and Fleet Street from the India House to the Temple, between four and five in the afternoon, looking in at the office of Barry Cornwall or of Talfourd to stutter out an invitation to supper, to play a rubber of whist, to smoke a pipe, and to hear Coleridge talk metaphysics over a glass of grog, or Wordsworth recite his poetry under the inspiration of a glass of water. And those pleasant social gatherings of his in his Temple chambers, how vividly they reproduce themselves as we glance through the pages of Elia! His low-roofed rooms, in Inner-Temple Lane, with their smoke-begrimed ceilings, their prints of Titian, Leonardo da Vinci, and Hogarth, in black frames, his old high-backed chairs, and his long, plain bookcases filled with moth-eaten folios of Shakespeare, Ben Jonson, Beaumont and Fletcher, all tossed together, are as well known to us as the furniture, books, and pictures of our own rooms; and the imagination, without an effort, repeoples these rooms with the old familiar forms: Coleridge, with his splendid head, his large gray eyes, and his musical voice, looking, as Lamb said, like an archangel a little damaged; the tall gaunt form of Wordsworth, with a green shade over his eyes; Godwin, the author of the most sensational works of his day, with his thin voice and finical manners, but with a head that Phidias might have chiselled; Tom Barnes, the editor of the *Times*; Hazlitt, with his critical, contentious tongue and his slouching gait; Leigh Hunt, with his flowing locks and his benevolent smile; the gaunt form of George Dyer; Charles Kemble, with his majestic air, Talfourd, The Crabb, Liston, Burney—the Burney whom Lamb has immortalized by his *mot*—"If dirt were trumps, what a hand you would have, Michael!"—and Mary Lamb, with her old-fashioned dress and her capacious cap, the very soul of good-nature, looking with a half-humorous, half-reproachful expression at her brother as he lays down his cards to mix his second tumbler.

Weight of Women.

In romance, even of this modern day, we read constantly of heroes magnanimously rushing off with fainting maidens from blazing houses, or more feloniously "carting" them on their shoulders for purposes of revengeful abduction. Let any one out of training, or under six feet high, and with proportionate strength, attempt to run away with a fairly well-composed girl of eighteen or twenty, and give us his opinion of the prowess of these vaunted knights. A woman weighing one hundred and forty pounds' weight of kicking womanhood is not to be carried at all. Even a slight girl will weigh a hundred pounds, and Rudolph or Horatio will stagger under her lovely but cumbersome figure, if he break out of a *staccato* walk. There are plenty of buxom girls who weigh up to a hundred and seventy pounds, and it is not given to every man to "hurry off" with such a baggage. When the victimized Squallina faints on the stage, the robust baritone takes care that the *évanouissement* shall be accomplished as close to the wing as possible. He knows what La Squallina weighs by the sad experience of rehearsals. Let any of our readers carry his sister (he will probably prefer his cousin) up three flights of stairs, without stopping, and forward to us his sentiments on the occasion. Women weigh a

good many pounds nowadays, and their airiness of fabrication is a fallacy.

The Portrait of Poe.

BY SARAH HELEN WHITMAN.

Slowly I raised the purple folds concealing
That face, magnetic as the morning's beam;
While slumbering memory thrilled at its revealing,

Like Memnon waking from his marble dream.

Again I saw the brow's translucent pallor,
The dark hair floating o'er it like a plume;
The sweet imperious mouth, whose haughty valor

Defied all portents of impending doom.

Eyes planet calm, with something in their vision

That seemed not of earth's mortal mixture born;

Strange mythic faiths and fantasies Elysian,
And far, sweet dreams of "fairly lands forlorn."

Unfathomable eyes that held the sorrow
Of vanished ages in their shadowy deeps,
Lit by that prescience of a heavenly morrow
Which in high hearts the immortal spirit keeps.

Of has that pale poetic presence haunted
My lonely musings at the twilight hour,
Transforming the dull earth-life it enchanted,
With marvel, and with mystery, and with power.

Of have I heard the sullen sea-wind moaning
Its dirge-like requiems on the lonely shore,
Or listened to the autumn woods intoning
The wild sweet legend of the lost Lenore.

Of in some ashen evening in October,
Have stood entranced beside a mouldering tomb

Hard by that visionary Lake of Auber,
Where sleeps the shrouded form of Uhlume.

Of in still, starlit nights have heard the chiming
Of far-off mellow bells on the keen air,
And felt their molten-golden music timing
To the heart's pulses answering unaware.

Sweet, mournful eyes, long closed upon earth's sorrow,

Sleep restfully after life's fevered dream!
Sleep, wayward heart! till on some cool, bright morrow,

Thy soul, refreshed, shall bathe in morning's beam.

Though cloud and sorrow rest upon thy story,
And rude hands lift the drapery of thy pall,
Time, as a birthright, shall restore thy glory,
And Heaven rekindle all the stars that fall.

Cod-Liver Oil.

The quantity of refined cod-liver oil manufactured in Newfoundland is enormous, and is every year increasing. Last year the customs returns gave the quantity of refined cod-liver oil exported at three hundred and thirty-three tons, the value there being twenty-one thousand six hundred and forty-five pounds, or at the rate of sixty-five pounds per ton. In Europe it is retailed at four or five times that price, besides being largely adulterated. The following is the process by which the best oil is produced: The livers are first thoroughly washed, and when quite fresh, before any putrefaction has set in, they are placed in a large tin boiler, to which a moderate degree of heat is applied by putting it in a vessel of hot

water. So soon as the oil is extracted by this gentle degree of heat it is dipped out and filtered, first through thin flannel, and then twice through bags of moleskin. From the last filtration it comes out quite pure, nearly inodorous, and of a crystalline transparency. It is now put in casks holding sixty gallons each, and sent to the exporting-merchant's stores. The process is very simple, but requires great attention to cleanliness in regard to the vessels, bags, etc., used in the manufacture.

It is also very important that just the right degree of heat should be applied—no more, no less—in order to insure a thoroughly good oil. The rancidity and other disagreeable properties of some oil are caused either by allowing the livers to remain too long before being "cooked," or by want of attention to cleanliness. When the oil has been extracted by the process described, it retains its iodine and all other medicinal properties. All pretences about subjecting it to purifying processes, to remove its fishy taste, are merely the "tricks of trade," or of dishonest quacks. These selfish dealers frequently purchase the common cod-liver oil, which has been made cheaply by the putrefying process, and is only fit for machinery or manufacturers, and, having filtered it through animal charcoal, they sell it for the genuine article. Hence a vast amount of worthless cod-liver oil is placed in the market; for, while the charcoal filter deprives it of all bad smell, the putrefying process has already deprived it of its iodine, on which its medicinal virtue is dependent.

A Monkey-Story.

A monkey, which was permitted to run free, had frequently seen the men-servants in the great country-kitchen take down a powder-horn, that stood on the chimney-piece, and throw a few grains into the fire to make the maids scream, which they always did on such occasions. Pug waited his opportunity, and when all was still he clambered up, got possession of the well-filled powder-horn, perched himself gingerly on one of the horizontal wheels placed for the support of saucepans, right over the warm ashes of an almost extinct wood-fire, screwed off the top of the horn, and reversed it over the grate. The explosion sent him half-way up the chimney. Before he was blown up he was a snug, trim, well-conditioned monkey; he came down carbonated. The weight with which he pitched upon the hot ashes in the midst of the general flare-up, aroused him to a sense of his condition. He was missing ten days. Hunger at last drove him forth, and he sneaked into the house, looking scared and devilish; but, like some other great personage, he never got over his sudden elevation and fall. If ever Pug forgot himself and was troublesome, you had only to take down a powder-horn in his presence, and he was off to his life like a shot, screaming and chattering his jaws like a pair of castanets.

An Elephant on a Strike.

It is lucky there are no trades' unions among elephants, for an elephant "on strike" is as destructive as a Sheffield unionist. An elephant employed by the Government of India in hauling teak-logs, for the forest department, in the Anamallay Forest, lately brought about a suspension of operations for above a fortnight. He began by knocking down his keeper, but luckily did not kill him. He then made for the huts of the keepers, whose wives and families were driven into the jungle. He displayed his skill in pulling down the huts, smashed up the carts and implements, and destroyed a quantity of provisions stored up for

his brother-elephants. After keeping the settlement in alarm for some fifteen days, he was shot in one of the legs, and then caught and chained.

Varieties.

ONE of the most stylish of recent bridal-costumes in New York was of white satin, the side-breadths cut rather short, and the back-breadth forming a very long square train. This was without trimming, the front-breadth being trimmed with heavy wide flounces of old lace beaded with beautiful artificial flowers made of mother-of-pearl; a small pointed overskirt was worn, also edged with a full of costly lace; the whole waist was completely covered with drooping folds of the same beautiful material. The veil was of old point-lace, fastened with a wreath of orange-blossoms, and the jewelry pearls.

A prize of ten dollars was recently offered to any member of the Georgia Teachers' Institute who would write and spell correctly the words in the following sentence: "It is an agreeable sight to witness the unparalleled embarrassment of a harnessed pedlar attempting to gauge the symmetry of a peeled onion, which a sibyl has stabbed with a poniard regardless of the innuendoes of the lilies of the cornelian hue." Thirty-eight teachers competed for the prize, but not one was successful.

Last summer a Boston establishment tanned fifty anaconda-skins for boot-leather. The boots are valued at fifty dollars a pair. The largest of these skins was forty feet in length. The tanning processes were similar to those observed in the manufacture of alligator-leather, the product being a very beautiful and highly-finished quality of leather, glossy, mottled, pliable, and, from the appearance of the grain, exceedingly durable.

A resident of Taunton, Massachusetts, has obtained his ice for summer use, for several winters past, in the following manner: Procuring about fifty empty flour-barrels, at a cost of twenty cents each, he gradually pours in water until each contains a solid mass of ice. The barrels are then put away in his cellar and entirely covered with sawdust. As ice is required, a barrel is tapped.

The West Wisconsin Railway, which runs on an air-line from St. Paul to Milwaukee and Chicago, is one hundred and fifty-four miles in length, and owns a million acres of first-rate farming-land granted by Congress, and estimated to be worth ten million dollars, which is more than the whole of its bonded debt. It is no wonder that the bonds of that railroad are in demand!

The following words actually formed the peroration to the counsel's plea for his client in an assault-and-battery case at Athens, Alabama: "Let the humble ass crop the thistle of the valley! Let the sagacious goat browse upon the mountain's brow; but, gentlemen of the jury, I say John Gundlo is not guilty!"

Professor Davidson, of the Coast Survey, says that Mount Rainier, a peak of the Cascade Range, in Washington Territory, is definitely ascertained to have an elevation of fourteen thousand four hundred and forty-four feet. California is now trying to discover a peak within its borders higher than this, and thinks it has it in Mount Whitney.

The mortality in the ranks of the English peerage, during 1870, has been considerably less than in the course of the previous year, when the deaths of thirty-two lords, spiritual and temporal, were recorded. Last year, one bishop and eighteen temporal peers died.

London is well provided for amusements, supporting thirty-eight theatres and twenty-six music-halls, besides the opera, Cremorne Garden, and one or more circuses. Over seventeen hundred performers gain their living from the music-halls alone.

Forty thousand books—some of them very valuable ones—have been sent from the Royal Library at Königsberg to replenish the Stras-

bourg Library. They are mostly works of which the Königsberg Library retains duplicates.

The present style of men's hats is an exact representation of the fashion of 1840. The present scrambled style of ladies' head-dress is of older origin, being, according to a contemporary, the identical fashion which prevailed before the invention of combs.

A gentleman who was shut up in Paris during the late siege says that he ate rat at a restaurant, served up in a *salmis* with gravy and toast, and found it excellent. He says: "I have no objection to repeat the experiment to-morrow. The flesh was white and delicate, like young rabbit, but with more flavor."

A scoffer, who has been contending that he could not learn from the most careful reading of the papers what good the scientific party of Mount Washington is doing, was dumfounded when he learned that they had discovered "a snow-flake of a heretofore undescribed form."

The following speech is attributed to a member of the Legislature of Pennsylvania: "I know wimun, Mr. Speaker; I say it in no disrespect; I know um; I have had a heap to do with um; they're a useful class, and—and yet with the best of 'em you may have trouble."

A Columbus (Ohio) photographer presented a revolver at the head of a gentleman who was sitting for his photograph, with the cheering remark: "My reputation as an artist is at stake. If you don't look smiling, I'll blow your brains out." He smiled.

A Chicago music-store recently sold a piano, and the buyer soon after wrote to the dealers that he and his wife couldn't find the place to wind it up, and they wanted to be told at once how to make the thing go.

Phoebe Riley, wife of the author of "Riley's Narrative," an account of captivity among the Arabs—a book which stood in high favor sixty years or more ago—died in Ohio lately, aged ninety-four years.

It is mentioned in English papers as a coincidence that eleven members of the House of Commons died in 1869, and the same number in 1870. All who died last year belonged to the Liberal party.

The *Engineering Magazine* says: "We are on the brink of a new era in railways—the era of the narrow-gauge railway—an era of renewed activity, when every village, almost farmstead, may have its railway."

"Do you like codfish-balls, Mr. Wiggins?" "I really don't know, miss, I can't recollect ever attending one," replied Mr. W., hesitatingly.

A Massachusetts railway in 1834 gave notice that "passengers are not sent for by the company, but seats are provided for all who apply at the ticket-office."

The English spiritualists claim as fellow-believers Dickens, Thackeray, Browning, Disraeli, Carlyle, Matthew Arnold, and other noted literary men.

"Darling, it's bedtime. All the little chickens have gone to bed." "Yes, mamma, and so has the old hen."

Mrs. Partington is collecting autocrats, and will be grateful for any specimens of the handwriting of extinguished characters.

The combined capital of the Rothschilds' banking-houses in London, Paris, Frankfurt, and Vienna, is five hundred million dollars.

There are five female clerks in the Kansas Legislature.

Grammatical—Is Arabella the plural of Isabella?

A young woman's conundrum—Who is our favorite Roman hero? Marius.

What is that which ties two persons but only touches one? A wedding-ring.

The Queen of Denmark spends annually only one hundred dollars for new dresses.

Henry Ward Beecher says it will never do "to preach cream and practise skim-milk."

The Museum.

THE large tract of land which forms the delta of the Orinoco, in South America, possesses some very remarkable characteristics. It is always wet, but during several months in the year it is completely inundated, the river rising to an astonishing height, and covering with water a tract nearly half as large as England. This seems to be as unpropitious a spot as could be adopted for human habitations, and yet the Waraus (or Guarános, as Humboldt spells the word) have established themselves there, and prefer it to any other locality, probably because their strange mode of life enables them to pass an existence of freedom.

Varying much in the height to which it rises, in some places exceeding fifty feet, the Orinoco has the quality of rising year after year to the same height in the same place, so that when a mark is made to designate the height to which the water rose in one year, the same mark will answer year after year with scarcely the slightest deviation. It is evident that in such a spot, where the soil is in the dry season nothing but mud, and in the wet season is forty or fifty feet under water, only a very peculiar vegetation can live. This is the *Itá* (pronounced Eetáh) palm, belonging to the genus *Mauritia*, a plant which, like the mangrove of Africa, requires plenty of heat and moisture to enable it to develop itself fully. The native name for this tree is *Murichi*. When full grown, it resembles a tall, cylindrical pillar, with a fan of ten or twelve vast leaves spreading from its extreme top. Each leaf is some ten feet in width, and is supported upon a huge stem about twelve feet in length, looking more like a branch than a leaf-stem. Indeed, a complete leaf is a heavy load for a man. At regular intervals the whole fan of leaves falls off, and is replaced by another, the tree adding to its height at every change of leaf, until the stem is nearly a hundred feet high, and fifteen in circumference. Myriads upon myriads of these marvellous trees rise amid the waters of the Orinoco delta, sometimes clustered into solid masses of vegetation, sometimes scattered, and sometimes drawn up in devious avenues, according to the windings of the muddy channels that even in the dry seasons traverse the country. Whether grouped or scattered, the *itá* flourishes in this delta to such an extent that only the experienced canoe-men of the place can navigate their barks among the tall stems, the narrow and winding channels which form the natural paths being completely obliterated by the waste of water. Any stranger who tried to thread this aquatic forest without the aid of a native guide would soon lose himself among the armies of *itá*-palm, and perish miserably of hunger. Yet this very tree supplies to the Waraus of the Orinoco not only all the necessities, but the luxuries of life, and were the whole tribe to be cut off from the main-land, they could support themselves without the least difficulty, the *itá*-palm supplying house, food, drink, clothing, and furniture.

The Warau requires for a house nothing but a floor and a roof, which he proceeds to construct in the following manner: Selecting four *itá*-trees that grow near each other in the form of a square, and cutting away any of the intervening trees, he makes use of these four as the corner-posts of his house. He knows by marks left on the trunks the precise height to which the water will rise, and some three feet or so above this mark he builds his floor, cutting deep notches in the trunk. In these notches are laid beams made from the stems of the felled *itá*-palms, and lashed tightly in their places by ropes made of *itá*-fibre. On these beams

are laid a number of cross-pieces, some times made from the split trunks, but usually being nothing more than the gigantic leaf-stems which have been already mentioned, and which are when dry very light, very tough, and very elastic. These cross-pieces are tied firmly together, and constitute the essential part of the floor. On them is placed a layer of palm-leaves, and upon the leaves is a thick coating of mud, which soon dries under the tropical sun, and forms a smooth, hard, and firm flooring, which will bear a fire without risk of damage to the wooden structure below. Ten or twelve feet above the floor the Warau constructs a roof of palm-leaves, the corners of which are supported by the same trees which uphold the house, and then the chief labors of the native architect are over.

So much for the house furnished by the itá-palm. Food is supplied by it in various forms. First, there is the fruit, which, when ripe, is as large as an ordinary apple, many hundreds of which are developed on the single branch produced by this tree. Next, there are the trunk of the tree and its contents. If it be split longitudinally at the time when the flower-branch is just about to burst from the enveloping spathe,

a large quantity of soft, pith-like substance is found within it. This is treated like the cassava, and furnishes a sort of bread called yuruma.

Drink is also obtained from the itá-palm. From the trunk is drawn a sap, which, like that of the maguey or great American aloe, can be fermented, and then it becomes intoxicating in quality. Another kind of drink is procured from the fruit of the itá, which is bruised, thrown into water, and allowed to ferment for a while. When fermentation has proceeded to a sufficient extent, the liquor is strained through a sieve made of itá-fibre, and is thus ready for consumption.

The small amount of clothing required by

the Warau is also obtained from the itá, the membrane of the young leaf being stripped off and woven into a simple fabric. From the same tree the Warau obtains all his furniture. Bows, arrows, and spears, are made from its leaf-stems, the canoe in which he goes fishing is made from a hollow itá-trunk, and the lines and nets are both furnished from the same tree, as is also the string of which his hammock is made. That the one single tree should be able to supply all the wants of an entire population is the more extraordinary, because in former days the Warau had no iron tools, and it is not easy to find a tree that will at the same time furnish all the necessities of his life, and be of such a character that it can be worked by the rude stone

implements which the Warau had to use before he obtained iron from the white men. It may readily be imagined that the Warau who inhabit this strange region are lower in the scale of civilization than those who live on dry land, and, to use the words of Humboldt, "in the lowest grades of man's development we find the existence of an entire race dependent upon almost a single tree, like certain insects which are confined to particular portions of a flower."

Lake-dwellings on the Orinoco.

LIFE INSURANCE.

No more significant index to the vast strides which the nation has made in commercial prosperity and in the practice of economics can be found than in the enormous development of life assurance as a principle, and the rapid growth of the companies which first put it in operation. The assets of the largest English companies are small in comparison with several of our own which were scarcely in existence a quarter of a century ago. The oldest of our companies, we believe, scarcely dates back to 1840. Yet now the leading American societies rank among the greatest in the world; the insured are counted by hundreds of thousands, and more capital is employed in these institutions than in any other commercial interest, except banking and the working of the vast system of railways that reticulates the surface of the country. When one reflects that Life Insurance is, without doubt, the most benevolent in its results of any purely mercantile principle ever devised by man; that it means the prevention of pauperism, the lessening of the vast sum of the ills that spring from poverty, and the stimulation of a desire which becomes a powerful moral agent when reduced to practice; the contemplation of this prodigious growth must afford great satisfaction. Of course, much of the good to be derived from Life Assurance Societies depends upon the safety of their management, and though there are periodical alarms both here and in England, and occasional betrayals of trust by speculative corporations, we believe that our best companies are managed with sound and judicious ability. About ten years ago "The Ten Year Non-forfeitable Policy" was introduced by the New York Life Insurance Company, and has since proved so popular that it has been adopted by all the leading American companies. The same company was the first to abandon the clause rendering forfeit the policies of suicides, and is still the only one in whose policies that specification is omitted. The New York Life was organized in 1845, and has become one of the most popular of the New York companies. Some of the ablest and most solid of our business men are identified with it, and its management is in a marked degree judicious and conservative, and at the same time vigorous. Few other companies have met with an equal measure of popular favor, and we believe in the perfect security of the vast interests entrusted to the control of the present managers. The Company is a purely mutual one, and returns annually to the policy-holders the whole profits of the business.

RALPH THE HEIR.

By ANTHONY TROLLOPE.

[“RALPH THE HEIR,” SUPPLEMENT NO. XVIII.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF MARCH 4.]

CHAPTER XLVII.

THE WAY WHICH SHOWS THAT THEY MEAN IT.

IF this kind of thing were to go on, life wouldn't be worth having. That was the feeling of Ralph, the squire of Newton, as he returned on that Saturday from London to the Moonbeam; and so far Mr. Neeft had been successful in carrying out his threat. Neeft had sworn that he would make the young man's life a burden to him, and the burden was already becoming unbearable. Mr. Carey had promised to do something. He would, at any rate, see the infatuated breeches-maker of Conduit Street. In the mean time he had suggested one remedy of which Ralph had thought before.

“If you were married to some one else, he'd give it up,” Mr. Carey had suggested.

That, no doubt, was true.

Ralph completed his sojourn at the Moonbeam, leaving that place at the end of the first week in April, took a run down to his own place, and then settled himself up to London for the season. His brother Gregory had at this time returned to the parsonage at Newton; but there was an understanding that he was to come up to London and be his brother's guest for the first fortnight in May. Ralph the heir had taken larger rooms, and had a spare chamber. When Ralph had given this invitation, he had expressed his determination of devoting his spring in town to an assiduous courtship of Mary Bonner. At the moment in which he made that assertion down at Newton, the nuisance of the Neeft affair was less intolerable to him than it had since become. He had spoken cheerily of his future prospects, declaring himself to be violently in love with Mary, though he declared at the same time that he had no idea of breaking his heart for any young woman. That last assertion was probably true.

As for living in the great house at the Priory all alone, that he had declared to be impossible. Of course, he would be at home for the hunting next winter; but he doubted whether he should be there much before that time, unless a certain coming event should make it necessary for him to go down and look after things. He thought it probable that he should take a run abroad in July; perhaps go to Norway for the fishing, in June. He was already making arrangements with two other men for a move in August. He might be at home for partridge-shooting about

the middle of September, but he shouldn't “go into residence” at Newton before that. Thus he had spoken of it in describing his plans to his brother, putting great stress on his intention to devote the spring months to the lovely Mary. Gregory had seen nothing wrong in all this. Ralph was now a rich man, and was entitled to amuse himself. Gregory would have wished that his brother would at once make himself happy among his own tenants and dependants, but that, no doubt, would come soon. Ralph did spend two nights at Newton after the scene with Neeft in the Moonbeam-yard—just that he might see his nags safe in their new quarters—and then went up to London. He was hardly yet strong in heart, because such a trouble as that which vexed him in regard to Polly, does almost make a man's life a burden. Ralph was gifted with much aptitude for throwing his troubles behind, but he hardly was yet able to rid himself of this special trouble. That horrid tradesman was telling his story to everybody. Sir Thomas Underwood knew the story; and so, he thought, did Mary Bonner. Mary Bonner, in truth, did not know it; but she had thrown in Ralph's teeth, as an accusation against him, that he owed himself and his affections to another girl; and Ralph, utterly forgetful of Clarissa and that now long-distant scene on the lawn, had believed, and still did believe, that Mary had referred to Polly Neeft. On the 10th of April he established himself at his new rooms in Spring Gardens, and was careful in seeing that there was a comfortable little bedroom for his brother Greg. His uncle had now been dead just six months, but he felt as though he had been the owner of the Newton estate for years. If Mr. Carey could only settle for him that trouble with Mr. Neeft, how happy his life would be to him! He was very much in love with Mary Bonner, but his trouble with Mr. Neeft was of almost more importance to him than his love for Mary Bonner.

In the mean time the girls were living, as usual, at Popham Villa, and Sir Thomas was living, as usual, in Southampton Buildings. He and his colleague had been unseated, but it had already been decided by the House of Commons that no new writ should be at once issued, and that there should be a commission appointed to make extended inquiry at Percycross in reference to the contemplated disfranchisement of the borough. There could be no possible connection between this inquiry

and the expediency of Sir Thomas living at home; but, after some fashion, he reconciled further delay to his conscience by the fact that the Percycross election was not even yet quite settled. No doubt, it would be necessary that he should again go to Percycross during the sitting of the commission.

The reader will remember the interview between Gregory Newton and Clarissa, in which poor Clary had declared with so much emphasis her certainty that his brother's suit to Mary must be fruitless. This she had said, with artless energy, in no degree on her own behalf. She was hopeless now in that direction, and had at last taught herself to feel that the man was unworthy. The lesson had reached her, though she herself was ignorant not only of the manner of the teaching, but of the very fact that she had been taught. She had pleaded, more than once, that men did such things, and were yet held in favor and forgiven, let their iniquities have been what they might. She had hoped to move others by the doctrine; but gradually it had ceased to be operative, even on herself. She could not tell how it was that her passion faded and died away. It can hardly be said that it died away; but it became to herself grievous and a cause of soreness, instead of a joy and a triumph. She no longer said, even to herself, that he was to be excused. He had come there, and had made a mere plaything of her—willfully. There was no earnestness in him, no manliness, and hardly common honesty. A conviction that it was so had crept into her poor, wounded heart, in spite of those repeated assertions which she had made to Patience as to the persistency of her own affection. First dismay and then wrath had come upon her when the man, who ought to be her lover, came to the very house in which she was living, and there offered his hand to another girl, almost in her very presence. Had the sin been committed elsewhere, and with any rival other than her own cousin, she might have still clung to that doctrine of forgiveness, because the sinner was a man, and because it is the way of the world to forgive men. But the insult had been too close for pardon; and now her wrath was slowly changing itself to contempt. Had Mary accepted the man's offer, this phase of feeling would not have occurred. Clarissa would have hated the woman, but still might have loved the man. But Mary had treated him as a creature absolutely beneath her notice, had evidently despised him, and Mary's

scorn communicated itself to *Clarissa*. The fact that *Ralph* was now *Newton of Newton*, absolutely in harbor after so many dangers of shipwreck, assisted her in this. "I would have been true to him, though he hadn't had a penny," she said to herself; "I would never have given him up though all the world had been against him." Debts, difficulties, an inheritance squandered, idle habits, even profligacy, should not have torn him from her heart, had he possessed the one virtue of meaning what he said when he told her that he loved her. She remembered the noble triumph she had felt when she declared to *Mary* that that other *Ralph*, who was to have been *Mary's* lover, was welcome to the fine property. Her sole ambition had been to be loved by this man; but the man had been incapable of loving her. She herself was pretty, and soft, bright on occasions, and graceful. She knew so much of herself; and she knew, also, that *Mary* was far prettier than herself, and more clever. This young man, to whom she had devoted herself, possessed no power of love for an individual—no capability of so joining himself to another human being as to feel that, in spite of any superiority visible to the outside world, that one should be esteemed by him superior to all others—because of his love. The young man had liked prettiness and softness and grace and feminine nicenesses; and seeing one who was prettier and more graceful—all which poor *Clary* allowed, though she was not so sure about the softness and niceness—had changed his aim without an effort! Ah, how different was poor *Gregory*!

She thought much of *Gregory*, reminding herself that, as was her sorrow in regard to her own crushed hopes, so were his. His hopes, too, had been crushed, because she had been so obdurate to him. But she had never been false. She had never whispered a word of love to *Gregory*. It might be that his heart was as sore, but he had not been injured as she had been injured. She despised the owner of *Newton Priory*. She would scorn him should he come again to her and throw himself at her feet. But *Gregory* could not despise her. She had, indeed, preferred the bad to the good. There had been lack of judgment. But there had been on her side no lack of truth. Yes—she had been wrong in her choice. Her judgment had been bad. And yet how glorious he had looked as he lay upon the lawn, hot from his rowing, all unbraced, brown and bold and joyous as a young god, as he bade her go and fetch him drink to slake his thirst! How proud, then, she had been to be ordered by him, as though their mutual intimacies and confidences and loves were sufficient, when they too were alone together, to justify a reversal of those social rules by which the man is ordered to wait upon the woman! There is nothing in the first flush of acknowledged love that is sweeter to the woman than this. All the men around her are her servants; but in regard to this man she may have the inexpressibly greater pleasure of serving him herself. *Clarissa* had now thought much of

these things, and had endeavored to define to herself what had been those gifts belonging to *Ralph* which had won from her her heart. He was not, in truth, handsomer than his brother *Gregory*, was certainly less clever, was selfish in small things from habit, whereas *Gregory* had no thought for his own comfort. It had all come from this—that a black coat and a grave manner of life and serious pursuits had been less alluring to her idleness and pleasure. It had suited her that her young god should be joyous, unbraced, brown, bold, and thirsty. She did not know *Pope's* famous line, but it all lay in that. She was innocent, pure, unknowing in the ways of vice, simple in her tastes, conscientious in her duties, and yet she was a rake at heart—till at last sorrow and disappointment taught her that it is not enough that a man should lie loose upon the grass with graceful negligence and call for soda-water with a pleasant voice. *Gregory* wore black clothes, was sombre, and was a parson—but, oh, what a thing it is that a man should be true at heart!

She said nothing of her changing feelings to *Mary*, or even to *Patience*. The household at this time was not very gay or joyous. *Sir Thomas*, after infinite vexation, had lost the seat of which they had all been proud. *Mary Bonner's* condition was not felt to be deplorable, as was that of poor *Clary*, and she certainly did not carry herself as a lovelorn maiden. Of *Mary Bonner* it may be said that no disappointment of that kind would affect her outward manner; nor would she in any strait of love be willing to make a confidence or to discuss her feelings. Whatever care of that kind might be present to her would be lightened, if not made altogether as nothing, by her conviction that such loads should be carried in silence, and without any visible sign to the world that the muscles are overtaxed. But it was known that the banished *Ralph* had, in the moment of his expected prosperity, declared his purpose of giving all that he had to give to this beauty, and it was believed that she would have accepted the gift. It had, therefore, come to pass that the name of neither *Ralph* could be mentioned at the cottage, and that life among these maidens was sober, sedate, and melancholy. At last there came a note from *Sir Thomas* to *Patience*. "I shall be home to dinner to-morrow. I found the enclosed from *R. N.* this morning. I suppose he must come. Affectionately, *T. U.*" The enclosed note was as follows: "Dear *Sir Thomas*, I called this morning, but old *Stemm* was as hard as granite. If you do not object I will run down to the villa to-morrow. If you are at home I will stay and dine. Yours ever, *Ralph Newton.*"

The mind of *Sir Thomas* when he received this had been affected exactly as his words described. He had supposed that *Ralph* must come. He had learned to hold his late ward in low esteem. The man was now beyond all likelihood of want, and sailing with propitious winds; but *Sir Thomas*, had he been able to consult his own inclinations,

would have had no more to do with him. And yet the young squire had not done any thing which, as *Sir Thomas* thought, would justify him in closing his doors against one to whom he had been bound in a manner peculiarly intimate. However, if his niece should choose at last to accept *Ralph*, the match would be very brilliant; and the uncle thought that it was not his duty to interfere between her and so great an advantage. *Sir Thomas*, in truth, did not as yet understand *Mary Bonner*—knew very little of her character; but he did know that it was incumbent on him to give her some opportunity of taking her beauty to market. He wrote a line to *Ralph*, saying that he himself would dine at home on the day indicated.

"Impossible!" said *Clary*, when she was first told.

"You may be sure he's coming," said *Patience*.

"Then I shall go and spend the day with *Mrs. Brownlow*. I cannot stand it."

"My dear, he'll know why you are away."

"Let him know," said *Clarissa*. And she did as she said she would. When *Sir Thomas* came home at about four o'clock on the Thursday which *Ralph* had fixed—Thursday, the 14th of April—he found that *Clarissa* had flown. The fly was to be sent for her at ten, and it was calculated that, by the time she returned, *Ralph* would certainly have taken his leave. *Sir Thomas* expressed neither anger nor satisfaction at this arrangement.—"Oh; she has gone to *Mrs. Brownlow's*, has she? Very well. I don't suppose it will make much difference to *Ralph*."

"None in the least," said *Patience*, severely. "Nothing of that kind will make any difference to him." But at that time *Ralph* had been above an hour in the house.

We will now return to *Ralph* and his adventures. He had come up to London with the express object of pressing his suit upon *Mary Bonner*; but during his first day or two in London had busied himself rather with the affairs of his other love. He had been with *Mr. Carey*, and *Mr. Carey* had been with *Mr. Neeft*. "He is the maddest old man that I ever saw," said *Mr. Carey*. "When I suggested to him that you were willing to make any reasonable arrangement—meaning a thousand pounds, or something of that kind—I couldn't get him to understand me at all."

"I don't think he wants money," said *Ralph*.

"Let him come down and eat a bit of dinner at the cottage," said he, "and we'll make it all square." Then I offered him a thousand pounds down."

"What did he say?"

"Called to a fellow he had there with a knife in his hand, cutting leather, to turn me out of the shop. And the man would have done it, too, if I hadn't gone."

This was not promising, but on the following morning *Ralph* received a letter which put him into better heart. The letter was from *Polly* herself, and was written as follows:

"ALEXANDRA COTTAGE, HENDON,
"April 10, 186—.

"MY DEAR SIR:

"Father has been going on with all that nonsense of his, and I think it most straightforward to write a letter to you at once, so that things may be understood and finished. Father has no right to be angry with you, any way not about me. He says somebody has come and offered him money. I wish they hadn't, but perhaps you didn't send them. There's no good in father talking about you and me. Of course it was a great honor, and all that, but I'm not at all sure that anybody should try to get above themselves, not in the way of marrying. And the heart is every thing. So I've told father. If ever I bestow mine, I think it will be to somebody in a way of business—just like father. So I thought I would just write to say that there couldn't be any thing between you and me, were it ever so; only that I was very much honored by your coming down to Margate. I write this to you, because a very particular friend advises me, and I don't mind telling you at once—it is Mr. Moggs. And I shall show it to father. That is, I have written it twice, and shall keep the other. It's a pity father should go on so, but he means it for the best. And as to any thing in the way of money—oh, Mr. Newton, he's a deal too proud for that.

"Yours truly,

"MARYANNE NEEFIT."

As to which letter the little baggage was not altogether true in one respect. She did not keep a copy of the whole letter, but left out of that which she showed to her father the very material passage in which she referred to the advice of her particular friend, Mr. Moggs. Ralph, when he received this letter, felt really grateful to Polly, and wrote to her a pretty note, in which he acknowledged her kindness, and expressed his hope that she might always be as happy as she deserved to be. Then it was that he made up his mind to go down at once to Popham Villa, thinking that the Neefit nuisance was sufficiently abated to enable him to devote his time to a more pleasurable pursuit.

He reached the villa between three and four, and learned from the gardener's wife at the lodge that Sir Thomas had not as yet returned. He did not learn that Clarissa was away, and was not aware of that fact till they all sat down to dinner at seven o'clock. Much had been done and much endured before that time came. He sauntered slowly up the road, and looked about the grounds, hoping to find the young ladies there, as he had so often done during his summer visits; but there was no one to be seen, and he was obliged to knock at the door. He was shown into the drawing-room, and in a few minutes Patience came to him. There had been no arrangement between her and Mary as to the manner in which he should be received. Mary on a previous occasion had given him an answer, and really did believe that that would be sufficient. He was, according to her thinking, a light, inconstant man, who

would hardly give himself the labor necessary for perseverance in any suit. Patience at once began to ask him after his brother and the doings at the Priory. He had been so intimate at the house, and so dear to them all, that, in spite of the disapprobation with which he was now regarded by them, it was impossible that there should not be some outer kindness. "Ah," said he, "I do so look forward to the time when you will all be down there. I have been so often welcome at your house, that it will be my greatest pleasure to make you welcome there."

"We go so little from home," said Patience.

"But I am sure you will come to me. I know you would like to see Greg's parsonage and Greg's church."

"I should indeed."

"It is the prettiest church, I think, in England, and the park is very nice. The whole house wants a deal of doing to, but I shall set about it some day. I don't know a pleasanter neighborhood anywhere." It would have been so natural that Patience should tell him that he wanted a mistress for such a home; but she could not say the words. She could not find the proper words, and soon left him, muttering something as to directions for her father's room.

He had been alone for twenty minutes when Mary came into the room. She knew that Patience was not there, and had retreated up-stairs. But there seemed to be a cowardice in such retreating, which displeased herself. She, at any rate, had no cause to be afraid of Mr. Newton. So she collected her thoughts, and arranged her gait, and went down, and addressed him with assumed indifference—as though there had never been any thing between them beyond simple acquaintance. "Uncle Thomas will be here soon, I suppose," she said.

"I hope he will give me half an hour first," Ralph answered. There was an ease and grace always present in his intercourse with women, and a power of saying that which he desired to say—which perhaps arose from the slightness of his purposes, and the want of reality in his character.

"We see so little of him that we hardly know his hours," said Mary. "Uncle Thomas is a sad truant from home."

"He always was, and I declare I think that Patience and Clary have been the better for it. They have learned things of which they would have known nothing had he been with them every morning and evening. I don't know any girls who are so sweet as they are. You know they have been like sisters to me."

"So I have been told."

"And when you came, it would have been like another sister coming; only—"

"Only what?" said Mary, assuming purposely a savage look.

"That something else intervened."

"Of course it must be very different—and it should be different. You have only known me a few months."

"I have known you enough to wish to

know you more closely than anybody else for the rest of my life."

"Mr. Newton, I thought you had understood me before."

"So I did." This he said with an assumed tone of lachrymose complaint. "I did understand you—thoroughly. I understood that I was rebuked, and rejected, and disdained. But a man, if he is in earnest, does not give over on that account. Indeed, there are things which he can't give over. You may tell a man that he shouldn't drink, or shouldn't gamble; but telling will do no good. When he has once begun, he'll go on with it."

"What does that mean?"

"That love is as strong a passion, at any rate, as drinking or gambling. You did tell me, and sent me away, and rebuked me, because of that tradesman's daughter."

"What tradesman's daughter?" asked Mary. "I have spoken of no tradesman's daughter. I gave you ample reason why you should not address yourself to me."

"Of course there are ample reasons," said Ralph, looking into his hat, which he had taken from the table. "The one—most ample of all, is that you do not care for me."

"I do not," said Mary, resolutely.

"Exactly—but that is a sort of reason which a man will do his best to conquer. Do not misunderstand me. I am not such a fool as to think that I can prevail in a day. I am not vain enough to think that I can prevail at all. But I can persist."

"It will not be of the slightest use; indeed, it cannot be allowed. I will not allow it. My uncle will not allow it."

"When you told me that I was untrue to another person—; I think that was your phrase."

"Very likely."

"I supposed you had heard that stupid story which had got round to my uncle—about a Mr. Neefit's daughter."

"I had heard no stupid story."

"What, then, did you mean?"

Mary paused a moment, thinking whether it might still be possible that a good turn might be done for her cousin. That Clarissa had loved this man with her whole heart she had herself owned to Mary. That the man had professed his love for Clary, Clary had also let her know. And Clary's love had endured even after the blow it had received from Ralph's offer to her cousin. All this that cousin knew; but she did not know how that love had now turned to simple soreness. "I have heard nothing of the man's daughter," said Mary.

"Well, then?"

"But I do know that before I came here at all you had striven to gain the affections of my cousin."

"Clarissa!"

"Yes; Clarissa. Is it not so?" Then she paused, and Ralph remembered the scene on the lawn. In very truth it had never been forgotten. There had always been present with him, when he thought of Mary Bonner, a sort of remembrance of the hour in which he had played the fool with dear Clary. He

had kissed her. Well; yes; and with some girls kisses mean so much—as Polly Neeft had said to her true lover. But then with others they mean just nothing. “If you want to find a wife in this house, you had better ask her. It is certainly useless that you should ask me.”

“Do you mean quite useless?” asked Ralph, beginning to be somewhat abashed.

“Absolutely useless. Did I not tell you something else—something that I would not have hinted to you, had it not been that I desired to prevent the possibility of a renewal of any thing so vain? But you think nothing of that! All that can be changed with you at a moment, if other things suit.”

“That is meant to be severe, Miss Bonner, and I have not deserved it from you. What has brought me to you but that I admire you above all others?”

“You shouldn’t admire me above others. Is a man to change as he likes because he sees a girl whose hair pleases him for the moment better than does hers to whom he has sworn to be true?” Ralph did not forget at this moment to whisper to himself, for his own consolation, that he had never sworn to be true to Clarissa. And, indeed, he did feel that, though there had been a kiss, the scene on the lawn was being used unfairly to his prejudice. “I am afraid you are very fickle, Mr. Newton, and that your love is not worth much.”

“I hope we may both live till you learn that you have wronged me.”

“I hope so. If my opinion be worth any thing with you, go back to her from whom you have allowed yourself to stray in your folly. To me you must not address yourself again. If you do, it will be an insult.” Then she rose up, queenly in her beauty, and slowly left the room.

There must be an end of that. Such was Ralph’s feeling as she left the room, in spite of those protestations of constancy and persistence which he had made to himself. “A fellow has to go on with it, and he refused half a dozen times by one of those proud ones,” he had said; “but when they do knuckle under, they go in harness better than the others.” It was thus that he had thought of Mary Bonner, but he did not so think of her now. No indeed. There was an end of that. “There is a sort of way of doing it, which shows that they mean it.” Such was his inward speech; and he did believe that Miss Bonner meant it. “By Jove, yes; if words and looks ever can mean any thing.” But how about Clarissa? If it was so, as Mary Bonner had told him, would it be the proper kind of thing for him to go back to Clarissa? His heart, too—for he had a heart—was very soft. He had always been fond of Clarissa, and would not, for worlds, that she should be unhappy. How pretty she was, and how soft, and how loving! And how proudly happy she would be to be driven about the Newton grounds by him as their mistress! Then he remembered what Gregory had said to him, and how he had encouraged Gregory to persevere. If any thing of that kind were to happen, Gregory must put up with it. It was clear that Clarissa couldn’t marry Gregory if she were in love with him. But how would he look Sir Thomas in the face? As he thought of this he laughed. Sir Thomas, however, would be glad enough to give his daughter, not to the heir, but to the owner of Newton. Who could be that fellow whom Mary Bonner preferred to him—with all Newton to back his suit? Perhaps Mary Bonner did not know the meaning of being the mistress of Newton Priory.

After a while the servant came to show

him to his chamber. Sir Thomas had come and had gone at once to his room. So he went up-stairs and dressed, expecting to see Clarissa when they all assembled before dinner. When he went down, Sir Thomas was there, and Mary, and Patience—but not Clarissa. He had summoned back his courage, and spoke jauntily to Sir Thomas. Then he turned to Patience and asked after her sister. “Clarissa is spending the day with Mrs. Brownlow,” said Patience, “and will not be home till quite late.”

“Oh, how unfortunate!” exclaimed Ralph. Taking all his difficulties into consideration, we must admit that he did not do it badly.

After dinner Sir Thomas sat longer over his wine than is at present usual, believing, perhaps, that the young ladies would not want to see much more of Ralph on the present occasion. The conversation was almost entirely devoted to the affairs of the late election, as to which Ralph was much interested and very indignant. “They cannot do you any harm, sir, by the investigation,” he said.

“No; I don’t think they can hurt me.”

“And you will have the satisfaction of knowing that you have been the means of exposing corruption, and of helping to turn such a man as Griffenbottom out of the House. Upon my word, I think it has been worth while.”

“I am not sure that I would do it again, at the same cost, and with the same object,” said Sir Thomas.

Ralph did have a cup of tea given to him in the drawing-room, and then left the villa before Clarissa’s fly had returned.

APPLETONS' JOURNAL

OF LITERATURE · SCIENCE · AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 104.—VOL. V.]

SATURDAY, MARCH 25, 1871.

[PRICE TEN CENTS.]

“BY THE WINTER SEA.”

THE long gray reach of the wind-swept beach ;
The morning sunlight's quivering gold ;
The swooping sea-bird's piercing screech,
And skies all dull and cold.

No sail o'er ocean's leaden waste ;
The waves' unceasing monotone ;

A stranded wreck with ice encased,
Dreary and stark and lone.

And there are hearts that watch and wait
For those who toil upon the shore :
Their welcome footstep at the gate
Is heard—ah, nevermore !

And hardy cheeks, unblanched by fear,
Grow sad when gentle thoughts of home
Awake the soft and glistening tear
That will unbidden come.

Stout hearts! a lesson brave ye teach
Beside your scanty, cheerless fire,
While thundering waves upon the beach
Sweep down in wintry ire.

Oh, still upon the icy gale
That voice of grief is borne to me,
And whispers in my ear a tale
Of wrecks far out at sea!

GEORGE COOPER.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER III.—PAULINE MORTON.

IF Mr. Warwick had announced the entire destruction of Tallahoma and all its inhabitants by an earthquake, there scarcely could have ensued a more astonished pause than followed the utterance of that name. For the full space of a minute, an entire silence reigned around the table—a silence which Mrs. Marks was, of course, the first to break.

"You have seen Pauline Morton, John?"

"Yes," answered he, laconically.

"Is she in town?"

"She was in town, or else I could not have seen her."

"But, bless my soul!" cried Mr. Marks, "where did she come from, Warwick?—when did you see her?"

"Of course she came from Europe. I saw her as she passed through Tallahoma, this afternoon, late."

"Well, tell us all about it," cried his sister, a little impatient at these brief replies. "What is the use of doling out news like this? Tell us how she looked, and what she said, and where she is going, and what she means by coming back here?"

"Did you happen to see a travelling-carriage pass here about dusk, laden with trunks, dogs, and monkeys?"

At this question there rose a shout from the children—the eager little pitchers, whose eyes and ears were open to all that was going on.

"We did! Uncle John, we did! And a pretty lady, and a little boy in it, too."

"Yes," said Uncle John, quietly. "That was Pauline Morton, on her way to Morton House."

"To Morton House?" repeated Mr. Marks. "Then Shields, at least, must have known that she was coming."

Again Mr. Warwick shook his head. "No. Shields was in my office this morning about that business of a trespass on the land; and I will answer for it that he had as little idea of seeing the owner of the land as you or I might have had. Besides, she told me that she had not announced her coming to any one."

"And yet you say she went to Morton House?"

"Straight to Morton House.—Heaven help poor Shields's brain this night!"

"Surely you must have mistaken," urged Mr. Marks. "Surely she went to Annesdale—her own first cousin's, you know."

Mr. Warwick shrugged his shoulders. "I should think you would remember how little love there was between her and her first cousin, of old."

"I remember," cried Mrs. Marks, "and I am sure that Pauline Morton would never go uninvited to Mrs. Annesley's house. But oh, John, she could not have gone to Morton House to stay to-night!—why, think of those beds that nobody has slept in for twenty years!"

"Twenty years or not, she meant to do it; and I don't think there's a doubt but that she has done it. Twenty years! Can it be really twenty years since she went away, Bessie?"

"Twenty years this past summer," said Mrs. Marks, decidedly. "I remember the very day. Did her brother come back, John?—and surely her husband is with her?"

"Her brother, she tells me, is dead. She did not mention her husband; but I judge that she is a widow."

"And she came alone?"

"With the exception of a child and a servant, quite alone."

"Her brother dead!" repeated Mr. Marks, whose somewhat slow ears this last item had just reached. "There must be some mistake about that, John—you must have misunderstood her, or his death has happened very lately. It is not more than a few weeks since Shields showed me a letter he had just received from him."

"I only know that she is in deep mourning," Mr. Warwick answered; "and that, when I glanced at her dress, she said—or, if she didn't say, she intimated—that it was for her brother she was wearing it."

"It is very strange," said Mr. Marks, reflectively. "He must have dropped off like his Uncle Paul; for all the rest of the Mortons that ever I heard of were very long-lived people. She did not mention his complaint, did she?"

"No. She said very little—in fact, I saw her for a few minutes only."

"But her looks, John!" cried Mrs. Marks, with a woman's curiosity on this important subject. "Is she as handsome as ever?"

"How do most women look, Bessie, when a gap of twenty years separates them from youth?"

"Why, rather the worse for wear," answered Mrs. Marks, with a glance toward her own face, as reflected in the burnished coffee-pot. "But I cannot imagine Pauline Morton any less beautiful than when I saw her last."

"You had better not see her again, then."

"Has she changed so dreadfully?"

"She is the wreck—the ghost, as I told the children—of her former self."

"Dear, dear! to think of it! But she *has* been married, has she not?"

"Certainly. I told you she had a child with her."

"And whom did she marry? You know there were all sorts of reports at the time—people said she had married a count, or some such person."

"Which was as true as reports generally are. Pauline Morton has come back as Mrs. Gordon."

"Mrs. *what*?"

"Gordon. Did you ever hear the name before—in connection with her, I mean?"

"Never!" cried Mrs. Marks, with a decision which rather surprised the governess, sitting by in profound ignorance of the subject under discussion. "I heard that she had married some nobleman, and that she lived in Europe in grand style; and—and—for her to come back like this, to a place she always hated! Oh, John, I don't believe it!"

"That's just as you please," Mr. Warwick answered, rising and walking to the fire. "I assure you, I have the name on her own authority; and, as for those ridiculous stories of counts and the like, of course no sensible person ever credited them. I remember hearing that she had married an officer in the English army; and, no doubt, this is, or was, the man.—Miss Tresham, did you see the carriage this afternoon?"

"Yes; and the lady also," Katharine answered. "I had only a glimpse of her face, but it struck me very much. Does she belong to the Morton House where the children and I go to walk almost every evening?"

"Morton House belongs to her," Mr. Marks answered, dryly. "I am afraid, if she has come back for good, your walks are at an end, Miss Kate."

"Oh!" cried the children, in chorus. "Can't we go to Morton House any more, and make Ponto chase rabbits in the garden? Oh, papa, why not?"

"Don't you hear why not?" asked Mrs. Marks, a little sharply—"don't you hear that the person who owns Morton House has come back to live in it? Now hush—or I will call Letty and send you straight to bed!—John, dear, you haven't told us yet where you met—Mrs. Gordon."

"Haven't I?" said Mr. Warwick, a little wearily—he was evidently

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

tired of the subject that was still so absorbing to his sister. "Well, it is not much to tell, Bessie. I left my office at dusk, this evening, and was on my way to the post-office to get the mail, when the carriage of which I spoke came down the street. I glanced at it a little curiously, wondering where it was going at that time of day, when a face, that I should have recognized among a thousand, looked out, and made a sign to the driver to stop. Before I knew what I was about, I was shaking hands with Pauline Morton."

He paused, with a half smile at the expression of eager interest on his sister's face; but, notwithstanding the smile, more than one of his hearers noticed that it cost him an effort to resume.

"The first thing I remember was her saying, 'How changed you are!' And I looked at her, and answered, 'I am sure I cannot be more changed than you are.'"

"Why, John!" cried Mrs. Marks, reproachfully.

"You think that was rather plain speaking? I thought so myself when it was too late to recall the words. But she did not seem offended by my candor. She only smiled a little, and said, 'Yes, I am very much changed—you will believe that when I tell you that I have come back to Morton to live.' I don't know what I said—something about my surprise, probably; for I was surprised, as you may well imagine—but she repeated the statement, and then, noticing that I looked at her black dress, she added: 'My poor brother!—you see I am all alone in the world.' 'Excepting,' said I, glancing at the child opposite. 'Yes,' she answered, quietly, 'excepting him.' Then she told him to shake hands with one of his mother's old friends; and the boy, who is a splendid-looking little fellow, held out his hand at once, and spoke to me—no hanging of the head, and putting the finger in the mouth, Dick. After a few more words, his mother said they must go on, as she wished to reach Morton House before night. So she held out her hand, saying she would be glad to see me; and you will be shocked to hear, Bessie, that, in responding to the invitation, I called her Miss Morton."

"Good gracious!"

"It was very thoughtless, and, of course, I began a hasty apology, being more annoyed at my awkward mistake from perceiving the effect which it produced upon her. First she flushed, and then she turned so pale that for a minute I thought she was going to faint. But she only gasped for breath a little, and cut short my apology by saying: 'There is nothing to excuse. I am very foolish; but it has been a long time since I heard that name, and it brought back so many recollections—just here. I am Mrs. Gordon now.' Then she drove off. And now that you have heard all that I know myself, Bessie, I hope you have no objection to my going out on the piazza to smoke a cigar."

Mrs. Marks would willingly have detained him for the purpose of further questioning; but she had an instinct that it would be useless. So she only watched him as he left the room, and then turned to her husband.

"You laughed at me several years ago, Richard, when I said that I did not believe John would ever forget Pauline Morton. Pray what do you say now?"

"Why, exactly what I said then," answered Mr. Marks, looking up from the paper which he thought he should never be left to read in peace. "I say that Warwick is much too sensible a man to be hankering after a woman he was in love with more than twenty years ago; and that—"

"Oh, my dear, hush a moment!—Miss Tresham, will you touch the bell for Letty?—Now, children, say good-night to your father, and go to bed; it is after eight o'clock."

The children were evidently well drilled. They were dying to hear what was next to be said; but they went through the good-night ceremony, and fled off obediently, when a tall negro-woman, in a bright red-and-yellow turban, appeared at the door. It is true, there was a riot in the nursery that night; but no sound of it reached the precincts from which the young insurgents had been banished, for Letty was quite equal to the emergency herself, without invoking aid from the higher powers.

Meanwhile Mr. Marks obstinately declined to canvass any further either the arrival of Pauline Morton or the state of Mr. Warwick's affections—at least until he had finished that article from which he had several times been so ruthlessly torn.

"Those subjects will keep for some night when I haven't got any papers, Bessie," he said, to his wife's infinite indignation—an indig-

nation which she forthwith manifested by taking herself and her sewing over to Miss Tresham's side.

"You never heard much about the Mortons, did you, my dear?" she asked, after admiring the pretty braiding that Katharine was putting on an apron for Nelly.

"I never heard anything," the young governess answered, "excepting that they owned Morton House and lived abroad."

"Ah!" said Mrs. Marks, with something of a sigh; "people don't talk much about things that happened twenty years ago. But oh, my dear, if you could only have seen Morton House when the Mortons lived there, and when Pauline was in her prime! Such troops of servants as they had! such splendid horses! such furniture and such grounds! Why, you can see for yourself, even now, how magnificent the grounds were!"

"They must have been very beautiful when they were kept up," said Katharine, "and they are certainly very extensive."

"I should think so, indeed! Why, there used to be fifteen acres in gardens alone! I remember, when I was a girl, going to a camp-meeting once, where one of the preachers said that the best idea of heaven he could give was that it would be even more beautiful than the grounds of Morton House."

"Why did its owners leave it?"

"Ah, you may well ask! But it was all Pauline's fault. She was so beautiful and so proud that she scorned everybody and every thing here. She was never satisfied unless the house was full of strange company from the cities, and at last she told her parents that she would rather die than live in the backwoods. So her parents, who would have tried to get the stars for her if she had wanted them, left their beautiful home and went to Europe—never to come back, as it turned out."

"Did none of them ever come back?" asked Katharine, becoming rather interested.

"None of them ever came back—until to-day. There was a young brother—only one—who grew up in Europe; and I have heard that he laughed at the idea of returning to America to live. He must have spent money at a dreadful rate after his father's death; for Mr. Shields told John that the crops were always mortgaged before they went into market, and we heard, not long ago, that the house itself was to be sold. If that had been the case, I expect Mr. Annesley would have bought it."

"Why? Is he—"

"A relation? Oh, yes. His mother was a Morton, and as handsome and proud as all the rest of them. She was poor, though, for her father squandered every cent he had. But her uncle always treated her exactly as his own daughter, and people say he settled a very good sum on her when she married. She and Pauline were raised together like sisters; but they never liked each other. I don't know which was in fault; but they made no secret of the matter. For my part, I rather took Pauline's side, though most people were on Elinor's; but Pauline was very generous, with all her pride, and I don't think she ever made her cousin feel her dependence. They even say that Mr. Annesley was Pauline's admirer, and only went over to Elinor after he was rejected. Then there's—O John, how you startled me!"

"I am very sorry," said Mr. Warwick, who had come in upon them unawares; "but I have been waiting some time for a chance to speak, and, as you seemed determined not to give me one, I was obliged to take it.—Miss Tresham, I wonder if you will excuse me when I tell you that I have just found a letter of yours in my pocket, which was left there through the joint carelessness of Katy and myself, and might have been lost?"

The girl looked up at him wonderingly.

"A letter for me, Mr. Warwick? You must be mistaken."

"How often am I to hear that to-night?" he asked, smiling. "I think, if you will look at this address, you will acknowledge that, with all my stupidity, I have hardly made a mistake."

He laid a letter down on the table before Katharine, who either would not or could not hold out her hand to receive it—a letter written on thin foreign paper, stamped with a foreign post-mark, and bearing her own name in clear, legible address.

Not so clear and legible, however, but that it swam before her eyes as she bent over it; and John Warwick was startled by the pallor of the face that raised itself, and by the anguish-stricken tone of the voice that cried out, as if unconsciously:

"Oh, if you had but lost it! if you had but lost it!"

CHAPTER IV.—WHAT MRS. ANNESLEY DID.

It would be difficult to exaggerate the excitement prevailing in Tallahoma—Tallahoma, which was very stagnant just at that time, for want of something to talk about, and which was blessed beyond its most sanguine expectations in the arrival of Mrs. Gordon. The news of that arrival spread rapidly through the village; and, while Mr. Warwick was telling his story at the Marks's tea-table, it would be hard to say how many other tea-tables were entertained by different renditions of the same facts. True, there was a very general and unsatisfactory haziness concerning the why and wherefore that had brought back the wanderer's steps, concerning her intentions, or even her appearance. But, then, these things promised an abundant harvest of gossip for the future; and all-absorbing for to-night was the simple fact that Pauline Morton had returned.

But on the morrow, after there was time for reflection, after the news had spread through the county, after the first shock of surprise was over, and people looked each other gravely in the face, they began to ask, How had she returned?

The answer was not long in coming. She had gone away in the flush of her youth and beauty, guarded by her parents, and with all the pomp of style and attendance which wealth could secure. She returned alone and unattended, with no husband to guard, no brother to protect, no friend to vouch for her—no word of warning, no single order of preparation! She came to her childhood's home and her childhood's friends with no pleasant stir and bustle of happy arrival, but silently and unexpectedly, more like an outcast seeking shelter than a daughter claiming her rightful heritage. Other people besides Mrs. Marks remembered when the Mortons had gone away, and, contrasting that departure with this return, almost involuntarily shook their heads. The first impulse of the world is always to distrust mystery. "Something is wrong," they said; and many of them said it the more readily because Pauline Morton had been one of those shining marks which envy loves, and because in her proud youth she had rather provoked than conciliated such a feeling.

It is exceedingly doubtful whether any state of society has ever existed since "Adam delved and Eve span," when those who were subordinate in the scale of worldly advantage have not felt a sort of carping dislike, and at times a bitter enmity, toward the few whom chance or fortune has elevated above them. We can imagine how the rabble of Athens spoke of Pericles and Alcibiades; we can conceive that hatred which from first to last the Roman plebeians bore their patrician masters; we can guess how bitterly the serfs and retainers, the scorned burghers, and oppressed Jews, spoke in bated whispers of the great feudal lords; we can read how often and how fiercely the great unknown have lashed themselves into fury against some class, some order, or some individual that birth, merit, or circumstance, rendered illustrious; and we can well believe that the same envy which we see manifested in a dozen petty instances every day, the same envy which was tired of hearing Aristides called the Just—has been the great moving spring of many of earth's revolutions, and is equally the moving spring of half the ill-nature and more than half the ill-speaking of the world. To make a small application of a wide truism, it was certainly the moving spring of most of the ebullitions of spiteful spleen in which for many years Lagrange had permitted itself to indulge regarding the Mortons. People more generous, more frank, or more hospitable, than these Mortons, it would be hard to find; but they were of good blood, and very proud of their descent; they were immensely wealthy, and spent their wealth liberally. These two facts were amply sufficient to excite that alloy of popular dislike which otherwise their many good qualities—qualities that even envy could not deny—might have disarmed. Not that they were unpopular in the general sense of the term; not that men denied their genial uprightness of character, or failed to respect them as only the honorable are respected. But they were too prosperous! The world and the things of the world went well with them; Fortune favored them in all their undertakings, while those who were less lucky could only look on and wonder why and how it was. They kept great state, and, although some of the best blood of the country was to be found in Lagrange, still there was no family that quite ranked with the Mortons, to whose wealth and enterprise Lagrange was indebted for much of its prosperity. The oldest and by far the most stately residence of the county was the house which had been built by the representative man of the line—one Hugh Morton of

three generations back. The village of Tallahoma had begun its existence merely as the post-office of this house; and the same house had been for many years the centre of such a lavish and refined hospitality that its reputation spread far and wide throughout the entire State.

Considering their social importance, then, it was no wonder that all Lagrange was thrown into a commotion when it was announced that Mr. and Mrs. Morton were going to Europe, ostensibly for their son's education, but really to gratify their daughter's whim—the daughter who was accustomed to say that life in America was worse than death, who panted for the rush and fever of the Old World as ambitious men pant for fame, and to whom it was solely due that her indulgent parents went abroad, leaving their noble home to pass into decay while they dwelt in Parisian hotels and Neapolitan villas. She had the more easily compassed her point because there was no one of sufficient moral force to resist her. Some men—most men, in fact—would have been utterly lost in the *dilettante* existence thus forced upon them; but her father was just the exceptional man who enjoyed it. If he had been born among the lower classes in Spain or Italy, he would have spent his life on a door-step basking in the sun; and, as it was, he spent it in morally doing the same thing. He was frank and generous to a fault; but he was intensely indolent, pleasure-loving when the pursuit of pleasure did not involve too much trouble, and fond of ease and luxury to an almost womanly degree. Mrs. Morton, for her part, was bound up in her daughter's wishes and her daughter's triumphs, with a great sympathy for both, and a great liking herself for the things that were so attractive to Pauline. The only son was a mere child. So, with none to put an obstacle in her path, Pauline's impetuous will carried the day. The desire of her heart was granted her, as the desires of our hearts are rarely granted to us here on earth; and, when she took her life in her own hands and went her way, it was as some gallant ship sails away from a familiar harbor to cruise in unknown seas, where happiness and fortune may be attainable, but where shipwreck and disaster are much more likely to be encountered.

For some time after the departure of the voluntary exiles, fragmentary news came back of their wanderings; of their cordial recognition by the English relatives they had partly gone to seek; of Pauline's fresh triumphs; and of their glittering life in foreign cities. But all this was very vaguely told, and soon ceased altogether—fifty years ago the country-districts of America were farther removed from such scenes than is the interior of China to-day. Soon all tidings of the Mortons ceased, and before long the Mortons themselves might have been forgotten, had not the house which bore their name and seemed gloomily mourning them, stood as a perpetual reminder of their existence. Only at long intervals certain items of intelligence still gratified the gossips of Lagrange. First came the tidings of Mr. Morton's death; then news of Pauline's marriage to some one, who was variously represented of every imaginable nationality and rank; and, lastly, the announcement of her mother's death. Then silence fell, silence complete and unbroken, although the county leader of fashion, handsome Mrs. Annesley, was first cousin to the surviving brother and sister, had been reared in their father's house, and married from it. But everybody knew that Pauline had never liked her cousin, and that it was a happy day for both when Edgar Annesley (who was killed in a duel a few years later) took his bride from the door of Morton House.

Remembering all these things, a thrill of intense interest and surprise ran through the county when Lagrange heard of Pauline Morton's return. There was not a family of good rank within its borders that did not own some connection of blood or ancient friendship with Morton; and not a family, therefore, which was not personally interested in this unexpected arrival. Still even these people paused and looked at each other full of doubt. If Pauline Morton had come back among them with the state which, to their imagination, was always associated with the name; if she had thrown open the old hospitable doors, and lighted up once more the old hospitable rooms; if she had bidden her friends around her, and asked their welcome with the matchless grace they still remembered—they would have been the last people in the world to question whence she came, or why she chose to shroud her past life in mystery. But the singularity of her course awakened in them the first chill of suspicion. Why come back in this way to her own house? Why write no letters? Why give no warning to the friends who had a right to know of her inten-

tion? Why ask no aid from their support, she coming back so strangely alone to claim her old position? Why offer no explanation of her marriage and widowhood? Why think that her old acquaintances would take for granted the twenty years passed away from them—the twenty years in which she might have climbed any height, or plunged into any depth, unknown to them? Truly it was no wonder that the elders among them shook their heads; and truly it did not look as if Pauline Morton had come back to win any very warm welcome from her kinsfolk and friends.

Yet among the former class was one person at least to whom no neutral position was possible, one person on whom the burden of positive action was incumbent, and from whom every obligation of gratitude that the world counts binding commanded a speedy and cordial welcome to the returned wanderer. This person was Mrs. Annesley; and yet her worst enemy—if, indeed, the handsome, charming lady owned any enemies—could not have contrived for her a more disagreeable surprise than the news of her cousin's arrival proved. When she heard the particulars of this arrival, she turned very pale; and then—went to bed with one of those bad nervous attacks which always stood her in such good stead when an unpleasant exertion was demanded, or an unpleasant duty was to be performed. She deplored this necessity very pathetically; and assured the friends who came to see her that she was especially sorry because she could not go at once to meet and welcome "dear Pauline." But these friends were by no means obtuse; they understood the matter perfectly, and told each other when they went out that it was evident Mrs. Annesley felt very awkwardly about meeting her cousin, and that they did not wonder at it.

"It is unfortunate that I should be ill just at this time," Mrs. Annesley said to her daughter, Mrs. French—a pretty, fashionable-looking girl two or three years younger than her brother Morton, and lately married—on the evening of the day when these visits had been paid. "I certainly ought to see Pauline at once, and it is quite impossible for me to do so. Yet people will be sure to think it very strange."

"Mrs. Raynor told me to-day that everybody is waiting to see what you mean to do," Mrs. French answered. "If I were you, mamma, I would let them wait. A woman who comes back like this does not deserve any consideration."

"I am not thinking of her," said Mrs. Annesley, truthfully enough.

It was a little before dark, and the mother and daughter were quite alone in the chamber of the former. With the outside world it was still daylight, but here the shades of twilight had already gathered, deepening in all the nooks and corners of the room, and only dissipated by the ruddy glow which a bright wood-fire cast over the polished furniture and the softly-tinted walls. On one side of the hearth sat Mrs. Annesley in a deep arm-chair. Her cashmere dressing-gown, her dainty lace cap, and her velvet slippers, were all perfect; for she had made a tasteful invalid toilet in expectation of those compassionate visitors who had just departed. Opposite, and if possible in a still more luxurious attitude, Mrs. French was sitting—the firelight flickering over her silk dress, and glancing back from her gold *châtelaine*. She had been busy with some netting; but the rose-colored web had dropped in her lap, her hands were loosely folded over it, and her eyes were roving absently from the fire to her mother, and from her mother to the heavily-draped windows that commanded a view of the lawn before the house, and the belt of dark shrubbery beyond. Finally, she said, languidly:

"It is a good thing that Morton is away."

"It is a most fortunate thing," answered Mrs. Annesley, with energy. "Morton is so Quixotic in his ideas that there really is no counting on him, and he is so unfortunately straightforward that he cannot understand the delicate management which some things require. I am sure he would give me trouble if he were here—so I agree with you, Adela—it is a good thing that Mr. French wrote for him just now."

"It will be at least a fortnight before he can get back," said Adela, who had been making some calculation of time and distance while her mother spoke. "Perhaps it may be longer, if Frank decides to come with him, as I hope he will. Then I shall keep him here until I am ready to go back to Mobile."

"It is very provoking that you should need to go back," said Mrs. Annesley, pettishly. "I shall never be satisfied until you are settled

in Lagrange. If I could only carry out my plans! If you could only live here—"

"Frank would never consent to it, mamma," interrupted Adela, placidly. "He says, very truly, that Morton will be marrying some day, and, of course, bringing his wife here; and, then, the arrangement would never do."

"Of course, there could be no question of it under those circumstances—that is, if Morton decided to make this place his home," said Mrs. Annesley. "But that was not my plan, Adela, as you very well know."

"I know you thought of Morton House for him, and Annesdale for us. That would certainly be very nice. But I suppose we must give up all hope of it now."

"That remains to be seen," answered Mrs. Annesley, quickly. "It is almost beyond patience," she went on, "that this woman should come back now to defeat all my plans. Every thing was so well arranged. Alfred Morton was perfectly willing to sell the house, and Morton could well afford to give even the exorbitant price he asked. It is true that for the same amount he could have bought the finest plantation in the State; but then no other place could be to him like that—his great-grandfather's house. Nobody knows how my heart has always been set on this. Ever since Morton was a child, I have counted on seeing him owner of Morton House. It seemed to me it would even make amends for all I once endured in that house, to know that my son was master there. And now this kind cousin, who always hated me, has come back—simply to disappoint my wishes."

"It would be very nice," said Adela, whose mind was still bent on the arrangement, as it affected her own comfort. "Frank and I could settle here, and I need not trouble myself any more about his disagreeable relations in Mobile. Morton could marry Irene Vernon, and live in that tumble-down old barn that you have such a fancy for; and you could have your rooms at both places, and visit between us, just as you liked. It is a pity that one of your cousins took it into his head to die, and the other one to come back just now."

"Gordon!" said Mrs. Annesley, slowly; "Gordon! I am confident that I once heard the name of the man Pauline Morton married; and, if I could recall it now, it might be worth remembering. I am almost sure—as sure as I can be of any thing which did not dwell positively on my mind—that it was *not* Gordon."

"Goodness, mamma! Has she come back under a false name?"

"I am not certain, of course; but my own impression is that she has. Don't mention it, though, Adela. People are talking enough about her already, and we need not circulate a fact which undoubtedly looks very badly."

"You may be sure, mamma, that nobody ever acts as she is acting without some reason for it."

"There is no doubt of that," answered Mrs. Annesley, with a sudden flash of something like triumph in her eyes. "But it does not surprise me in the least—nothing that I could hear of her would surprise me. Her pride and insolence were so great that they paved a fall for themselves. Times have changed, Adela; you don't know how strangely it makes me feel to realize that twenty-five years ago Pauline Morton was the queen of Lagrange, and to-day it is doubtful whether there is a single person of good position in the county who will move an inch to welcome her."

"It all depends on you," said Adela, in her languid way. "Mrs. Raynor told me that. She says that everybody is in doubt what to do, and they mean to wait and see how you will act."

"There, again, times have changed," said Mrs. Annesley, gazing into the fire. "Twenty-five years ago I was the dependent cousin whom Pauline Morton barely tolerated; and to-day it seems that here, in her own home, the question of her social recognition depends on me."

"It depends on you how people will receive her," said the matter-of-fact Adela. "If I were you, mamma, I would let her see this, and then—you might perhaps make your own terms, and get Morton House after all."

Mrs. Annesley gave her daughter a glance, and laughed a little.

"You are tolerably quick-witted, Adela, and would make a pretty good diplomatist. Certainly, I don't owe Pauline much, in the way of a good turn; and certainly, also, the advantages of the situation are on my side now. If Morton is not the owner of Morton House yet, you may be sure that it will not be my fault. By-the-by, did Mrs.

Raynor tell you any thing of those reports we heard about Pauline several years ago?"

"Nothing at all, mamma, for she did not seem to know any thing. She said there had been reports, but that they were very vague, and she had never been able to make much out of them. She said, also, that you would not speak of them; but she was sure you knew more about the matter than anybody else."

"She is mistaken," said Mrs. Annesley; "I know nothing about it. How or with whom the reports originated, I cannot tell; and, simply because I did not choose to contradict them, people took it for granted that I believed them and was well acquainted with all the particulars."

"I expect you looked as if you believed them. That is a way you have, mamma."

"I certainly could not look as if I did *not* believe them, when they were so entirely in keeping with Pauline Morton's character," answered Mrs. Annesley, a little coldly. "She was always imprudent and reckless to the last degree. If she has learned wisdom, it has been since she left Lagrange.—Will you ring the bell there, Adela? I must order some chocolate for my supper; coffee keeps me awake, and is bad for my nerves."

The bell was rung; the chocolate was ordered; the servant who received the order delivered a message to Mrs. French about some household matter which demanded her presence down-stairs; and, with the regretful sigh of an indolent person, the lady tore herself from her comfortable lounging-place, and departed. The door had scarcely closed on her, when Mrs. Annesley rose and walked to the window. The dusk had fallen by this time, and she could not do more than distinguish the outlines of the familiar objects before her—the piazzas and wings of the house, the graceful trees and well-trimmed shrubs that were scattered over the gently-sloping lawn. Every thing at Annesdale was in the most perfect taste; but every thing was undisguisedly new, and just now Mrs. Annesley's heart was longing for something which was old. Her husband had begun, and she herself had completed, the house in which she stood; yet, charming as it was in every appliance of luxury and comfort, her perverse fancy went back to the stately rooms, dark and mellow with age, where her youth had been passed. She looked steadfastly out of the window, over the trees and shrubbery which her own hand had planted, beyond the dark woods and broad fields, until she saw—in imagination—the noble oaks of Morton House, and the tall chimneys, from which, for the first time in twenty years, the smoke of household fires was curling upward. Then her brows contracted in a slight frown—a frown not sufficiently marked to darken the handsome face, or give a severe aspect to its smooth lines. "Times are changed," she said, once more, but this time only half aloud. "Will she recognize that as plainly as I do, I wonder? Will she see that, indeed, the advantage is with me now, and that it is for me to decide whether Pauline Morton—the beauty, the heiress, the belle of Lagrange, twenty-five years ago—shall not be a social outlaw in Lagrange to-day? whether, six months hence, Morton House shall not be in my Morton's hands?"

Before long, Mrs. French came back, and found her mother sitting as quietly as ever beside the hearth, in the dim, fire-lighted apartment. The two ladies spent the evening together, and, when they separated for the night, the last thing Mrs. Annesley told her daughter was that her inconvenient illness would at least serve one good purpose, in enabling her to see what other people meant to do in the case of her cousin.

Several days elapsed. Then she found that Mrs. Raynor was right, and that other people had made up their minds to the same masterly policy of inaction which she herself had been practising. So, urged partly by this fact, and partly by a growing fear of her son's return, she became suddenly convalescent, thought a drive might benefit her, and ordered the carriage.

"I won't ask you to accompany me, Adela," she said to Mrs. French. "If I should go to Morton House, the meeting would, of course, be very painful on both sides, and had better be as private as possible. Besides, I don't care to draw you into a connection that may prove a very awkward one. Frank might object to it."

"Frank is not of any importance," said Frank's wife, carelessly. "But I wouldn't think of such a thing as going—not for the world! I hate disagreeable people, and this Pauline Morton must be very disagreeable. Don't tell her I am here, mamma—I beg you, don't do that!"

"I am not sure that I shall go to Morton House," said Mrs. Annesley. "It depends on how I feel," she added, gravely, as she went down the piazza-steps and entered the carriage which was drawn up before them. "Mrs. Taylor's, John," she said to the coachman, who stood waiting his orders. And, as the carriage drove off, Adela, who was still on the piazza, saw her lean back and put her *vinaigrette* to her nostrils.

Her point of destination was not more than two or three miles from Annesdale; so she had not time to feel her nerves in any unpleasant degree before the mettled horses swept up to a red-brick house, set in the midst of a bright-green lawn, with a brilliant hedge on either side, and an ornate fence in front. Here the languid invalid was warmly welcomed by Mrs. Taylor and some half-dozen daughters, whose ages ranged from fifteen to thirty, and whose ugliness was from comparative to superlative degree. Mrs. Taylor was a widow; her daughters were all unmarried; and, since country-life is stagnant at best, and a large household composed exclusively of women must certainly bestow its energies upon some employment, the Taylors, mother and daughters, were widely famed for devoting themselves, like the Athenians of old, to "telling and hearing something new." Their house was the headquarters of all news (reliable or otherwise) which was afloat in Lagrange, and the mint where all reports were stamped for current circulation. If Mrs. Annesley had wished to put her finger on the public pulse, and feel how strong or how feeble were its beats on the Morton question, she could not have chosen a better place for the purpose.

Perhaps this had been her intention. At all events, when she left the red-brick mansion behind, and was on the high-road, she gave the order, "Morton House."

[TO BE CONTINUED.]

ANNETTE LORN.

THE windows of my quiet little domicile in Thirty-fourth Street look out in the rear diagonally across on Seventh Avenue, and I have only to settle myself in my arm-chair by the window of my study, and contemplate at my ease a peculiar phase of character and mode of life; for tenement-houses of the better class stretch along Seventh Avenue to Thirty-fifth Street, through whose open windows I can glance and see the inner-life of the occupants.

One day, several months ago, when I first commenced my studies of social life in the Seventh Avenue, I noticed one window in particular, where, on a projecting ledge, scarlet geraniums and pink-and-white roses bloomed, and where rude boxes were covered with running flowers and trailing moss until they looked like pyramids of freshness and greenery. I was often attracted to this window, and I noticed that the curtains were always scrupulously clean, and the bit of bed which showed from the window had pillows of snowy white.

Now and then a pretty brunette appeared at the window, sometimes looking bright and *riant*, and anon with a shade of deep sadness on the piquant face, with its full red lips and *nez retroussé*.

One day, too, I heard a clear young voice, as it floated on the still evening air, singing an old French *chanson*. My thoughts flew back instantly to the French *pension*, where I was once one of those prisoners politely known as parlor-boarders, and where one of the governesses used to sing the same air. She had learned it in her own sunny Provence, in the days when René, her dark-eyed lover, had given her the string of beads, "of pure gold, *mademoiselle*," to hang on the shrine of her patron, Saint Agnes. Vain propitiation! René died behind the Paris barricades, in the fatal days of the *coup d'état*, and the loved one was a little wizened old maid, with one green spot in her heart—his memory, kept fresh and watered by her tears.

I had seen her sit in the still twilight, with the tears rolling down her cheeks, singing the song which brought back her youth and love again. It had affected me much, and now, when I heard the pretty brunette singing it at the window, I listened eagerly, while the young voice trilled and thrilled like a bird's. It did not sound sadly when she sung it. It seemed as if the voice of hope breathed through the fresh red lips. Ere the song died away it was taken up, and a deep, manly bass added itself to the air.

There was no great cultivation in either, but both the voices pos-

sessed the charm of youth and freshness. I could not see the man, but I concluded, on a venture, that he was the lover of the pretty brunette. I got up a vague interest in her, and it is so seldom I am interested in any thing between heaven and earth, that it was quite a boon to me.

I don't see how a woman can exist without women friendships; but, beyond a few "called and chosen," I don't take violently to my own sex. When I do take a fancy of this sort, however, I have it "awful bad."

The little brunette interested me, and, as long as she did so, what mattered it whether she were patrician or plebeian, princess or pariah? I can't imagine any situation in life where it could possibly pay to be bored, and these "high people" do occasionally bore one fearfully.

I wondered what made the face in the window, so bright naturally, wear sometimes such a shade of sadness, and I wished that I could waft some charm through the air to drive that shade away.

Of what avail are clairvoyance, and magnetism, and spiritualism, if they cannot give us power to lift the shadows from one human heart?

One day, through my little blue-velvet opera-glass, I saw the girl busily engaged over a table with some white fabric, and, looking still closer, I found she was fluting.

How fortunate! She flutes, and I want some fluting done.

That afternoon, when I went out to get a paper of pins, or to buy a new neck-ribbon, or some one or other of the glorious ends and aims with which we women employ our minds, while our brothers, with no more intellect than ourselves, are making and losing millions, and deciding the fate of nations—when I went out on one of these tremendous errands, I stepped round to the Seventh Avenue, and, passing by the array of party-colored garments, breeches, coats, hats, petticoats, dangling in wild confusion before the everlasting old clothes-shop, I went to the side-door, and asked a clean, sharp-faced woman who was mopping up the staircase, who "did fluting" in the house.

"The laud's sake, how should I know? I'm only here a few days, and am clean tuckered out a' ready, trying to keep the stars clean, after a passel of dirty Jews and Irish."

Without pausing to ask her how she left her "folks" in New England, where she evidently drew her natal breath, I ran up to the third floor, and, on a door, in the narrow, half-lighted passage, I saw the sign:

"ANNETTE LORN,
"Seamstress and Fine-Laundress."

I knocked at the door. A French child, with auburn hair and a face clean, though homely, presented herself.

"I wish to see the person who flutes."

"Que voulez-vous, madame? Je ne parle pas Anglais."

I repeated my wishes in French, and the little girl went into an inner room after her sister, while another child, a youngster of three, came and stared at me with his great blue eyes.

I glanced around the room. There was a rag carpet on the floor, and a half-dozen cane-bottomed chairs ranged around. An old-fashioned sideboard held a few old pieces of china, some silver spoons, and a silver cup; and, in addition to these, there were some books, and a decent picture or two, little relics that seemed to tell the saddest of all histories, that of a family who had seen better days. There was an inexpressible neatness and cleanliness about every thing, and a pleasant perfume from the flowers in the window filled the room.

Presently the pretty brunette appeared with a bowl of broth in her hand. She bowed again and again, and smiled, her manner having that graceful, suave politeness which is a charm peculiar to the French of all classes.

"Pardon, madame, I have been giving my sick mother her broth. So sorry to keep madame waiting a moment."

"I don't mind waiting a little while. I want some fluting done, and also some plain sewing. Can you come to-morrow for the sewing?"

"Yes, madame."

"I prefer that you should do it at my house."

"As madame pleases. My mother is better this week, and I can leave her through the day to Blanche."

"Very well, then. Come to-morrow."

The young girl came the next day. Her day lengthened into a week, and then into two. Her grace and *naïveté*, her perfect propriety of deportment, and manner far above her station, interested me more and more, and made me pity her also, for it is a misfortune to be forced into any sphere of life, high or low, where we do not of right belong.

I sometimes noticed the same intense sadness on her face that I

had before observed. Her manner at such times was *distracte*, and her fingers trembled nervously over her sewing. One day she came in looking pale as marble, and oh! with such a melancholy look in the tender brown eyes.

As she fitted a robe over my shoulders, I felt the touch of her fingers like ice upon me. I turned, impulsively, and took the cold hand in my own.

"Annette, you are in trouble. I know you are. Will you tell me what it all means? I will help you, if I can. Don't be afraid to trust me. I promise that I will be your friend."

"Oh, madame!" and with that she sunk on a sofa, and broke into sobs.

"What is it, Annette? Come, there is no sorrow without a remedy, though the one that suffers cannot always perceive it."

"We are so poor, madame, so poor!" she sobbed out, despairingly; "and my mother is an invalid, and she and the children must live by my work. My father has been dead three years, and it has been my care to support them since then."

"Good Heaven, Annette! and have you none to assist you?"

"None, madame; but, somehow, we have got along. We French can live on so little. A cup of coffee, a little soup, an onion or two, a bit of fruit. The saints be praised, we have never yet suffered from cold or hunger, except one Sunday—shall I ever forget it? My mother had been too sick all the week for me to do any thing but nurse her, and work was scarce, anyway. It was a cold, dark, dreary Sunday, and the rain kept pattering down, but it did not fall faster than our tears. But after a while Gabriel came, like a good angel, and it was all right then. My mother don't like Gabriel, but she was glad to see him that time, for he brought us fire, and food, and warmth."

"And Gabriel, is he the young man who sings 'La Reine d'Amour' with you?"

She blushed, but answered, with simple frankness, "He is the man I love, madame." And, saying this, she took from the pocket of her neat little muslin apron a photograph, and handed it to me.

I looked at it. It was the face of a man of the people, with no very fine lines, or great expression of intellect in it, but round and good-humored, and with a certain energy in it, too. Judging from that glance, he was the very sort of man to succeed in a country like this.

"This is your lover, Annette?"

"Yes, madame, and that is my worse trouble of all," she replied, breaking into fresh tears.

"Why so? Have you quarrelled?"

"Ye—yes—we—we have."

"Is it only this? Why, lovers quarrel every day and are reunited. He will come back. You can recall him."

"Oh! No, madame, I cannot. My mother—"

"Your mother—what?"

"She will not let me marry Gabriel. She says he is a good-for-nothing. Besides, there is another, who is a mechanic, who has plenty of work, and who says he will keep me like a lady, and take care of my mother, and perhaps I ought to marry him—sometimes I think so—but I do love Gabriel so."

"What does Gabriel do for a living?"

She hesitated, but finally answered:

"He was on the police-force, but—but—indeed, madame, I am ashamed to tell you, and yet it is a comfort, too. The fact is, my mother made me slight Gabriel, and he grew very jealous of—the other one, and it drove him wild, you see."

"He has been dismissed, then."

"Alas! yes—"

"For what particular offence?"

"Oh, madame, he—he—was found intoxicated on his beat, and they broke him at once."

"Annette, I know it is painful to you to answer; but I am asking these questions for a good purpose to you. Is he habitually dissipated?"

"Oh! No, madame. He says he would never drink, only for the way I treat him."

I could not help smiling. I wonder if there ever was a man who did not lay his own imprudence and excesses at some woman's door?

However, it was no smiling matter.

Between her struggles for life, against wind and tide, the care of her invalid mother and her separation from the man she loved, Annette's cup was full.

"I will go and see your mother, Annette—see if there is any thing I can do for her, any little necessities that I can provide; and as for Gabriel, if he is of any account, he can support himself and you too. Brighter days will come. Cheer up, and be of good courage."

The next day, in pursuance of my design of helping Annette in her trouble, I went over and assailed her mother. I found her a thin, dark, little Frenchwoman, with keen black eyes, and a hard look about her face. On her head was a neat, French cap, and every thing about the clean, deftly-arranged room showed the marks of Annette's tasteful fingers. In one corner of the room was a shrine covered with spotless white, and surmounted by a plaster statue of the Virgin, before which burned two wax candles, and bloomed a few fresh flowers from the boxes in the window. Here the young girl told her beads, and sent up her guileless orisons to Heaven.

Under cover of a bottle of old sherry and a pound or two of butter-crackers, united to the tenderest expression of regard for her health, I made my approaches to the old woman, listening sympathetically to her long account of one of those cases of woman's suffering which seemed to baffle the skill and knowledge of those men who call themselves physicians. She repeated to me how Annette, during three years, had been her sole support.

When I alluded to the heavy burdens thrown on Annette's young life, the mother shed no tears; she had grown hard in the world's hardest school—poverty, and I saw that Annette's youth, energy, and talent, were regarded, by the mother who bore her, simply as so much stock in trade, to be turned to the best advantage.

"She could marry, madame, and throw off these burdens that you speak of. There is one fine young man, good, industrious, that will marry Annette and take care of me. But the girl is perverse. I cannot manage her. She thinks of nothing but that good-for-nothing Gabriel Bernard."

"Is Gabriel, then, so good for nothing?"

"What else is he, madame? Is he not out of a place these six months? What got him off the police but his own bad conduct? Let her do what she will, she shall not marry him!"

"But if she loves him?" I ventured.

"Oh! love, madame, love is a girl-and-boy's dream. I never loved my poor Pierre Lorn" ("Candid," thought I), "but we got along well enough, and he made me a comfortable living while he lasted. That was better than love and starvation in a garret."

"The world's logic," I thought, disconsolately, as I rose and bade adieu to the implacable parent. I visited her afterward, but found it in vain to try to soften her. I told Annette to send Gabriel to me, that I might judge for myself what material he was made of. One day he presented himself. He was better-looking than his portrait, and there was a certain air of self-respect and a courtesy of manner in him, that I liked. He was well dressed, too, and I saw but little essential difference between him and men far above him in rank. Nowhere but in America could you have found such a gentlemanlike, self-possessed young man in his station. I was glad, because I should have felt too sorry to have seen the young girl whose beauty, misfortunes, and lovely character, interested me so much, ally herself to one much her inferior.

It was evident Gabriel was not a bad fellow at heart. He was one of those natures without great moral courage or heroic force, but generous, impulsive, and open-handed—the very sort to go to the bad when driven thither by any outward pressure. He confessed his devotion for Annette, and declared it "was the trouble he'd had about the girl that drove him to dissipation."

I promised him that, if he would pledge himself to me to do his duty like a man and a Christian, I would see some friends of political influence, and endeavor to have him reinstated.

He gave me his pledged word, and had scarcely departed, when, in that singular *à propos* way that things sometimes occur, Judge H—, a lawyer who was transacting some business for me, was announced.

Knowing his great influence, and thinking of the young lovers, I welcomed him with such *empressment*, that the old gentleman was quite astonished.

"I have no very good news for you," he said, hesitatingly. "I find the Ninth-Avenue Railroad business is all in a muddle, and the suit for thirty thousand against the P— Bank has gone dead against you."

For a moment I sat silent under his news. I thought of my lost husband; of his hard labor and toil far into the night; of the cases

won for this bank under the greatest difficulties, the ablest opposition; I thought of the insufficient fees, the long waiting, and now I was to be robbed of that which I knew was in justice my due.

At last I answered, bitterly: "I might have known it would be so, as justice is administered in New York. With a woman and a widow on one side, weak and desolate, and an association of rich men on the other, it was easy to foresee the decision."

The judge sighed in sympathy.

I listened silently while he talked over the weary details of my business affairs. I am one of those persons who have received one so great a blow that all others seem light by comparison.

When he was through, I roused myself from my depression, and made an effort to interest him in the fortunes of my poor little *protégée*. Yet I thought of her, as I did it, with a vague envy. She was lovely, loving, and beloved. Fate had never thrown into her path all that woman's heart or ambition yearns most wildly to win, only to tear all from her grasp in the hour of sweetest fruition.

The judge was very good-natured, and promised to do all I desired, if possible.

When I told the lovers that I had spoken of Gabriel to Judge H—, and when Gabriel himself had had a favorable interview with that gentleman, they were elate with hope. The very next day I received a letter from the judge, notifying me of the appointment of my *protégée* to a post on the Central-Park police-force, and the next time I saw Annette she stood, crowned with orange-flowers, in the sweet religious gloom of a Catholic chapel, while the low, tender chant of a nuptial hymn arose on the air as the good priest finished his benediction.

The mother, who had finally given in, when she found Gabriel could bring grist to the mill—the mother, to whose illness, importunities, and exactions, the young girl had devoted three years of her bright youth, died suddenly of diphtheria, about a fortnight after her daughter's marriage—strangled to death.

The young couple are keeping house in a flat, in a house overlooking the park, and if you could only know how pleasant it is there; if you could only see how snowy the lace curtains, how faultlessly neat the cottage furniture with its pretty white covers, how inviting the tea-table, with its two little china cups and its bits of plated ware, as bright as hands can make them, and if you could see, more than all, Annette waiting for Gabriel, and making tender little signals to him from the window, when he is near enough for her to see him, in the beautiful walks of the park—Annette, in her French cap and tasty chintz frock and snowy collar—if you could see it, you would think it quite an idyl of love for this great crowded city, which stifles out of life so much that is tender and true. She has not forgotten to care for her little brother and sister. Blanche is to be educated at a public school for a governess, while that boisterous, shouting, mirthful, blue-eyed imp of three years is to (when he is old enough) aspire to the dignity of those boys of whom an old lady spoke at Stewart's, one afternoon, "Why, dear me! how many boys by the name of Cash! What a fine family of sons that Mr. Cash must have, to be sure!"

A WEEK AT BATAVIA.

BY THE MARQUIS DE BEAUVOIR.

Batavia, 10th November.—The last inhabitants of Australia of whom we took leave were cannibals, with black skins and carrying poisoned arrows: the first to receive us on the soil of Java are Dutch custom-house officers, pale and fair, dressed in brilliant uniforms, and bearing huge bunches of keys. They softened for us the transition from savage to civilized life by the ruthless opening of our boxes and entire upsetting of their contents. Under the great shed of the custom-house, some four hundred chocolate-colored porters, with bare chests, scarlet sashes, and green turbans, fight for our luggage, and carry it off at a run. My anxious glance follows a certain hat-box, with a cluster of sixteen coolies clinging wildly to it, yelling with all their might, and finally becoming lost in the crowd.

We get, two and two, into some charming little open carriages, which seem to abound here, it being essential to the dignity of a European never to go on foot. Each is drawn by Liliputian ponies, like Newfoundland dogs, brought from the island of Timor, with close-cropped manes, and knowing little heads, and who go a tremendous pace. The eccentric-looking coachmen who goad them on with voice

and whip are Malays, wearing red-and-yellow striped hats, like enormous bell-glasses, which shade them entirely. In this manner we pass at a gallop through the old town of Batavia, built on the unhealthy mud of the sea-shore. Here there are only the dwellings of the natives, and a good many counting-houses, whose old-fashioned gable-ends recall the Dutch buildings of the last century, and contrast curiously with the luxuriant verdure of tropical vegetation. In these lanes plenty of Chinamen are to be seen with their conceited strut, rich dandies of the Celestial Empire, with heads well shaved, and tails so tightly plaited that they always make one long pull to them. A Malay shades them from the sun with an immense sky-blue umbrella. For more than three-quarters of an hour our drive continues, and we pass by the most novel sights. We skirt canals, where groups of thirty or forty Malay women are bathing, and are suddenly startled in their gambols by a *piroque*, heavily laden with fruit, moving silently along by the aid of its languid paddles. Here comes a troop of native cavalry, trotting "*à l'anglaise*," their swords, as tall as their horses, trail upon the ground; their long spears touch the plumes of the cocoa-nut trees: these Malays, with their gingerbread complexions and hanging lips, are dressed up as European soldiers, and their bare feet decorated with magnificent spurs intended for jack-boots. There, numbers of itinerant merchants, adorned with "*langoutis*"* of the most vivid colors, traverse the streets at the peculiar trotting pace common to Indians, gesticulating, apostrophizing the passers-by, and laughing loudly. It is the most bewildering, the most picturesque, the liveliest crowd I ever saw. It would take me hours to describe its thousand colors, the inconceivable specimens of humanity that compose it, its noisy pantomimic animation. But soon we cross a bridge and enter the new town. Oh, what a garden of fairy-land, what a verdant paradise this is! Literally speaking, there are no streets in Batavia; there are only splendid avenues shaded by the most beautiful and luxuriant trees, which form immense long bowers, such as in Europe are only seen in a scene at the opera. The fiery rays of a pitiless sun can only at intervals penetrate this shade, but they deck all that forms it with marvellous hues: the many plumes of the cocoa-nut tree; the slender branches of the tulip-tree, which are all flower, and scarlet flower; bananas, with their green leaves as large as a man; cotton-trees, covered with snow-white tufts; the travellers' palm, great fans of the most exquisite grace, from which a stream of a milky fluid springs, if you pierce the trunk; finally, immense banyan-trees, from which hundreds of creepers fall straight down, and, taking root almost as soon as they touch the ground, climb again to the summit of the tree, twining round it in knotted garlands, only to fall again! One of these trees alone forms a forest surrounded by a curtain, a net-work of interlaced foliage and flowers, through which children in a state of nature, putting on one side the hundreds of creepers waving in the wind, can look at the boats and the swimmers passing along the canal.

The greater part of these bowers of the tropical Babylon are, in fact, only the foot-paths to the "*arroyos*," the great water-ways, which the Dutch would certainly have formed by hundreds, in recollection of their mother country, if the Malays had not already made them in thousands. Thus the instincts of the white race from the north and the yellow race of the equator coincided. The greatest navigators and the greatest pirates in the world cut up their soil into innumerable islets, and the canals in this town are the veins by which circulates their whole commercial life. Another many-colored bower, therefore, to our left, shades the arroyo on whose opposite shore we are driving. I cannot take my eyes from the innumerable vessels that traverse it; the laughing groups paddling in the water, the tufts of water-lilies blooming there. To the right—through clumps of coffee-trees, nutmeg-trees, vanilla-trees, and tamarinds—we catch glimpses of lawns in fairy-like gardens; and, in the distance, the white palaces and green verandas of the European nabobs. I had seen nothing but these avenues and villas, and fancied myself in some delightful suburb of the city, when we found ourselves at the hotel, "*der Nederlanden*," which, it appears, is in the centre of Batavia; so that this blossoming wood is the town itself! I am in such ecstasies with it, I can hardly believe my eyes. By the beard of all the monkeys with long tails or short that I have yet seen, I swear that it is impossible to describe to you my amazement and admiration! Our new dwelling is situated in the midst of a garden, and sheltered by large trees. The principal building, which is of marble,

is supported by an airy colonnade, into which it opens on all sides; on the side of the street and the canal is a circular veranda, where officers, grown thin from the heat, are lounging in cane rocking-chairs. On the opposite side a great oval-shaped kiosk, open to all the winds, but protected by a light roof from the sun, serves as a dining-room. Some sixty Malay servants are swarming like ants to lay the table there. Nothing can be prettier than their long robes, made of red cotton or silk, their blue turbans, and yellow sashes, set off by the whiteness of the balconies and the pavement. Two long wings, of one story only, with verandas and colonnades, enclose the gardens commanded by the kiosk. Here are our rooms, and on entering them we feel a real sensation of freshness, a delicious temperature compared to that outside; there, in fact, the thermometer is at 114°, and here it is kind enough to go down to 102°. It is five o'clock in the afternoon; good Heavens! what will it be to-morrow at noon?

If the flowering trees of this terrestrial paradise are the most characteristic beauties of the town, the marble basins for bathing are certainly the greatest charm of a Javanese hotel. In less than ten minutes after alighting at the "*Nederlanden*," I had got to the end of the colonnade, descended a few steps, and was enjoying in the whiteness of basins the voluptuous delights of an abundant shower manufactured by a Malay, who pumped the water by a regular movement up to the ceiling, whence it fell again to inundate me. I should have remained in my bath to all eternity if the patience of these placid Malays had not exhausted mine. Two attendants, in fact, had insisted upon following me, and, crouching down some four yards off, were waiting till I was pleased to condescend to require their soft towels; and, besides the man who pumped, a fourth man in a red robe offered me a basket full of mangoes, red mangosteens, whose inside is like pink snow, and the perfumed little-known bananas.

In the evening we dined in the kiosk; round us a many-colored noisy crowd danced under the big trees, from which hung Venetian lanterns. From time to time, among the red vests and green robes, a wealthy Dutchman passes languidly along in loose white garments, preceded by the light of an immensely long cigar. We are waited upon by the whole troop of Orientals of whom I spoke just now. I have a Malay to supply me with iced-water, which he pours out at arm's-length; there are two to change my plate; three to bring round the dishes; one carves; another is awaiting the moment for coffee. I believe if I wished for a dozen dishes, and particularly if I could call for them in the native dialect, I should give employment to the twelve men in red who stand behind my chair! What a charming effect all this variety of colors has on this beautiful evening, with a bright light shining upon them! And when, lazily stretched under the veranda, enjoying the balmy evening breeze, I call "*Sapada, cassi api!*" immediately one of these Arabian Nights figures, whom one is tempted to call slaves, advances from the column, at the foot of which he has been silently crouching like a statue of Buddha, and brings me, to light my cigar, a long match of which he has the constant care. It is made of sandal-wood saw-dust glued together, and burns night and day with the most delicious perfume. I feel as if I were turning into a pacha!

As regards the dinner itself, as a North-man I must make some reservation: eight-and-forty different kinds of capsciums, a mountain of rice covering a microscopic atom of chicken (the antitype of the fragment of the Australian *Dinornis*), which, with a Cayenne-pepper sauce, constitutes the celebrated curry; an absence of all meat that can be cut with an ordinary knife; an abundance of bamboo salads and chutnee—there is a local flavor about this much appreciated by amateurs, but which, in palates and digestions unaccustomed to Javanese cooking, raises fiery torments, which are only increased by drinking.

11th November.—As I lay down last night on a bed already possessing the peculiarity of being made with mats instead of sheets, I was greatly surprised to find, besides the innumerable gnats imprisoned behind the mosquito-net, a companion quite as remarkable. This was a long roll made of grass matting, about two yards long, and the thickness of an ordinary bolster, which awaited me, laid lengthwise on the bed. It was obligingly explained to me that no inhabitant of Java will sleep without this vegetable production, which must be kept between the legs to cool the body. I was very much amused with this specimen of manners and customs; but, if it soothes

* A narrow sash tied round the loins.

the creoles with a refreshing slumber, it rouses Europeans uncontrollably to a bolstering match. Besides, the swarms of buzzing mosquitoes, with their impertinent stings, exasperated us by whistling their Javanese airs in our ears; but as the capscums, the grass bolsters, and the mosquitoes, are necessary features of the locality, I intend in a few days to make friends with them all.

Very different from Paris customs, fashionable life begins here at half-past four in the morning. As soon as the first mists of a tropical dawn appear, old and young begin to be heard moving over the tiled floors, in slippers, and, wrapped in floating cotton garments, hasten to the pools to enjoy the ice-cold waves. As I left them, I met a real odalisk, with jet-black eyes, and of the most foreign appearance; she glided between the columns, throwing back masses of black hair which fell to the ground, and classically draped, like Stratonice, in rose-colored cashmere. She seemed to us really an apparition, with her sudden changing glances, the wild swiftness of her movements, her air as of a lioness surprised, and that Indian fire in her veins which always gives so fascinating a charm. We were told that she was the daughter of a Dutch officer and of a native of Borneo.

The half-caste beauties bloom wonderfully under the sun of Java, while the unhappy Europeans, enfeebled and worn out by the heat, look pale and ghastly, and inspire one with the most profound pity. Such was my first impression, while taking my walk between four and six in the morning, the especially fashionable hour. But what particularly struck me was a military post: twenty Malays were on guard, armed with pikes and pitchforks more than nine feet long. It was explained to us that in this country there are a good many natives suffering from mental disease; over-excited by opium, they wander over the island armed with a sword, and run through the body the first man they fall in with, in honor of the Koran. This is called running a muck. As soon as one of these men appears, the guard gives chase, encloses him between three pitchforks, and the corporal, whose rank may be easily recognized from the fact of his wearing shoes, has the honor of running through with a javelin the terrible madman. First insight into the internal government.

A morning at Batavia consists of a walk, five or six baths running, and an appetizing breakfast. In the afternoon every one sleeps.

Toward six o'clock in the evening a little stir begins to be felt: hundreds of open carriages drive about. The European population, lounging bare-headed, wends its way to the Waterloo plain, where a military band is playing. We follow the stream, still delighted by the enchanting avenues and brilliant dresses. This "Longchamps" partakes completely of the character of the colony; the garrison, nine thousand men strong, is its principal ornament; more than three hundred carriages stand in the shade of the great trees; the national airs, very well played, echo loudly; and officers gallop about among the myriads of Javanese in holiday dress, glittering in the most brilliant Eastern finery. Imagine a tall, fine-looking man, in a blue tunic, loose white trousers, high boots, large spurs, and big sword; suppose that he will kindly open his legs to admit between them a superbly caparisoned pony, about the size of a Newfoundland dog, and you have a truthful picture of the Javanese representatives of the armed force of all the Netherlands. The small size of the horse detracts in no wise from the greatest military virtues, and Heaven knows that the fame of this army is beyond all praise; but when a troop of Liliputian horses, mounted by worthy companions of Gulliver, charge the enemy, it is impossible to help laughing with all one's heart.

We dined this evening with our friend M. Van Delden, the president of the Chamber of Commerce. Our agreeable companion in the stifling cabin of the "Hero" had resumed his princely existence in his palace, amid the peaceful charms of his delightful family circle. Luxurious pools, gardens of Armida, a veranda dining-room amid the luxuriant foliage of blooming thickets, swarms of Indian servants in their most splendid national dress, nothing is wanting of all that can be imagined as the regal reward of industry, probity, and talent. How is it possible, after the well-earned delights of such a paradise, to return to a muddy, foggy street in Holland, and live there without twenty horses or fourscore servants? Holland is but a name to be passionately loved by these patriotic hearts; from time to time they return to see it, and to reinvigorate themselves on their native soil; but space, wealth, sunshine, authority, are wanting there to the happy in-

habitants of Java, whom monopoly has here made pachas and kings, and who feel little inclined to become subjects, rate-payers, and tenants on lease again, at home!

12th November.—We follow the fashion and take an airing, at five o'clock in the morning, on M. Van Delden's skittish ponies. Still the same bowers, the same marvels of verdure and bloom, of perfume and foliage; still the same number of villas scattered about in gardens, the same movement on a hundred different canals, the same brilliant colors in this human ant-hill, which moves busily about screaming noisily like a flight of cockatoos. At nine o'clock we have already reached our fifth bath. This torrid temperature of one hundred and four degrees in the shade would really, I believe, burst any thermometer that was put into the sun. I braved it nevertheless with a pyramidal white cotton helmet on my head, which made me look like a whitewashed fireman. I was much puzzled with the narrow winding lanes of the old town, where the inhabitants pack themselves into their bamboo huts as we should pile up sacks of wheat in a corn-market. The Malay shops are filled with calico goods and sticky eatables; the Chinese shops are of a superior kind. Here, for example, is the stall of a Chinese watchmaker. The proprietor's plaited tail is the sole garment which appears on his immensely fat body. He holds a magnifying glass in his left eye by a contraction of the eye brow, which contorts his features into a horrible grimace, and this semi-nude jeweller is audaciously handling a Breguet watch, and seems very proud of being able to take the Paris workmanship so cleverly to pieces. His neighbor sell monkeys, his opposite neighbor innumerable preparations of capscums in innumerable saucers piled one upon another. Everywhere a putrid and disgusting smell reigns. The sea-breeze brings great whiffs of it, exhaled from the mangrove-trees and poisonous shrubs which cover the shore. The advancing tide swells their knotted, twisted, porous roots; in a few hours they increase some inches in diameter; then the ebb leaves them exposed on the unhealthy mud; the sun pours down, evaporates and dries them up; a line of yellowish clouds, of pestilential mist, forms itself, and remains for a moment suspended, waiting to be carried off by the wind, and then, woe to the coast where the caprice of the atmosphere may direct it!

It is these deadly miasms, which have given to the old town of Batavia that general reputation for unhealthiness, which made you fear for us when we left home. And, in fact, it is impossible to count the numbers who have fallen victims there since the occupation of the place. I was speaking of this subject with an agreeable acquaintance. "Oh!" said he, "before the period when we retreated from the shores to found the new town, people died like flies in old Batavia; it was actual poisoning for every human being; but now, what does it signify? no one lives there but Chinese or Malays!" This saying, any thing but philanthropic, recalled to my mind a certain correspondence in the last Mexican War. Having enumerated the disasters from yellow fever on the coast, and given an account of the movement of the troops into the interior, the letter said: "But families may feel reassured now, there are none but sailors on the coast!" The families of the French sailors must have been about as much comforted as those of the natives are here. Notwithstanding the pure air of the new town, we have just had a terrible example of the consequence of imprudence. One of our neighbors at table, who had eaten too freely of the juicy pine-apples at dessert yesterday evening, looked a little pale at the mid-day breakfast—at three o'clock, he was dead! It is the only thing which is done quickly in these tropical latitudes!

Hardly is the hour of our *siesta* over before we sit down to write under our veranda. Immediately we are besieged by some fifty Chinese or Malays, wanting to sell us neck-ties or handkerchiefs, French photographs and military sketches. I drive them away, they return; I threaten them, they spread out a hundred new things, this one crying up his trousers, another his eau-de-Cologne, a third his monkeys. Determined to wait the end of my letter, they are at this moment crouching down in the full sun ten paces from us, evidently hoping that I shall be in a more conciliatory disposition presently. In the evening we were roused by a fire. A hundred and eighty houses—reed huts—in the old town were blazing like a lot of lucifer matches. What quantities of vermin must have been roasted!

13th November.—We might have expected this! The captain of the "Hero," our neighbor in this corridor, turned pale yesterday

evening, and passed the night prostrate on the ground very sick, and groaning. We ourselves have paid the necessary tribute of new arrivals, and our interiors are in a pitiable state. If we can preserve our cheerfulness, we are safe from that phantom of cholera—and Javanese cholera—which takes fright if it does not inspire it.

Here, too, is something to restore us—the pure air of the mountains inland. A charming letter from the governor-general for the time being informs us that, “political considerations not permitting him to offer to a prince in exile the honors due to a French prince, he yet begs to be allowed to treat him as the grandson of a king.” He sends us a circular passport, a most rare and valuable favor, for the whole island, and even for the so-called imperial territories, where under Dutch protection the Sultans of Sourakarta and Djokjakarta reign; notice is given to all the residents and native princes in the island, and the government post-horses are put at the prince’s service gratuitously. This is a piece of good fortune which delights us and fills us with the most lively gratitude.

Change being recommended for those who feel the enervating effect of this fiery climate, we have not refused the kind invitation of the resident of Batavia, M. Hoozeveen. At six o’clock in the evening his state-carriage came to fetch us. Four outrunners, all dressed in white, carry long white horses’ tails with which they flick away the flies from our team; they make good use of their legs, each running by the side of his pony and effectually chasing the flies. We gallop and they run, such is the custom here. In half an hour we arrive at the palace. A regiment of servants are on the steps, turbans, sashes, arms; all the splendid figures of Oriental scenery stand out brilliantly on the marble. The resident receives the prince most cordially; then come the general in command, the colonels of artillery, the civil engineers, and finally the sultan and sultana of one of the principalities of Borneo. The husband is a stunted little old man, wrinkled and rheumatic, furiously chewing a paste made of lime and betel-nut, which blackens the teeth and makes the gums bleed, and which, stuck between the teeth and the lower lip, swells the latter, by nature hanging, and so increases a hideous and deformed swelling.

But the sultana is charming. She is a little person, young, and with bright eyes, and returns the greeting of the young Europeans with perfect grace. Her dress consists of a mantle of blue-and-yellow silk. A red-and-white scarf, passed across her shoulder, covers her bosom, and is kept in its place by a brooch of twelve intertwined crescents made of diamonds of the island. It is the prettiest jewel I ever saw. A red turban, with a diamond ornament at the side, frames the smiling expressive bronze head.

As for us, while sauntering among the white arcades, among strange groups of soldiers, servants, incense-burners, and cigar-lighters, we had the pleasure of arranging a crocodile-hunt with the good-natured resident.

14th November.—Beyond the repeated *siestas*, which are the great secret of happiness when one is so near the line; beyond the lounging and bathing, and the delicious cups of coffee, every thing is a labor under this sun! All the same, I have closed my mail-bag for Europe and paid the postage on it; no mere form of politeness, I assure you. Seven-and-twenty shillings for postage have I paid this morning.

I had almost forgotten our visit to the museum, of which the resident did the honors to the prince. Besides the fly-flapping outrunners, M. Hoozeveen is accompanied by the gilt-umbrella-bearing outrunner, and two cigar-lighters, who trot behind us brandishing the sandal-wood match, that vestal fire always kept up for the official “manillas.” The museum is magnificent, and so curious as to be quite unintelligible to the traveller who is not well versed in Sanscrit, Javanese, Sunda, Bali, and Hindoo divinities, with their big stomachs, slits of eyes, and humped backs, double faces, and half a dozen arms and legs kicking about; silver chickens with five legs; ancient lamps and tom-toms, with which we produced the most astonishing noises—and I know not what besides. It is a perfect nightmare.

MY BUSINESS FRIENDS.—MR. BULBARE.

AT a short distance from my country-home Mr. Bulbare has a villa. He is a broker, and his dealings are in gold and stocks. The plot of ground, containing five or six acres, was bought “on

speculation” by Mr. Bulbare, several years ago, and the first instalment of the purchase-money paid on the spot. He has since told me that the plot had been “hypothecated” forty times before he decided to build the highly-ornamental villa he now inhabits, and I shall give the story in his own words first, and then offer a translation into ordinary English. It required much patience and laborious research to get the narrative into the vernacular, and I accomplished it by persevering effort, during the daily railway journey to the city, last spring.

“You see, Jones”—this was the technical story—“I had hypothecated that plot till I was sick of it. Mrs. Bulbare looked at it, and said, if I built a decent house on it, she would live in it. So I went to work. I went long an even hundred at sixty-one. I shall never forget the figgers. The metal went up and down, but I just let it set. I put the figger at ninety-four and waited eleven months. Sold out at ninety-four and three-eighths, bagged thirty clean, paid off all encumbrances on the plot, and built the viller. There she stands, and not a scratch against it! It belongs to Mrs. Bulbare.”

The translation is superfluous to gentlemen who are familiar with gold-room lingo; to me it has been like the first studies in a new language, enabling me to gather the meaning from occult discourses on the same topic. “Going long an even hundred at sixty-one,” meant purchasing a hundred thousand dollars in gold, at a premium of sixty-one per centum. So “bagging thirty clean,” meant securing a profit of thirty thousand dollars in the operation. My curiosity was excited by Mr. Bulbare’s discourse, and I eagerly accepted his invitation to spend an hour at the Gold Exchange, and witness the operations of his board.

At the time appointed I went down to his office, and, after some formalities, I was admitted to the room where the “operators” were at work. I have been present at large political gatherings—I attended a camp-meeting once—I have heard the roar of a tornado in a tropical forest; but the noise in the gold-room exceeded all my former experience. It was the combined growl of a hundred bears, mingled with the furious howlings of a hundred bulls. It was one prolonged shout, and, for half an hour, I vainly strove to catch a separate sentence that would indicate what the madmen were after. It seemed that everybody wished to buy fabulous sums, which everybody was ready to sell. I do not believe that there is as much coined gold in the world as was bid for and offered while I sat in that bedlam. One lanky gentleman, with a distressed countenance, attracted my attention particularly. He was so terribly in earnest, and so terribly greedy. “I’ll give an eighth for any part of a million!” he shouted. “I’ll give an eighth for fifty! I’ll give an eighth for a hundred!” There is a fountain in the centre of the room, protected by a circular iron-railing, probably eight or ten feet in diameter, and over this rail, and through the beautiful spray of the fountain, these eager men were tossing their bids and offers. Each man frantically challenged all the rest to sell or buy enough gold to pay all the public debts of all nationalities three or four times over, and nothing prevented the instant completion of the contract, but one-eighth of one per centum. The lank man was on the verge of insanity in his anxiety to buy a million at “an eighth.” A fat German near him stolidly reiterated his desire to sell the same amount at “a quarter.” I counted once, and he offered that million at “a quarter” sixty-nine times without a pause. The lank man with rueful visage was far more rapid in his utterances, and I suppose he “bid” for the same million six hundred and ninety times, in the same number of seconds.

I knew a young villain of a school-boy some years ago, who had a horror of “declamation,” which came round regularly every Friday. Once he had to “speak a piece.” I think it was “My voice is still for war-gods! Can a Roman senate long debate!” I spent an evening at his father’s house, and the old gentleman, being vain of the whelp’s powers, insisted upon the delivery of the speech, for the entertainment of his guests. The boy stood up like a statue and repeated the horrid speech without moving a muscle, and then observed: “Ladies and gentlemen, I can’t possibly remember all the words and all the gestures at the same time; I will now give the appropriate gestures, and you can put them in to suit yourselves!” Whereupon he threw and twisted his body into forty inimitable and indescribable contortions, which nearly fractured all my bones from mere sympathy. When I saw the gold-men throwing their “unwholesome corpses” into strange attitudes around that railing, I concluded that my young friend had been exorcised, and his legion had migrated to the gold-room. If the various operators could be suddenly frozen in the midst of their

violent gesticulations, their photographs would make capital illustrations for Dante's "Inferno." I was still watching the struggle, and endeavoring to translate the uproar, when Bulbare plucked me by the sleeve.

"Come, old hoss!" he said, "I've just made a turn. Sold twenty at a quarter, and bought it in at a naith. Twenty-five dollars clean. Let's go to lunch!"

He took me to Delmonico's, where, at a wink from Bulbare, we were ushered into a private room. There was a blazing fire of cannon coal in the grate, and the room looked luxurious. Bulbare rapidly gave his orders as we drew off our overcoats.

"Green turtle for one, filly for one, with champignons, and a Roderer. Give us some French bread, John, pan fransay, you know."

He fairly divided the soup, and afterward the "filly," which proved to be a tenderloin-steak, of remarkable succulence. He did *not* divide the wine, but gave me one glass at my own request, while he "got outside" of the remainder. It was while we were sipping the last of it, that he gave me the curious explanations that follow. I had led the way to the revelation by a system of direct questions, induced by my recent gold-room experience. It is probable that the Roderer lubricated the root of Bulbare's tongue, as he was far more communicative toward the end of the feast than he was at the beginning.

"You want to know how ush fellers make any money? Easy! a naith or ten is twelve dollars, free of stamps. Just as easy to turn fifty as ten."

"But suppose the turn is the wrong way? If you make an eighth, some other broker must lose the same sum."

"Exactly! Well, if I lose on a turn, I have to make two more turns; one to get even, and the other to make expenses."

"Suppose you are mistaken every time," I persisted, "and all the turns are against you?"

Bulbare reflected a few minutes. He was apparently trying to estimate the depth of my stupidity. There was gravity in his countenance, his intonations were deliberate, his words carefully selected. The Roderer glistened and twinkled in his eyeballs, but he steadily advanced to a moral eminence as our discourse proceeded:

"You see, Jonesh," he said, condescendingly, "it is difficult for you to understand this here business, unless you was 'quainted with the market. Most of them fellers that was bullin to-day, was operatin' for one man. S'pose we say it was Peeper? Well, Peeper is certainly in the bear clique. He wants to run the market up a point, and then put out a lot short."

"Pray, how do you know?"

"In the first place, Peeper hasn't been in the gold-room to-day. That's a sure sign that somethin's up. Nextly, the fellers that was the craziest to op'rate, seemed to go in for his attorney all the time. But Peeper's man was operatin' in fives and tens, and the other fellers in hundreds. That looked s'picious. Nextly, every time the market moved a naith, all them fellers pretended they wanted to unload, but they didn't. Why I bought my twenty to-day from Peeper's own attorney, which I had sold to one of them bullin fellers half an hour earlier."

I was hopelessly muddled by this time. There was so much clairvoyance about the business, that it elevated my interlocutor to the clouds, leaving me groping in the dark.

"You don't understand?" resumed Mr. Bulbare, noticing my puzzled look. "Don't you see that Peeper will have to pay me that twenty-fives, s'posin I am right in my s'picious? Very well! Now if I had *lost* on that turn, it's quite likely that them fellers would have divided, and Peeper would never have heard of that turn."

This was encouraging. I began to see how it was possible to make a little money without any great risk. The morality looked rather shady, however, and my friend appeared to see that some such thought was in my mind.

"You s'ce, Jonesh," continued my friend, with slightly-thickened utterance, "there's fellers there that don't have any reg'lar bishness, that is, they don't have a reg'lar lot of cushtomers. Now I have about a dozen spee'latters, you know. Some of 'em are bullin and some bearin. They give me loose kind of orders to watch the market, and op'rate whenever I think it is safe. So I am buying and selling every day. When the board closes, I jist add up my book, and divide results among 'em. I git a naith commission, and my book is open to inspection. Noth'n' could be fairer. Everybody *can't* win every time."

"It seems to me that *you* win every time, Bulbare. You are always sure of your commission."

"Not always," answered Bulbare, as he struggled into his overcoat, "fellers is bustin' on me every now and then. When that happens I lose commissions and balances both. It's a very precarious bishness for brokers. S'pose I make a noperation for *you*?"

I declined this kind offer politely, but decidedly. Bulbare's method of "balancing his books" looks alarming, and I cannot decide whether his clients are better off when they are "long" or when they are "short." There are quieter localities up-town, where a gentleman can dispose of his superfluous cash, "five, ten, or twenty" at a time, in the same number of minutes, and I believe there are no commissions over the green-table. Besides, one can calculate with more certainty upon the turn of a painted pasteboard than he can upon the wiles of Mr. Bulbare.

A. JONES.

THE TORMENTS OF TYPOGRAPHY.

A CAUSE recently tried in the Supreme Court of New Hampshire brought to a legal test the popular proverb that "printers can read any thing," and forcibly illustrated the cruelty of authors who inflict their staircase wit upon the long-suffering compositor.

An eminent lawyer, who had been on the bench, prepared a digest of the New-Hampshire Reports, for the printing of which he made a contract with a firm acknowledged to be the best typographers in the State, who agreed to do the work for so much a printed page. It was distinctly specified that the copy must be very good, as the abundance of proper names, technical terms, abbreviations, figures, etc., would make it impossible for the compositor to produce fair proof unless the copy were distinct and legible in every separate word. It was even stipulated that the manuscript must *not* be in the author's hand, as these printers had had experience with it, and knew it to be unusually bad. It was also told him, in a letter which was produced in evidence on the trial, that any alterations he should make, after the type was set, would be very costly. The copy presented for the first sixteen pages was in a clerk's hand, and was pronounced satisfactory, and the work of composition was begun. After that, the copy furnished was partly in the author's own hand, partly in the clerk's, partly printed and partly written, pasted together in irregular shapes, interlined, and edge-written. The printers made complaint to the author, but kept their compositors at work on whatever copy was furnished. It was in evidence that the compositors had spent much time in consultations as to the probable signification of illegible passages, and had even, in a few cases, been obliged to leave the office and seek out a lawyer to read their copy to them. When the proofs were returned, they had been freely marked at variance with the copy. New matter was added in many places, old matter marked out, and all sorts of emendations required. An account was kept of the time spent in correcting these proofs, and a charge was made for it at the usual rate, fifty cents an hour. A charge was also made for the time spent in deciphering illegible copy. These charges, which amounted to several hundred dollars, the author refused to pay. Hence the suit. He refused also to pay full rates for the pages that had but little matter on them, or to pay any thing for the blank page backing the title-page. A large mass of the copy was brought in as evidence, and submitted to the inspection of judge and jury. The plaintiffs offered to bring in a page of the matter in type, with the marked proof, and have a compositor go through the process of correcting it before the jury, that they might understand the actual labor often involved in the insertion of a single new word after the type is set. But the court ruled it out, as unnecessary. The main reliance of the plaintiffs was upon usage and equity. The plea of the defence was that, if the copy offered was not such as the contract specified, the remedy of the plaintiffs was in refusing to accept it; that, by accepting it and working from it, they admitted its fairness. The jury gave a verdict for the plaintiffs, allowing the propriety of all the charges in the bill, but reducing the amounts charged for deciphering copy and correcting author's proofs.

The torments of typography are more numerous, and more exquisitely and persistently torturing, than any one not intimately acquainted with a printing-office can imagine. Seldom is a piece of manuscript seen, unless prepared by a working-editor, which is absolutely fit to be put into a compositor's hands, with instructions to follow copy

What is unexceptionable as a letter, as a sermon, or as a lawyer's brief, may be unfit for the compositor, until the editor or proof-reader has defaced it with numerous pencil-marks. And this is true throughout the whole range of productions offered for print, from those of chance writers in the provincial press, up to those of our best-known authors. Of the latter, the most perfect I have ever seen is Bayard Taylor's. But Mr. Taylor was a practical printer in early life.

The best copy is not always made by those who would be considered the best penmen. Our writing-schools and commercial colleges do a deal of mischief in this respect. The main object of manuscript is to be read. If it cannot be read, it is worthless; if liable to be misread, it is worse than worthless, though its flourishes be as fine and faultless as a bank-note engraver could produce. It is true that the professors of penmanship aim at a degree of perfection which shall combine elegance and legibility. But the majority of their pupils never attain that point. They generally stop short at a stage where their manuscript, if held at arm's-length, looks very graceful, even, and handsome; but when you bring it nearer the eye, and attempt to read it, you find that half a dozen different letters of the alphabet are represented by precisely the same sort of kink in the undulating lines that cross the page. It matters little how ungraceful or clumsy one's chirography may be; if he uniformly makes a distinct character for each letter of the alphabet, it can soon be read with ease. But there is a good deal of writing, called elegant, in which such words as "moreover" and "carnivorous"—words with no long letters in them—are represented by a mark like the outline of a row of saw-teeth. You can only guess them from the context, and can only guess the context from its long letters. When it treats of ordinary topics, such manuscript can be used, though it is always an annoyance. But when proper names and technical terms are written in this way, it becomes exasperating beyond all endurance. A somewhat noted man of science used to contribute periodically to the local paper, generally discussing the meteorological phenomena—ordinary and extraordinary—of the month. He used a very blunt pen, and most of his words resembled what the ladies call "tape-trimming." In attempting to dot an *i*, he generally hit the wrong head, and all the *t*'s bore their crosses vicariously. As compositors generally are not practical electricians, do not give their days and nights to the study of astronomy, and know comparatively little of geology or other ologies, the unsanctified mind will readily conceive that a plentiful amount of profanity preceded the clicking of every line of type. But the good old man, as he serenely glanced over his contribution in the morning paper, little dreamed with what agonies it had been born into the world of print.

Compositors have their own characteristic blunders—both those peculiar to the guild, and those peculiar to the individual. A proof-reader, after a while, comes to know them, and to anticipate certain errors. One of the most general is a tendency to exaggerate figures. Write one million in numerals, and the compositor is pretty sure to make it ten million. For some compositors, copy can be too plain. Receiving a piece that is clear as print, they at once become so confident of reading it with ease and correctness, that they make frequent misreadings. They do best with manuscript that requires a little study. Some never can get over a passage in which the same word occurs in two consecutive lines, without skipping all between the word and its repetition; some have so keen a sense of literal justice, that they always give "preceding a double *e*, because "proceeding" has one; and some look contemptuously upon the distinction between the possessive singular and the possessive plural as an unworthy quibble or collegians.

But, of all typographical torments endured by the daily press, none are comparable with those inflicted by the telegraph. Nothing need be said of the vast mass of trash sent over the wires every twenty-four hours, not half of which would be read—if, indeed, it would be printed—were it not for the magical words "By telegraph." The agents of the various press associations must answer for this. The telegraph would be blameless if it would only deliver faithfully and accurately at one end whatever is put upon it at the other. The *Journal of the Telegraph* prints the following message, which, it says, was recently sent over the line, and gravely discusses the question whether the operator was justified in sending it *verbatim*:

"Hiert A Bay Hors ffitin hans by Short Main and Tail Blind in Lef Eye letter C. S. on left sholder Hiert to a man by the naim of Stevens on monday to be Returnt on Tuesday no Returnt yet. ceep a Luk out for Hym and dhespatch to Greencastle and Shampersbug to sum cood man and I will pay you for it."

If the operator sent that message exactly as it is written, it was perfectly intelligible, though nearly every word is misspelled. But, when plain English travels by the lightning-team, it often arrives at its destination looking as if the lightning had struck it on the way. If the poor gamin's message was delivered just as he wrote it, the telegraph served him better than it is wont to serve the President of the United States. I read a recent message of the President in one of the most respectable and widely circulated of the Boston dailies. Its typographical appearance showed that the proof had been read with unusual care. Yet I discovered thirty-two errors that affected the sense, and perhaps might have found more with an authentic copy before me.

The cause of this trouble is twofold. First, there is a difficulty inseparable from the sound-system. The receiving operator can never tell what is coming; he must generally begin a sentence with little idea as to what is to be its close. Hence a very slight misconception or variation of sound may lead him astray, and cause him to change the whole import of the sentence in hand. Second, operators are mostly men of too limited education. They go into the offices as message-boys when very young, learn to operate, and gradually work up to responsible positions without ever receiving any more schooling. This fact betrays itself continually in the press reports as they come from the telegraph-office. Geographical and historical names and allusions are almost invariably wrong, and an argumentative paragraph is sure to be muddled by having its periods put in the wrong places. Some telegraphic errors are so pertinacious as to suggest a sort of galvanic stereotype. The Prince of Asturias, when he travels over the wires, always goes, *incognito*, as the "Prince of Austria." If Congress takes a vote by tellers, the press is informed that it was taken by "letters." And, whenever the wires are up, the boundary between Colombia and Columbia is sure to be down. You can no more induce a telegraph operator to forego his indulgence in these and kindred blunders, than you can coax, cajole, train, frighten, drive, or hire, a provincial compositor to spell tranquillity with a double *l*.

ROSSITER JOHNSON.

SABOTS.

SOME years ago, while travelling through Northern France, and stopping overnight at the *auberge* of a small market-town in the Department of Côtes-du-Nord, I was awakened early in the morning from a sound sleep, after a whole day's tiresome travelling through straight and dusty *chaussées* of poplar—nothing but poplar—by a sound on the sidewalk below my window, unlike any thing that I had ever heard before. It was "clap-tap-tap," at regular intervals and in quick succession—"clap-tap-clap-rap-e-trap-rap," etc., etc., sometimes right beneath the window; then a little farther off, coming or going; and then, again, it seemed to come from the middle of the street. In vain did I speculate—lying in the bed, half awake—what all this noise, so early in the morning, could possibly be. But soon, being fully awake, and going to the window, I at once observed the cause of the uncouth noise that had so rudely broken off my morning's nap. There, below, was a long file of sturdy-looking and stout peasant-women, all with huge baskets on their heads, tramping and clattering up the street in the direction of the market-place outside the old church that I had passed the evening before. One after another, sometimes two or more going abreast, they passed rapidly by, every time they put down the foot being accompanied by a loud "clap-tap" on the hard pavement. Some men, with coarse, sun-burned features, long hair, and broad-brimmed hats, there were among them, but not many; they were mostly women and half-grown girls, the latter, however, dressed exactly like their elders, and carrying baskets equally large and well filled with fruits, potatoes, and vegetables of all kinds. Never before had I supposed that women could make such a distracting noise, and I stood lost in wonder over what on earth they could have on their feet that could make such a clatter. This I was not long in discovering; for their short skirts revealed at every step a piece of blue or red stocking, ending in a huge wooden shoe, turned up at the nose and almost as broad as long, which would, I estimated, weigh in the neighborhood of four or five pounds a piece. No wonder those wooden hammers could make a noise almost sufficient to wake the dead in the little church-yard they passed by on the hard flagging, and banish sleep from the eyes of any unfortunate and weary traveller that chanced to be within a mile of their performance.

These *sabots*, as they are called, however, awoke my interest. "I wonder who makes them, how much they cost, and how long they will last?" I thought; for, though I had travelled extensively through the Departments of Côtes-du-Nord, Loire-Inférieure, and Finistère, and frequently seen this kind of shoe worn in the country-places and exhibited for sale at the markets or country-fairs, I had never yet come across any one that seemed to be engaged in their manufacture. The peasants did not make their own *sabots*, but bought them ready made at the numerous booths and stalls where they on market-days were exhibited for sale, tied together with bands made of straw, as huge "ropes of pearls" on a yellow ribbon. Where did they come from? Who was engaged in their manufacture? I asked everybody I came across for this information. But all that I could gather from what seemed to be the best-informed sources was that nearly all *sabots* were imported from *du Nord* by large wholesale dealers in Rennes, Nantes, and Vannes. With that information I had to be contented, for I did not desire to go to these cities—one of which I had already visited, and the others were out of my way and programme—merely to satisfy my curiosity upon that point by "interviewing" the wholesale dealers in this commodity.

A little more than a year after, accident brought me to the kingdom of Denmark, and, after having transacted some business at Copenhagen, I went to the province of Jutland, forming the peninsula that juts out between the Baltic, the Little Belt, and the Cattegat on one side, and the North Sea on the other. In the centre of this country, I suddenly and unexpectedly came upon the makers of the *sabots* that I had seen worn in France, and there I found myself in the very heart of headquarters for the manufacture and production of this certainly very useful, if not ornamental, article.

For there, on both sides of the little river Gudenaa, dwell a people, honest, industrious, and exceedingly hospitable, as I found by practical experience, whose main pursuit and source of income is the making of wooden *sabots*, that are from there distributed over nearly all those parts of the world where this peculiar kind of "shoe" is worn. I shall never forget the hospitable habits, the cordial manners toward an entire stranger, and the quiet peace and happiness, that reigned among those people. The district that they occupy is formed by the centre of the ridge or rib that traverses Jutland from south to north, where it ends in the Skagen. To the east, the Gudenaa flows quietly, almost without a ripple, toward the beautiful inland lakes of Juel-Sø and Moss-Sø; to the northeast rises the Himmelbjerget, the highest point in Denmark; to the north and south, rich fields of golden rye and barley, interspersed with pinkish-green patches of clover and white streaks of buckwheat, greet the eye; and toward the west the vista loses itself in the distance, where the clear blue sky seems to melt together with the undulating, dark-brown expanse of heather. Fata morgana are here of daily occurrence; looking steadily toward the west on a hot summer's day, you can see the air tremble and flicker, and presently some strange vision will appear before your eyes. Sometimes it is houses and churches, with domes and steeples; sometimes it looks like enormous mountains, with picturesque vales and grottos, and ragged, weather-beaten peaks and points; and sometimes, again, you could almost swear that you see a ship going full sail through the air, but, curiously enough, upside down. At other times I have seen the whole heather-grown expanse look, at a little distance, as one vast sea; but, if you tried to wade into it, the water would apparently recede, and you could never approach one step nearer to this fairy-lake.

Amid all this scenic poetry and beauty are the *sabots* manufactured. There are no great factories, no black smoke, no machinery, and no gangs of "hands," to be seen there; each "manufacturer" dwells in his own little cottage, clean and tidy inside, though it looks but humble with its walls of dried clay and roof of the dark-blooming heather. No "hands" are ever employed, save those of the maker himself and his family. The shoes are carved out of square wooden blocks of green maple or beech wood, which are first roughly formed with a hatchet into a shape having a remote resemblance to the human foot, and afterward finished off with a rasp and file, and some times sand-paper. When finished, these shoes are left to soak for about a week in one of the innumerable bog-holes filled with water that abound in the vicinity, which treatment improves their toughness and quality, and darkens the color. After that they are dried in the open air, and finally tied together in pairs, which are again strung and bundled together in dozens, or sometimes tens or

twenties. When the manufacturer has finished a sufficient number of pairs, he sends them to the neighboring ports of Aarhus, Aalborg, or Horsens, where they are shipped in small sloops—the whole cargo of which often consists of nothing but *sabots*—to Copenhagen, or sometimes direct to Lübeck or Hamburg, *via* Kiel. Here commercial travellers from Brétagne and Northern France buy them for the supply of their markets; and often these travellers or dealers go themselves to the direct source, and purchase from or contract for a quantity with the makers themselves. With but few exceptions, every wooden shoe worn in Brétagne, every *sabot* in France, is made many hundred miles to the north, on the banks of the quiet little river Gudenaa in Denmark; and few articles for human use have their origin amid less care and trouble, and among more contentment and happiness, than have the clumsy and uncouth, though lasting and weather-proof, *sabots*.

LOUIS BAGGER.

EAST HAMPTON AND ITS OLD CHURCH.

WITH ILLUSTRATIONS BY HARRY FENN.

THERE is no part of Long Island, and but few sections of our country, which have so much historic and romantic interest as the eastern end of that island, the beautiful Peconic Bay, and the wild, surf-beaten peninsula of Montauk. Here were very early settlements, and here the last remnants of the great tribe of Montauks still maintain a fading existence. Here are stormy ocean shores in all their grandeur, and here too are placid bays and tranquil nooks, where the most solitude-loving yachtsman might anchor without fear of annoyance. Go on shore, and we find a people almost primitive in their ideas, descendants of bold, hardy pioneers, who, more than two hundred years ago, here planted their feet and proclaimed their right to worship God as their consciences dictated. But little have they changed since then. Most especially is this true of the southern side of Peconic Bay, the seat of the ancient Hampton villages, the abode of men who not only easily trace back their lineage for centuries, but live in houses whose timber left its parent earth one hundred and fifty years ago.

This region, like all the rest of Long Island, is exceedingly interesting to the geologist. It is a strange mass of drift, and presents also the singular anomaly of good fertile soil at both ends, while in the middle is a mass of almost worthless sand-hills. The traveller on the Long Island Railroad will be struck with this fact. One of the historians of the island theorizes that it was once joined at both ends to the main-land, or perhaps only at one, and that the mass of middle sands were thrown or washed up. However, whether it be to see the soil, to rest from the weary cares of business, to enjoy ocean-air and ocean-bathing in perfection, or to dwell amid scenes and things that carry one back far beyond the "time that tried men's souls," eastern Long Island is well worth a visit.

Of all the original places in that old-style land, and of all the places that date back into the seventeenth century, none so now retain the customs and relics of the past in their perfectness as East Hampton. Here, within one hundred miles of New-York City, is a place as dissimilar as if the great city were not; and within the quiet limits of this village, but for the telegraph-wires, one might easily imagine himself in a good old Puritan village of the last century.

Two hundred and twenty-one years ago, in October, the earliest recorded date, a band of hardy Puritans landed on the shores of Peconic Bay, and, passing southward to near the ocean, founded the present town of East Hampton. Nine years previous a similar band had founded South Hampton. Some came from Massachusetts, but the greater number direct from Kent, England. They named the town Maidstone, from the place most of them dwelt in in England, and why the name was changed, only a few years after, does not appear on any record. They paid for the land thirty-eight pounds four shillings and eight pence, and the Indians were also to have the "fynns and tails of all the whales as shall be cast upp; allsoe if the Indyans, hunting of any deare, they should chase them into the water, and the English should kill them, the English shall have the body, and the Sachem the skin." The deed is signed by Richard Woodhull, Thomas Stanton, Robert Bond, Job Sayre, for the colonists, and Poggatacut, Wyandaneh, Momoweta, and Nowedonah, for the Indians; Chectanoo acted as interpreter.

There were thirty-three of the original settlers, but some changes soon occurred. They laid out a long, straight street, about three hundred feet wide, and built their houses on each side of it. Each house had a lot adjoining of from eight to twelve acres. The mill and church were located at the south end of the street; the latter in the grounds laid out as a graveyard. These people could not live without a preacher and a church, even if they were of that clan who founded

"A church without a bishop,
A state without a king."

So the first house built was used for church-meetings, and the owner was paid a shilling and six pence for each sabbath it was so used. As soon as possible they built a house for church purposes solely. It was finished in 1652, was twenty by twenty-six feet in size, with a thatch roof. This building was enlarged in 1673, and again in 1693. In 1717 it was rebuilt, nearer the middle of the town. A great many of the timbers of the old church were used in the new, and doubtless many of the beams were hewn out of the native trees over two hundred and twenty years ago. That vane, which one hundred and fifty years ago told the villagers of a favorable wind or an eastern storm, still tells the same tale with unerring faithfulness. But there is no end to human cupidity; and even in ancient East Hampton, with all the associations by genealogy and tradition with the far-distant past, this venerable relic of men and days long gone by has been sold under the hammer, and is to be torn down to gratify petty avarice and greed.

Previous to the remodelling in 1822, the old church presented the curious spectacle of a double gallery. The pews were box-like affairs, with high, straight backs, the seats made of two-inch plank. As it stands to-day, the frame is all of hewn white-oak, floor of pitch-pine, and the outside covered with juniper shingles. The seats are narrow and low, with backs about three feet high. The belfry once stood out from the end of the church, and the entrances, once on the church side, are now on the east side of the belfry, with a vestibule. The belfry-roof floor is covered with lead one eighth of an inch thick, and heavy oak-timbers form the framework of the tower. The view from the top is very fine; the eye sweeps far out oceanward, and counts the white sails and dingy smoke-stacks as they pass; while east, west, and north, perfectly-cultivated fields, richly clad in green, greet the eye; the long, wide street stretches out east and west, with its magnificent growth of elms, westward, lost in its various branches to other towns, amid woods, or traced as a thread-like line near the beach, between the green pastures and the yellow sands which hold the waves in check. Eastward it stretches its line far down to lonely and romantic Montauk, said by some to be the finest sea-drive in America. At either end of this street we see the rival windmills, wherein the grain of the town is ground. One is disabled from the late northeast storm, while the sails of the other are rattling gayly in the stiff breeze, and the hoarse creaking that comes floating to our ears tells that the miller is gay and busy inside, with plenty of grist to grind. Queer things those old-style windmills; they belong to another age, as every thing else about this odd old town. "Mr. Miller," said we, "why don't you paint your mill, your shingles will last longer?" for in the innocence of our hearts we thought they looked rather new, but showed signs of failing. "Well, sir, the mill's been this way for over seventy years, and I guess it will last me." Coming slowly over the weary road from Bridgehampton, we questioned our worthy driver about these windmills. "There come along here last summer another just such chap as you, and he hadn't never seen a windmill, and he didn't know nothing about them, and he asked the all-firedest lot of questions; himby I just told him that after a long, calm spell, and there came a blow, the whole neighborhood turned out, and you might see them a running with their sacks on their shoulders to get their grist in first. They're not so mighty onsartin down here, stranger, for it does blow like forty devils sometimes."

The first minister who presided over this flock, thus strayed from the English fold, was Rev. Thomas James. He had settled in Charlestown, Massachusetts, in 1632, and came to East Hampton early in 1651. He ministered to them until 1696; then, a Mr. Jones supplied the pulpit for three years, when Rev. Nathaniel Huntting was pastor until 1753. His old age compelled him to retire, and, after some dissensions, the church united upon Rev. Samuel Buell, who officiated until 1798, and was succeeded by Rev. Lyman Beecher, who was pastor for nine years.

Mr. James was an upright, straightforward man, a strict Puritan. He requested that when he died he might be buried at a certain spot, with his head to the east, so that when he rose on the great Day he would rise facing his congregation. At that time, the church stood rather southeast of his grave, and all who had died were west of him; one hundred and seventy years, however, have placed many who knew him not east of his last resting-place. The inscription on his tombstone says:

MR.
THOMAS
JAMES DYED
THE 16TH DAY OF
JUNE IN THE
YEARE 1696. HE
WAS MINISTAR
OF THE GOSPEL
AND PASTVRE
OF THE CHURCH
OF CHRIST.

His salary was fifty pounds per year, afterward raised to sixty pounds; besides this he was exempt from land-tax, had one-fourth of the whales which came ashore, and on Monday morning his corn was to be ground before any one else's was touched. On the whale-question he was sensitive. A fine one came ashore on Napeague Beach, and the English rulers at New York claimed it as theirs. The following Sunday he preached a sermon from the text "Cursed be he that removeth his neighbor's landmark," for which he was arrested and imprisoned in New York about six months. He gave the authorities a rasping for taking his part of the whale. It is a singular fact, in this connection, that so many whales were, in those days, found thereabouts. One chronicler speaks of seeing thirteen in one day. And on the town records is, "Ordered that Goodman Mulford shall call out ye town by succession to look for whale." As late, too, as the time of Dr. Beecher, he tells us that a man, with a white jacket, was constantly stationed on a pole, near the ocean, to look for whales; when one was seen he waved his jacket and gave a loud, shrill cry, called a weft. Immediately the town was all excitement. Methinks it would take a great whale to excite them now, for a more quiet place, a more perfect relic of things one hundred years ago, and a people ditto, does not exist. Had Rip Van Winkle gone to sleep there he might awake and see no great change, yet there are few more pleasant places for the tired dweller in the city to find the needed quiet.

Rev. Nathaniel Huntting was the next pastor, and a descendant of the same name lives in the same house where the venerable minister lived and died. Rev. Dr. Buell, who followed him, was an original character, a man of great energy and an iron will. He stood by his people throughout all the trials of the Revolution. His cultivated intellect, and bold, fearless ways made him admired and respected by the British officers. Lord Erskine on one occasion had ordered the townspeople to be at South Hampton on Sunday morning with their teams. Erskine met the doctor on the street and told him of it. He replied: "I am myself commander-in-chief on that day, and have annulled the order." On another occasion, being introduced to Lord Percy, who was much ruffled because they were detained from a hunt to wait the doctor's arrival, he asked him, "What of his majesty's forces do you command?" Percy replied, "A legion of devils just from hell!" "Then," said the doctor, with a low bow, "I suppose I have the honor to address Beelzebub, the prince of devils."

The fourth minister was Rev. Lyman Beecher, whose name is known through himself and his children throughout the civilized world. Dr. Beecher found the town on his arrival there, about as it had been for the previous one hundred years. The broad street was there, but his efforts inspired the planting of the noble elms which now grace it. He, too, showed the people, by actual experiment, that they could grow apples on their soil—it had not previously been tried, because it was assumed that the salt air injured them. He, too, had the first carpet ever used in the town. It was an original one. He bought a bale of cotton; Mrs. Beecher spun it and had it wove. Then she got some paints from New York and painted handsome patterns on it. Soon after it was put down on the floor, Deacon Talmudge came to see them; he paused at the door with a look of admiration and wonder. "Walk in, deacon, walk in." "Wy I can't 'thout steppin' on it;" and, after a little pause, "D'ye think ye can have all that, and heaven too?"

PICTURESQUE AMERICA.—EAST HAMPTON, L. I.—VIEW FROM THE CHURCH BELFRY.

PICTURESQUE AMERICA.—EAST HAMPTON, LONG ISLAND.

These were the ideas of people seventy years ago, and they run in the same vein now. The summer visitors, regarded at first with distrust and suspicion, are tolerated now, because they create a home demand and higher price for products of the farm and dairy; yet Bill Gardiner, who dared to fix up a modern-style home to entertain the visitors, is looked on by the old *régime* as a desecrator, and his house a sacrilege.

Among the choir in the little chapel, we noted a very pretty young lady, with a sweet voice. Of the kind deacon, who was showing us around, and who is a lineal descendant of the aforesaid Rev. Nathaniel Hunting, we inquired her name. "That's Nettie —." We expressed surprise that so pretty a flower should blush unnoted and unknown, or at least unchanged in name, even in slow old East Hampton. "Ah," said he, "Nettie had a narrow escape last summer." "She did—how?" we eagerly inquired. "You see she is an orphan, and we all feel a guardianship over her. Well, there came a chap down here from New York to visit her, who'd seen her up there. We didn't think he was the right sort of thing, and then he stopped up to Bill Gardiner's, where he had to pay twelve dollars a week board. He was an extravagant fellow, and not the man for our Nettie, so we let him know it. It was a narrow escape, sir."

The salary paid Mr. Beecher was only four hundred dollars per year, not really as much as was paid Mr. James one hundred and twenty-five years before. He left there in 1809. Of his children, Catherine, William Henry, Edward, Mary, and George, were born there; also a daughter, Harriet, who died while an infant.

Since his time the church has had many different pastors, none staying for a great length of time. One, Rev. Samuel Hunting, a young man of brilliant talent, occupied the pulpit of his ancestor only a year, and then died, aged twenty-seven years.

But though, with changing ministers, some new ideas may have crept into the congregation, and caused the erection of a new church building, the town itself has hardly felt a spasm of change since 1800. The traveller leaves behind him the age of progress, the nineteenth century of wonders, when he leaves the railroad; every onward step carries him more deeply into things of the past, relics of days which good old grandfather talked of beside the glowing oak-fire in the old New-England home; every house reminds him of a style of architecture which we found pictured in the odd old geography that we rummaged from the queer, iron-bound trunk that held mother's precious things. As he enters the town the same broad street, through which the voice of the crier rang two hundred years ago, stretches out before his eyes. A pretty little lake, and the solemn old graveyard, give beauty and solemnity to the scene. For a mile before him stretches out this wide street, and on either side are ranged the houses of the townspeople, with their farms in the rear—the same farms, the same names owning them, and, in most instances, the same houses, which existed one hundred and fifty years ago.

East Hampton must be seen to be appreciated. One may go to New England and look at a village said to be two hundred years old, but there all is modernized; the busy clatter of the loom or hum of other machinery destroys romantic musings or old-time ideas. All there is materialistic, practical, of the present; here all is of the past, and the mind requires no effort to people this great street with the queer costume and ascetic manners of our ancestors of Plymouth Rock; to imagine them with slow and measured tread wending their way to and into the old church. Every thing around—the grand old elms, a few great oaks, the square, box-like houses, with their shingled sides all unpainted—all enforce forgetfulness of the rushing present, and bring up soothing visions of the calm old days of the past, visions of days sweet with childhood's recollections. Here, too, may be enjoyed in all purity unrivalled sea-air and sea-bathing, without the silly fashions of Long Branch or Cape May, or the stiff grandeur of Newport. Here are quiet and rest for the weary, a table spread with plenty, and a home without fashion.

The wide street is simply a great lawn, richly green with a thick mat of grass, common to all, and through it runs several tracks for vehicles. A horrid innovation has lately been enforced by legislative enactment, compelling the narrowing of the road-track to four feet eight and a half inches—New-York gauge. But few farm-vehicles were less than six feet—the only place in America I am informed where they are so wide. Another innovation in the shape of a railroad has been proposed; they do not want it. We spoke of it to one. He said: "They say it will increase the value of our lands. Well, if

it does, that's only more taxes. We don't wish to sell them, then why have them worth more than now?" One of their laws of two hundred and twenty years ago was: "That no townsman should sell his land to any one unless that purchaser was acceptable to the town." The same feeling, to some extent, exists now, and new settlers are not desired by the great majority.

Just a half mile from the straight, wide street runs parallel to it the ocean-beach. Down to it is a carriage-road and a foot-way, the latter, by the old records, called the Mill Road, because near where it left the street stood the first mill—which, we are informed, was run by ox-power. The beach is said to be a fine one for bathing, and the opportunities for blue-fishing unsurpassed.

To Dr. Hedges, a lineal descendant of one of the original settlers, we are indebted for much information, as also to Mr. David Hunting. Long may they live to perpetuate the noble names they bear, and may good, genial old-style East Hampton never know a change from the past to modern ideas! Illustrious in the noble names she bears in her town records, and which still remain within her limits, those she has sent forth have ever reflected back honor on their birthplace and paternal home—the Talmadges, the Conklings, the Gardiners, and that name around which is linked so much of sadness and joy—John Howard Payne.

HENRY E. COLTON.

DARWINISM.

THE great interest excited by Mr. Darwin's latest work, "The Descent of Man," induces us to copy, from the *New-York Tribune*, the following clear and concise summary of its argument, and of Darwinism generally, written by Mr. George Ripley:

"Not a little curiosity has been awakened with regard to the contents of the present work, the purpose of which is to apply the principles of Natural Selection to the explanation of the origin or descent of the human race. The main questions to which it is devoted relate to the gradual evolution of man, like every other species, from a certain preëxisting form, and to the manner of his development. The conclusion at which the author arrives, after a long process of investigation, is that man is the co-descendant with other species of some ancient and lower form, which became extinct at a period anterior to any records of human experience.

"The evidence of the descent of man from some lower form is sought by the author, in the first place, from the correspondence between his physical structure and that of the lower animals. Man is constructed on the same general type with other mammals. The bones in his skeleton can be compared to those in a monkey, bat, and seal. So it is with his muscles, nerves, blood-vessels, and internal viscera. The brain follows the same law. Man is liable to receive certain diseases from the lower animals, like hydrophobia, variola, the glanders, and others, which he also communicates to them in return. This fact proves the close similarity of their tissues and blood, both in minute structure and composition. Monkeys are liable to many of the same non-contagious diseases that we are. One species that was carefully observed for a long time in its native land was found subject to catarrh, with the usual symptoms, and which when often recurrent led to consumption. They suffered also from apoplexy, inflammation of the bowels, and cataract in the eye. Medicines produced the same effect on them as on us. Many kinds of monkeys have a strong taste for tea, coffee, and spirituous liquors. They will also, as Mr. Darwin has himself seen, smoke tobacco with pleasure. The natives of North-eastern Africa catch the wild baboons by exposing vessels with strong beer, by which they are made drunk. These facts prove how similar are the nerves of taste in monkeys and man, and how similarly their whole nervous system is affected. It is, in short, scarcely possible to exaggerate the correspondence in general structure, in the minute structure of the tissues, in chemical composition, and in constitution, between man and the higher mammals, especially the anthropomorphic apes.

"A fact of curious interest, on which Mr. Darwin dwells at considerable length, is the presence in the higher animals of certain organs in a rudimentary condition, such as the mammae of male quadrupeds, or the incisor-teeth of ruminants which never cut through the gums. Rudiments of various muscles have been observed in many parts of the human body. Not a few muscles, which are regularly present in some of the lower animals, can occasionally be detected in man in a greatly-reduced condition. The power which many animals, especially horses, possess of moving or twitching their skin, is due to a muscle, of which the remnants in an efficient state are found in various parts of our bodies; for instance, on the forehead by which the eyebrows are raised. Some persons have the power of contracting the superficial muscles on their scalps, and these muscles are in a partially rudimentary condition. M. de Candolle communicated to the author a

singular instance of the inheritance of this power, as well as of its unusual development. 'He knows a family in which one member, the present head of a family, could, when a youth, pitch several heavy books from his head by the movement of the scalp alone; and he won wagers by performing this feat. His father, uncle, grandfather, and all his three children, possess the same power to the same unusual degree. This family became divided eight generations ago into two branches; so that the head of the above-mentioned branch is cousin in the seventh degree to the head of the other branch. This distant cousin resides in another part of France, and, on being asked whether he possessed the same faculty, immediately exhibited his powers. This case offers a good illustration how persistently an absolutely useless faculty may be transmitted.' The extrinsic muscles which serve to move the whole external ear, and the intrinsic muscles which move the different parts, are in a rudimentary condition in man, and are also variable in development. Mr. Darwin has seen one man who could draw his ears forward, and another who could draw them backward. He remarks that, from what he was told by one of those persons, it is probable that most of us, by often touching our ears, and thus directing our attention toward them, could, after repeated trials, recover some power of movement. There is a little peculiarity in the external ear, pointed out by a celebrated sculptor, which is common to man and to monkeys. This consists in a small blunt point, projecting from the inwardly-folded margin, and visible when the head is viewed from directly in front or behind. These points are variable in size and position, standing either a little higher or lower, sometimes occurring on one ear, and not on the other. Mr. Darwin concludes that the occasional reappearance of this feature in man is a vestige of formerly-pointed ears, a dim sense of which was doubtless the origin of the legend which Hawthorne has turned to such admirable account in his weird creation of the 'Marble Faun.'

"Mr. Darwin mentions, as a noteworthy circumstance, that the posterior molar or wisdom teeth appear to be tending toward the rudimentary state in the more civilized races of man. These teeth are rather smaller than the other molars, as is the case with the corresponding teeth in the chimpanzee and the orang. They have only two separate fangs, and do not cut through the gums, till about the seventeenth year. They are much more liable to decay, and are earlier lost than the other teeth. In the Milanian races, on the other hand, wisdom teeth are usually furnished with three separate fangs, and are generally sound. They also differ from the other molars in size less than in the Caucasian races. The difference between the races is accounted for by the fact that the posterior dental portion of the jaw is shortened in those that are civilized, and this shortening may be attributed to the habit of feeding on soft, cooked food, and thus making less use of the jaw. In illustration of this point, Mr. Darwin was informed by a distinguished American traveller that it is becoming quite a common practice in the United States to remove some of the molar teeth of children, as the jaw does not grow large enough for the perfect development of the normal number.

"The bearing of the argument from the existence of rudimentary organs in the human system is easy to be understood. The homological construction of the whole frame in members of the same class is intelligible, if we admit their descent from a common progenitor, together with their subsequent adaptation to diversified conditions. On any other view it is impossible to account for the similarity of pattern between the hand of a man and monkey, or for the foot of the horse, the flipper of the seal, or the wing of the bat. It does not help the matter to say that they have all been formed on the same ideal plan. Nor can any explanation but that of a common progenitor account for the wonderful fact that the embryo of a man, a dog, a seal, or a bat, can at first hardly be distinguished from each other. The presence of rudimentary organs only becomes intelligible when we suppose that a former progenitor possessed the parts in question in a perfect state, and that under changed habits of life they were greatly reduced. We are thus enabled to see how man, and all other vertebrate animals, have been constructed on the same general model, why they pass through the same early stages of development, and why they retain certain rudiments in common. Hence, argues Mr. Darwin, we are bound to admit their community of descent. To take any other view is to admit that our own structure, and that of all the animals around us, is a mere illusion to lead the judgment astray.

"The questions suggested by a comparison between the mental faculties of man and the lower animals, present more serious difficulties on the theory of Natural Selection than those involved in their physical differences and resemblances. Even Mr. Wallace, one of the ablest supporters of the doctrine, who was led to its adoption by his own independent personal researches as a naturalist, hesitates to apply it to the explanation of the phenomena of mind, at least to the extent to which it is carried by Mr. Darwin. But the latter makes no exception to the sufficiency of the principle. His reasonings concerning its application to the mental powers are marked by singular ingenuity, and doubtless form the most significant portions of the present volume, although there are few thinkers but will pause before admitting their validity. He takes the position that there is no fundamental difference between man and the higher mammals in their mental faculties. As man possesses the same senses with the lower animals, his fundamental intuitions must be the same. He has also some in-

stincts in common with them, as that of self-preservation, sexual love, the love of the mother for her new-born child, and so forth. But man has perhaps fewer instincts than those possessed by the animals which come next to him in the series. The lower animals, like man, evidently feel pleasure and pain, happiness and misery. There is no happier sight than that of young animals, such as puppies, kittens, lambs, and the like, when playing together, like our own children. The lower animals are excited by the same emotions as ourselves. Terror, for example, acts in the same manner on them as on us, causing the muscles to tremble, the heart to palpitate, the sphincters to be relaxed, and the hair to stand on end. Suspicion, the offspring of fear, is eminently characteristic of most wild animals. Every one knows how liable animals are to furious rage, and how plainly they show it. The love of a dog for his master is notorious. Animals not only love, but have the desire to be loved. They feel emulation, and love approbation or praise. A dog carrying a basket for his master exhibits a high degree of pride. The dog also feels shame, as distinct from fear, and something very like modesty when begging too often for food. Several observers have stated that monkeys certainly dislike being laughed at; and they sometimes invent imaginary offences. A baboon in the Zoological Gardens always got into a rage when his keeper took out a letter or book and read it aloud to him; and his rage was so violent on one occasion, which Mr. Darwin witnessed himself, that he bit his own leg till the blood flowed. Animals enjoy excitement and suffer from *ennui*, as may be seen with dogs and monkeys. They feel wonder and curiosity. 'Brehm gives a curious account of the instinctive dread which his monkeys exhibited toward snakes; but their curiosity was so great that they could not desist from occasionally satiating their horror in a most human fashion, by lifting up the lid of the box in which the snakes were kept. I was so much surprised at his account, that I took a stuffed and coiled-up snake into the monkey-house at the Zoological Gardens, and the excitement thus caused was one of the most curious spectacles which I ever beheld. Three species of *Cercopithecus* were the most alarmed; they dashed about their cages and uttered sharp signal-cries of danger, which were understood by the other monkeys. A few young monkeys and one old Anubis baboon, alone took no notice of the snake. I then placed the stuffed specimen on the ground in one of the larger compartments. After a time all the monkeys collected round it in a large circle, and, staring intently, presented a most ludicrous appearance. They became extremely nervous; so that when a wooden ball, with which they were familiar as a plaything, was accidentally moved in the straw, under which it was partly hidden, they all instantly started away. These monkeys behaved very differently when a dead fish, a mouse, and some other new objects, were placed in their cages; for, though at first frightened, they soon approached, handled, and examined them. I then placed a live snake in a paper bag, with the mouth loosely closed, in one of the larger compartments. One of the monkeys immediately approached, cautiously opened the bag a little, peeped in, and instantly dashed away. Then I witnessed what Brehm has described, for monkey after monkey, with head raised high and turned on one side, could not resist taking momentary peeps into the upright bag, at the dreadful object lying quiet at the bottom. It would almost appear as if monkeys had some notion of zoological affinities, for those kept by Brehm exhibited a strange, though mistaken, instinctive dread of innocent lizards and frogs. An orang, also, has been known to be much alarmed at first sight of a turtle.'

"Many animals have the power of imitation; all have the faculty of attention. They have excellent memories for persons and places. Nor are they destitute of imagination, or of the reasoning faculty to a certain extent. 'Many facts have been recorded in various works showing that animals possess some degree of reason. I will here give only two or three instances, authenticated by Rengger, and relating to American monkeys, which stand low in their order. He states that when he first gave eggs to his monkeys, they smashed them and thus lost much of their contents; afterward they gently hit one end against some hard body, and picked off the bits of shell with their fingers. After cutting themselves only once with any sharp tool, they would not touch it again, or would handle it with the greatest care. Lumps of sugar were often given them wrapped up in paper; and Rengger sometimes put a live wasp in the paper, so that in hastily unfolding it they got stung; after this had once happened, they always first held the packet to their ears to detect any movement within. Any one who is not convinced by such facts as these, and by what he may observe with his own dogs, that animals can reason, would not be convinced by any thing that I could add.'

"It has been alleged that man alone is capable of progressive improvement. But every one who has had any experience in setting traps knows that young animals can be caught much more easily than old ones. With respect to old animals, it is impossible to catch many in the same place, and in the same kind of trap, or to destroy them by the same kind of poison. They learn caution by seeing their brethren caught or poisoned. Our domestic dogs are descended from wolves and jackals, and, though they may not have gained in cunning, they have advanced in certain moral qualities, as in affection, trustworthiness, temper, and probably in general intelligence. The common rat has conquered several other species throughout Europe, in parts of North America, New Zealand, and China. The victory over a much larger

kind may be ascribed to the superior cunning of the common rat; and this quality is probably due to the habitual exercise of all its faculties in avoiding extirpation by man, as well as to his having successively destroyed nearly all the less cunning or weak-minded rats.

"It has often been said that no animal uses a tool. But the chimpanzee in a state of nature cracks a native fruit, somewhat like a walnut, with a stone. An American monkey has been taught to break open hard palm-nuts, and afterward, of its own accord, it used stones to open other kinds of nuts, as well as boxes. It thus also removed the soft rind of fruit that had a disagreeable flavor. Another monkey was taught to open the lid of a large box with a stick, and afterward it used the stick as a lever to move heavy bodies. In these cases, stones and sticks were employed as implements; but they are likewise used as weapons. In Abyssinia, when the baboons of one species descend in troops from the mountains to plunder the fields, they sometimes encounter troops of another species, and then a fight ensues. The first party rolls down great stones, which the others try to avoid, and then both species rush furiously against each other with a terrible uproar. A monkey in the Zoological Gardens, which had weak teeth, used to break open nuts with a stone. The same animal, after using the stone, would hide it in the straw, and would not let any other monkey touch it. Here we have the idea of property, but this idea is common to every dog with a bone, and to most or all birds with their nests.

"We have selected a few of the popular illustrations which are brought by Mr. Darwin to explain the affinities between man and the inferior animals, which, in his view, compel us to refer the origin of both to a common, but long since extinct, progenitor. They afford an example of the scope and method of his reasonings, but present only an imperfect idea of the variety and richness of his suggestions. Many of the topics of primary importance in the discussion, and which he unfolds at length, cannot even be alluded to in our limited space, and we must refer our readers for their explanation to the volume itself. A word or two as to the development of the 'rude forefathers' of our race must close this imperfect notice. In the primeval state of society, the individuals who were the most sagacious, who invented and used the best weapons or traps, and who were best able to defend themselves, would rear the greatest number of offspring. The tribes with the largest number of men thus endowed, would increase in number and supplant other tribes. As soon as the progenitors of man became social (which probably occurred at a very early period) the mental faculties would receive an important aid in the principle of imitation, together with reason and experience. The habitual practice of each new art must, in some slight degree, strengthen the intellect. In order that primeval men, or 'the ape-like progenitors of man,' should have become social, they must have acquired the same instinctive feelings which impel other animals to live in a body. They would have felt some degree of love for their comrades; they would have warned each other of their danger; and have given mutual aid in attack or defence. This implies a certain amount of sympathy, fidelity, and courage. A tribe possessing such qualities in a high degree, would be victorious over other tribes, but in course of time would, in its turn, be overcome by some other and still more highly-endowed tribe. Thus the social and moral qualities, which now form the chief distinction of the race, would tend slowly to advance and be diffused throughout the world.

"Whatever judgment may be pronounced as to the tendency of Mr. Darwin's views of the origin of man to humble the natural pride of ancestry, we ought not to lose sight of the fact that no philosophical writer of the present day sets forth a more exalted conception of the actual faculties and endowments of the race as developed under the highest forms of moral and religious culture in the progress of civilization. He almost goes out of his way to do justice to the ideas and beliefs which have been regarded by the wisest thinkers in every age as the crowning glory of humanity. In this respect, his system presents a favorable contrast to the shallow, sensualistic, French philosophy of the eighteenth century, which resolves the most refined sentiments of our nature into fleshly illusions. 'The question,' says Mr. Darwin, 'whether there exists a Creator and Ruler of the Universe has been answered in the affirmative by the highest intellects that have ever lived. I fully subscribe to the judgment of those writers who maintain that of all the differences between man and the lower animals, the moral sense or conscience is by far the most important. This sense, as Mackintosh remarks, 'has a rightful supremacy over every other principle of human action;' it is summed up in that short but imperious word *ought*, so full of high significance. It is the most noble of all the attributes of man, leading him, without a moment's hesitation, to risk his life for that of a fellow-creature; or after due deliberation, impelled simply by the deep feeling of right or duty, to sacrifice it in some great cause.'"

FREDERIC CHOPIN.

THOUGH his works are generally well known and admired, the life of Frederic Chopin appears to many almost mythical and without form. His days were indeed short, but by no means void of

interest and usefulness. Though great in the sphere in which he labored, the world seems not to have awarded him that praise and honor deserved by his abilities. His mind and powers were not inferior to those of Mozart, notwithstanding that the latter sheds a more brilliant light. Unlike the masters in general, he confined all his practice to the piano-forte alone; and the skill with which he handled that instrument has won for him the honor of being the greatest pianist on record.

Born in 1810, at a small village near Warsaw, the early days of his youth occasioned no little anxiety to his parents; for his constitution was frail and sickly, and the breath of life seemed barely sufficient to maintain his existence. It was doubtless his calm and patient endurance of suffering which gave rise to his affability and gentleness in after-life, and rendered him an object of universal love and admiration.

At the early age of nine years he began the study of music, seeking, as it were, in its hallowed charms, a solace for his cares and afflictions. One year later he won the esteem of Madame Catalini, the world-renowned *cantatrice*, who presented him with a watch, bearing the following inscription: "Madame Catalini to Frederic Chopin, aged ten years."

Soon after he was placed under the care of Ziwna, the earnest disciple of Sebastian Bach, and, by the favorable influence of the Prince Radziwill, he was enabled to pursue an extended course of study in accordance with the most classic models.

In early youth Chopin formed an attachment for a young lady who lived in the same village. She was his first love, kind, true, and affectionate, and possessing no small degree of beauty. They had played together when children, and had looked forward into the future with the brightest dreams of happiness. But, during one of the tempests which have so often afflicted the political life of Poland, Chopin was obliged to leave his native land—an exile. It was a separation, not only from parents, kinsmen, and friends, but alas! from her who had cheered his youth, and who might have prolonged his years. She, heart-broken and sad, found an early grave; he, a stranger among strangers, lived a few years, and died lamenting her.

Chopin was introduced into the most noted society of the day, and won tokens of respect from the highest classes. He was accomplished in other arts than music. His knowledge of the classics was great, and his proficiency in *belles-lettres* was only equalled by the eagerness with which he sought that branch of literature. In music he was an expert, and was already pronounced a *maestro*. He was also a poet, not unworthy of his poetic nation, among whose bards are some that rank among the first in the world.

In his choice of musical productions, the Italian school of art was always held by him in the greatest distaste. With the exception of a few melodies, the works of Schubert were displeasing. Those in which there existed the least sharpness in the *contours*, he would not listen to. He once remarked of Schubert, that "the sublime is desecrated when followed by the trivial or commonplace."

Among the piano-composers, Hummel was his most admired, but Mozart his *beau idéal*. Chopin left Warsaw at the breaking out of the revolution of the 29th of November, 1830. After visiting many of the German cities, he finally settled in Vienna. Here he gave concerts, but they met with little appreciation. Then he determined to go to London, *via* Paris. It is said that, "upon his passport drawn up for England, he had caused to be inserted, 'passing through Paris.' These words sealed his fate. Long years afterward, when he seemed not only acclimated but naturalized in France, he would smilingly say, 'I am passing through Paris!'"

In Paris he gave many concerts, and met with success. About this time Madame George Sand shone as a flaming torch in Parisian society. Her accomplishments were such as are rarely met with. She had already written and published her "Indiana," "Valentine," and her "Lélia," that most delightful prose-poem of French literature. Hearing of Chopin's abilities, she naturally longed for an acquaintance with him.

Strange to say, the musician feared Madame Sand more than any other woman in France, because she possessed a spirit so bold and daring, and a will so sternly inflexible.

At last, however, they met, and an intimacy arose, lasting until death separated the two.

In 1837 Chopin was attacked by a severe illness, and his physician advised him to seek rest in the sunny south. Madame Sand,

with the usual kindness of her sex, offered to accompany him. The island of Majorca was selected. It is hard to tell whether it was the gentle sea-breezes, and the mild, delightful climate of their retreat, or the tender, fostering care of his companion, which restored him to health, and enabled him once again to revisit Paris. Surely the love of the woman did not fail in its beneficent influence.

Toward the year 1840, and thereafter, the health of Chopin again began to fail. Notwithstanding this, he kept busily at work, and each year brought many compositions to Paris from his quiet abode at Nohaut.

From 1846 onward he could not use his limbs, and his affliction grew so fearful that his life was daily despaired of. M. Gutman, his favorite and pupil, was with him constantly. The close of 1847 found him much better. Hopes were revived, and longer days on earth were dreamed of.

During the Revolution of 1848 he was confined to his bed, but apparently took an interest in passing events.

In August he felt so relieved that he made a journey to England, where he was received with great distinction. There he gave two public and many private concerts. He was presented to the queen by the Duchess of Sutherland. He went to Edinburgh, and was there the subject of extended praise and admiration.

Returning to Paris, he patiently awaited the final summons. The festivity and excitement to which he had been recently subjected proved too much for him. That constitution which time had for years been undermining was soon to sink, and already the work of dissolution had begun.

On the morning of the 17th of October, 1849, the artist, in a low and scarcely-audible tone, whispered, "Who is near me?" Learning that it was his friend M. Gutman, Chopin bent his head to kiss the hand of his much-esteemed pupil; and, while performing this last token of affection, he died, as he had lived—in love.

Mozart's celebrated *requiem* was performed at the funeral, which took place, with much display, at the Madeline Church, on the 30th of October, 1849.

Of the works of Chopin, mention need scarcely be made. In all his compositions there is boldness, but no harshness; every strain is rich, but clear and distinct. The formation shows an artistic hand, and the coloring and luxurious ornament betray a master unrivalled in his skill and ingenuity.

They are written in the highest style of brilliancy and art, but never is the truly sublime injured by the introduction of the trivial or the commonplace.

His *nocturnes*, *ballades*, *impromptus*, and *scherzos*, stand unsurpassed in their refined harmony and delicacy of embellishment. All are marked by a startling originality.

His *Polonaises* have not received that amount of study which they deserve, owing to the extreme difficulty of rendering them accurately, but they are, nevertheless, the products of his greatest power and inspiration. Their tone is martial, and brings before our minds the fiery ardor and courage of his countrymen. Though natural in their effects, they never fail to remind one of the almost superhuman spirit which gave them birth.

It is only within a very few years that the works of Chopin have met with any degree of reception in this country. At first they appeared in the concert-room under the hand of the *virtuoso*, then were performed by orchestras, and now, happily enough, they take places in our choicest *répertoires*.

They are not merely the productions of an expert, but of a master; therefore they demand a great deal of study and perseverance before their excellences are revealed. They are, on the whole, a sort of *odd beauties*, and oddity, by the general rule, cannot be understood and appreciated without close study and examination beforehand.

The American conservatories of music have done more to regenerate and purify the study of the masters in this country, than all the private instructors put together. They are noble institutions, and should be looked upon by the citizens, in common with the public schools, as the refiners of taste, discipline, and morality, and a God-sent blessing upon our youth. Instead of having to ask the parents for information as to Haydn, Beethoven, or Chopin, our sons and daughters have themselves become the instructors in the household. And it will be a glorious day when this happiness shall have become universal.

GEORGE LOWELL AUSTIN.

OUTGROWN.

NAY, you wrong her, my friend, she's not fickle; her love she has simply outgrown;
One can read the whole matter, translating her heart by the light of one's own.

Can you bear me to talk with you frankly? There is much that my heart would say,
And you know we were children together, have quarrelled and "made up" in play.

And so for the sake of old friendship, I venture to tell you the truth,
As plainly, perhaps, and as bluntly, as I might in our earlier youth.

Five summers ago when you wooed her, you stood on the self-same plane,
Face to face, heart to heart, never dreaming your souls could be parted again.

She loved you at that time entirely, in the bloom of her life's early May,
And it is not her fault, I repeat it, that she does not love you to-day.

Nature never stands still, nor souls either. They ever go up or go down;
And hers has been steadily soaring—but how has it been with your own?

She has struggled, and yearned, and aspired—grown purer and wiser each year;
The stars are not farther above you, in yon luminous atmosphere!

For she whom you crowned with fresh roses, down yonder five summers ago,
Has learned that the first of our duties to God and ourselves is to grow.

Her eyes they are sweeter and calmer, but their vision is clearer as well;
Her voice has a tenderer cadence, but is pure as a silver bell.

Her face has the look worn by those who with God and His angels have talked;
The white robes she wears are less white than the spirits with whom she has walked.

And you? Have you aimed at the highest? Have you, too, aspired and prayed?
Have you looked upon evil unsullied? have you conquered it undis-
mayed?

Have you, too, grown purer and wiser, as the months and the years have rolled on?
Did you meet her this morning rejoicing in the triumph of victory won?

Nay, hear me! The truth cannot harm you. W'en to-day in her presence you stood,
Was the hand that you gave her as white and clear as that of her womanhood?

Go measure yourself by her standard. Look back on the years that have fled;
Then ask, if you need, why she tells you that the love of her girlhood is dead!

She cannot look down to her lover; her love, like her soul, aspires;
He must stand by her side, or above her, who would kindle its holy fires.

Now, farewell! For the sake of old friendship I have ventured to tell you the truth,
As plainly, perhaps, and as bluntly, as I might in our earlier youth.

JULIA C. R. DORR.

TABLE-TALK.

IN every art the attention is apt to be diverted from the essential principle to the difficulties of the method. Amateurs and connoisseurs are especially prone to over-estimate technical triumphs, and to lose sight sometimes of the real purpose of an art in admiration for dexterity. Music, for instance, is designed to produce various impressions upon the imagination by means of certain concords of sounds. The methods by which these results may be secured are the study of the musician, and the difficulties of accomplishing his end are known to be great. But the connoisseur, who first begins by delighting in the product of the musician's skill, is apt gradually to transfer his admiration from the music to the method, and so, in the end, is often far more enamoured of manual dexterity and ingenious devices, than of the concords which this skill is merely the vehicle for producing. There is no doubt that the essential quality of an art is thus often lost sight of altogether. People who extol a performer because he has executed a difficult piece of music on the piano with one hand, or by any other dexterous process, have a right to their admiration; but their critical perceptions are greatly confused, if they do not perceive that it is not the music but the legerdemain of the thing they are applauding. There are more amateurs in music than in any other art—more who have some sort of understanding of the great physical difficulties that pertain to it, and hence we find generally not merely a better appreciation of the skill or dexterity that can overcome them, but a greater disposition than we find in regard to other arts to exalt the importance of these difficulties. "Have you seen," cry out certain critics, "Signor Teutorini play 'Yankee Doodle' with his elbow? It is wonderful! Go and see it by all means." Now, this sort of thing is really as absurd as if one should say: "Have you read Peter Smith's new novel? A wonderful work! Every line of it was written with the pen held between his toes! Oh, it is splendid!" Or, in art, if we should hear that "Jack Palette's new picture is marvellous! Painted every bit of it while he was standing on his head! A wonderful picture!" Of course, legitimate dexterity—that is, that skill which enhances effects—is entitled to our admiration, but not that sort of skill which is simply a device for extorting surprise or wonder. Novelties in art have their place among the vulgar curiosities of a show; they are no higher than the tricks of the necromancer or the dexterity of acrobats. It is not surprising that artists should sometimes over-estimate the manual or other difficulties of their art, in view of the long and patient study required to overcome them; but this disposition often leads to a substitution of mechanism for expression, of tricks and ingenuities for feeling, and, plucking from art its life and soul, gives to it mere pedantry and form.

— If the news from England be true, our trousers are doomed to speedy extermination. With the opening of spring, it is authoritatively stated, the new style of nether habiliments, known as knickerbockers are

to come into general vogue all through her majesty's dominions. This, of course, is only a forerunner of our own fate, for the beaux of Fifth Avenue will not be long in accepting the dictum of the swells of Regent Street. Some will hail this new radical change in our dress with delight; others, of course, with alarm and apprehension. The thin-legged men, however, need not despair; for art is very potent in correcting the mistakes, or in supplementing the omissions, of Nature. Calves can be made warranted to fit the straightest and most undeveloped limbs, and to give them every grace and shapeliness. The difficulty, at first, will be in obtaining a supply sufficient for the demand. Calf-makers, however, would probably rapidly spring up in all quarters, and ere long the new traders would become as abundant as dentists or cobblers. Trousers have certainly held their own exceedingly well, especially in view of the fact, or tradition, that they were invented by a famous beau as a means of concealing a defect in his leg. The inventor did not know what a blessing he was conferring upon thin-legged unfortunates. Trousers have, in their long history, undergone not a few changes. Half a dozen years ago they hung around the limbs in vast plenitude of cloth; a dozen years ago they clung to the limbs almost as tightly as the old-fashioned breeches; twenty years ago they were worn stretched down to, fitted over, and strapped to the boot, in a manner that rendered sitting or walking far from comfortable. The comparatively recent invention of the spring-bottom—a method of cutting, simply, we believe—enables the trousers to fall gracefully over the boot without the aid of the strap, lacking which the leg of the trousers had previously reached the boot in a clumsy and inelegant manner. If trousers are really to go out, some one of our learned tailors should give us a history of their invention and vicissitudes. We are inclined to think, however, that the knickerbockers will have a long struggle of it. Trousers are thoroughly well grounded in the estimation of a large majority. They are respectable, and, at the same time, democratic—bringing handsome legs down to the level of poor legs, and setting up every man on his pins in perfect equality with his neighbor. They have an ugly way, it is true, of bagging at the knees, which the knickerbockers would not; but conservatism sticks to its old pains as well as to its old delights. They are prone to be troublesome to those walkers who interfere, and often gather up not a little mud and moisture at rainy seasons; but these are all evils that we bear rather than fly to; others we know not of. Our beaux may hesitate a little in adopting the knickerbockers, may want the courage to boldly step out into Fifth Avenue dressed in the novelty; but the coming summer-vacation will afford young gentlemen first-rate opportunities to experiment with them a little. They would look very well on the croquet-ground, on a mountain-ramble, in the pleasure-boat; and, once thus familiarized, the transition to our town-promenades would be comparatively easy.

— We believe that the spirit of heroism is more abundant and more frequently exhibited than is commonly accorded. The en-

gineer who heroically remained at his post, at the recent New Hamburg disaster on the Hudson River Railway, has been extolled far and wide with too much depreciation of average human nature in these emergencies. "A few times in every one's memory," says one writer, "some act of magnificent self-abnegation comes out to redeem the untold meanness and grossness that make one ready to prove utterly faithless." Do not these acts occur many times in every one's memory? They are not always accompanied with those circumstances that conspicuously fix the attention of the world, and yet there is rarely a great disaster that has not at least one incident of heroism to fire the enthusiasm of mankind. If one were to follow up carefully the records of all the shipwrecks on our coast, is it not certain that he would have material for a Book of Heroes? How often captains, like the heroic engineer, remain steadfastly at their post, and go down to death and darkness with their ships! How often do we hear of heroic efforts to rescue shipwrecked men! Wherever there is danger we may be sure to discover that spirit of self-abnegation that makes heroes. It exhibits itself in every battle, in every march, in every storm-tossed vessel, in thousands of places where the eye of the chronicler cannot reach. Nor is the heroism of the world displayed only in cases of danger. Many men live long lives without ever encountering the necessity or having the occasion to show their mettle in this way, and yet who daily enact their heroisms. Heroism is in fortitude as well as in courage; it is moral as often as it is physical. There are men who, like the engineer at New Hamburg, remain steadfast at their posts through many dangers, and many trials; who, impelled by strict regard for duty, sacrifice health and all the sweetness of life in honorable fealty to others. There are fathers and husbands whose prolonged years are but one record of self-suppression. There are wives and mothers whose lives are made up of self-devotion. Obligation and duty are the woof and web of ordinary experience, and there are but few of us who are below or can claim to be above the burdens they impose. The admiration which heroism inspires could not exist if the world were filled with "untold meanness and grossness." We are all prone, whenever heroism is enacted under picturesque or dramatic conditions, to exalt it too much above the daily self-sacrifice of other men; but the heart of human nature in its sympathy for these acts of self-abnegation proves that it is not so bad as the cynics paint it.

— Whatever men may think of the captive of Wilhelmshöhe, a certain tender interest cannot but linger around her who added to his splendor and who now shares his misfortunes. It is said of the empress, by those who knew her personally, that she was particularly attentive to all the minor politenesses of life, and never failed in courtesy to those about her. One day two young Americans were sauntering along a narrow street in Paris, which, as was often the case, had no sidewalks to protect pedestrians from passing vehicles. As the young men approached a corner, there suddenly wheeled around, into the street where they were, a man on horseback,

going at a goodly pace. One of the young men was for going on after the horseman had passed, but the other, more versed in the ways of Paris, from longer residence, drew him by the arm under the shelter of the wall, close to the corner, exclaiming: "Wait! That is an imperial outrider; probably the empress is coming; I know the livery." He had hardly time to speak these words, before there was a rattle of hoofs and wheels, and around the corner swept a magnificent carriage with all the insignia of imperial rank; there was no time to admire the horses, or the liveries, or do any thing else but gaze into the carriage, for there sat, calm as a summer morning, and beautiful as spring, the empress herself, with some other lady at her side. The young men instinctively raised their hats and bowed. Perhaps the empress saw that they were strangers—not "to the manor born"—or it may have been only her accustomed manner of returning salutes; at all events, she smiled most pleasantly, and bowed in the most gracious manner to the young men. Then the brilliant *cortège* swept on, leaving with the strangers the memory of a lovely vision to be carried to their distant homes, and often thought of in these disastrous days of France and the empress.

Literary Notes.

THE London *Saturday Review* regrets that Mr. St. George Mivart's "Genesis of Species" had not appeared before the "Descent of Man," inasmuch as it would have put it within Mr. Darwin's power to have included in his work a suitable survey of Mr. Mivart's position. "In no work in the English language," says the *Review*, "has this great controversy been treated at once with the same bread and vigorous grasp of facts, and the same liberal and candid temper. The range and depth of Mr. Mivart's learning are as conspicuous as that unvarying courteousness of tone which we have been by no means used to meet with in most phases of the same strife. His strategy is not carried on, indeed, as is often the case, along the whole breadth of the line. It forms no part of his position to decry as false or baseless, still less to ridicule, as has been so often the case with more forward or less thoughtful critics, the whole conception of Natural Selection. From the 'more or less crude conceptions' which have been put forth by most of the opponents of Messrs. Darwin and Wallace he is eager to dissociate himself. What he rather expects and aspires to forward as the ultimate solution of the problem is the development of some *tertium quid*, 'the resultant of forces coming from different quarters, and not coinciding in direction with any one of them.' Far from denying to Natural Selection the place of a true cause in the evolution of organic differences, he would yet see in it but one out of many concurrent principles of differentiation. Its beautiful simplicity, its applicability to the details of geographical distribution, to rudimentary structure, to homology, to mimicry, and other branches of physiological investigation, are fully recognized by him. The antagonism supposed by many to exist between it and theology is declared by him to be neither necessary nor universal. What Mr. Mivart insists upon is that the theory of Natural Selection, however supplemented and aided by that of Pangenesis, though true, is not the whole truth; that it can be shown

to be quite insufficient to explain a number of important phenomena connected with the Origin of Species, and that it must, in consequence, itself be capable of being merged in some higher law, aided and supplemented by some more recondite agency."

Some German periodicals have gained very largely in circulation since the breaking out of the present war. The *Cologne Gazette*, which, on the 1st of June, 1870, had only fourteen thousand subscribers, has now forty thousand. The *Gartenlaube* obtained, from the 15th of June to the 15th of October, 1870, thirty thousand subscribers. The same increase is claimed for *Weber's Leipzig Illustrated News*. Hackländer's *Stuttgart Illustrated News* (*Ueber Land und Meer*) even claims to circulate now one hundred thousand copies more than it did at the beginning of the war.

Among new periodicals in Europe is a Dutch fortnightly review, under the title of "Our Century," and a new weekly periodical in Constantinople printed in modern Greek, and designed chiefly for female readers, with a view to promote their intellectual development. This, from Constantinople, is a significant sign of the times.

The second volume of Darwin's "Descent of Man" will appear during the present month. The interest evinced in this remarkable work is very great. Probably no scientific discussion has extended so widely among general readers as that raised by Mr. Darwin.

The war has given rise in Germany to the appearance of an endless number of books, pamphlets, periodicals, maps, etc. In the three cities of Leipzig, Berlin, and Stuttgart, nearly twenty-five hundred publications of the aforesaid description had appeared during the last six months of the year 1870.

Alexandre Dumas, Jr., denies, in the Italian papers, that his father left as large a number of novels and plays in manuscript as was reported after the death of the great romancer. He says that his father left only two unfinished novels and the outlines of a few plays.

Volumes three and four of Dixon's "Her Majesty's Tower," have been published in London; these issues bringing to a close the history of the celebrated Tower, "with its eight hundred years of historic life, its nineteen hundred years of traditional fame."

Mame & Co., the great Tours publishing-house, one of the most extensive book-concerns in Europe, suspended operations in October last, most of its workmen being enrolled in the army.

Hermann Grimm, the author of "Unconquerable Powers" and of the "Life of Michael Angelo," which was translated into seven languages, is a soldier in the Prussian Army, and was severely wounded in front of Amiens.

The average circulation of the daily papers which appeared in Paris during the siege, from the 1st of October, 1870, to the 1st of January, 1871, was less than fifty thousand copies.

The London School Board has virtually pledged itself to the admission of the principle of compulsory education, but has not yet entered upon a discussion of the details.

Robert Browning has contributed to the fund for the relief of distress in France, one hundred pounds, being the proceeds of a new poem.

The copyright of Eugene Sue's novels in

France is said to be worth very little or nothing, the demand for his books having entirely ceased.

Spielhagen, the German novelist, recently declined an offer to become managing editor of that excellent Vienna paper, the *Neue Freie Presse*.

A work on "The Newspaper Press, its Origin, Progress, and Present State," by Mr. James Grant, is announced in London.

M. Leroy-Dut, one of the founders of the *Revue des Deux Mondes*, died in December last, in Paris, in a garret, in a destitute condition.

It is reported that the Emperor Napoleon III. is actively engaged in writing his autobiography.

Jules Janin, the eminent French *feuilletoniste*, lives now at Brussels.

The title of Berthold Auerbach's next novel will be "A Son of the Black Forest."

Foreign Items.

AN expensive morning-visit was paid the other day to a wealthy Hebrew banker in the city of Vienna. The Princess Pauline de Metternich, who now lives at the capital of Austria, devotes her whole time and energy to collecting funds for the relief of the suffering French. Early one morning she sent one of her footmen with the list of contributions to M. O—, a wealthy banker, who at the time was yet in bed. The list is presented to the nabob on a silver tray. He looks at it and hands it back, yawning and saying: "Oh, if the princess herself had come, I should have subscribed five thousand florins." Early on the following morning the banker was awakened again, and a closely-veiled lady was ushered into his presence. She remove her veil, and the astonished banker saw that his fair visitress was no other than the Princess de Metternich. "You told my servant yesterday," she said to him, "you would subscribe five thousand florins if I would call on you myself. Here I am, and here is the list." There was no help for it. The banker had to subscribe the sum, and the princess left rejoicing.

The Continental papers are quarrelling over the question where Marshal Bazaine was born. According to the St. Petersburg *Gerichtsbote*, Bazaine is a Russian by birth, and probably a native of St. Petersburg. It is said that, in February, 1811, there was left at the door of M. Bazaine, a French officer of engineers who lived in St. Petersburg, a baby, which was adopted by M. Bazaine and his wife, who had no children. A German journalist, on the other hand, pretends to be able to prove that Marshal Bazaine was born in Hanover. His father, says the journalist, was military intendant in the city of Hanover, where he fell in love with a young lady. In spite of the opposition of her relatives, he married her, and a year afterward she bore him a son, the present Marshal Bazaine.

Victor Hugo was sixty-nine years old on the 26th of February. In former years he always celebrated the day with great *clat*, and a number of friends from a distance were always present at the banquet which the poet gave in the evening. This year, probably for the first time, the day, no doubt, passed off without a celebration.

The French Government has conferred the cross of the Legion of Honor upon M. San-

deau, the former law-partner of Napoleon's minister Billault, and whom the imperial government caused to be incarcerated for years in a lunatic asylum because he refused to surrender certain letters highly damaging to Billault's character.

Ex-King George V. of Hanover is said to be hopelessly insane. The poor man, it is reported, believes that he is not at his villa in Hietzing, near Vienna, but at the palace of his ancestors in Hanover. He often refuses to take food for days, and can be but rarely prevailed upon to take exercise in the open air.

When Alexandre Dumas died he owed his publishers, Michel Levy Frères, in Paris, upward of one hundred thousand francs. The publishers have informed the children of the novelist that they would not make any claim on the property left by their father.

King Victor Emmanuel is in feeble health. His physicians have recently earnestly urged him not to go any more so frequently on protracted hunting-excursions in the mountains, the hardships and privations of which his constitution is no longer able to bear.

The Crown Princess Victoria of Prussia has declared her readiness to devote two-thirds of her whole income during the years 1871 and 1872 to the relief of the widows and orphans of German soldiers killed during the war with France.

Shortly after the conclusion of peace, Victor Hugo and his two sons, Rochefort and Blanqui, will begin, in Paris, the publication of a large eight-page daily paper, with an evening edition of half that size. Its title will be *La République*.

Ex-Queen Isabella of Spain, who intended to purchase a chateau in the environs of Munich, has been politely informed that the Bavarian Government would prefer to have her take up her abode in some other country.

The Marquis de Galiffet, one of the favorites of the ex-Empress Eugénie, lives at present at Monaco, where he is reported to have lost his whole fortune at the public gaming-table.

The circulation of the *Indépendance Belge* increased so rapidly during the war that its stockholders received, on the 1st of January, a dividend of forty-two per cent.

Emile Ollivier, the ex-Premier of France, lives now in Switzerland, on the Lake of Geneva, and is engaged in writing a book on his career as a minister of Napoleon III.

While the German troops occupied Versailles, Edouard Laboulaye had to give board and lodging to from ten to fifteen Prussian soldiers.

The wealthiest landed proprietor in Alsace is a Jew named Lazarus Billigheimer. He is not yet sixty years old, and is worth four or five million francs.

The three Free Cities, Hamburg, Bremen, and Lübeck, have contributed to the German War Relief Fund a larger sum than was received from the United States.

The Queen of Prussia is said to be anxious that, after the conclusion of peace, her imperial and royal husband should abdicate in favor of "Our Fritz."

Jules Favre, the French minister, has steadily refused to receive any compensation from the public treasury ever since he became a member of the cabinet.

The superstitious people of Berlin feel a little uneasy at the reported reappearance of the famous "White Lady" at the royal palace.

St. Petersburg has five daily papers, with an aggregate circulation of sixty thousand copies.

Auguste Villemot, the famous *chroniqueur* of the Paris *Temps*, committed suicide in that city during the latter part of the siege.

Bismarck's second son, who was so severely wounded in the early part of the war, will remain a cripple for life.

The Emperor Napoleon III. is growing very near-sighted. He is no longer able to read or write without using very strong spectacles.

Fifteen new daily papers have made their appearance at Rome since the Eternal City was united with the kingdom of Italy.

The French Credit Mobilier is utterly insolvent, and the Pereire Brothers are reported to be bankrupt.

The widow of Prince Félix Salm-Salm intends to return to the United States.

Miscellany.

The Chinese in San Francisco.

BY REV. A. F. PEABODY, D. D.

THE Chinese form from a seventh to a fifth part of the entire population of San Francisco, and are seen in considerable numbers in all parts of California. They mingle with no other race; they learn or profess to know enough and only enough of the English tongue to transact their necessary business with their employers; and in San Francisco they live almost wholly in their own crowded quarters, which constitute in all respects a city by itself.

In the street they are the cleanest and neatest of people. Every man and boy has his *queue* of hair, as long as himself, nicely wrapped in silk braid, and generally rolled round the head. Their principal garment is a dark-blue, close-fitting frock. Their shoes are of silk or cloth, with felt soles.

Their houses are dirty beyond description. Scores and even hundreds of them are sometimes huddled together in the same building, with blankets for their only beds, and almost their only furniture. In these houses their simple cooking is performed in the long halls into which their apartments open, over furnaces, with no legitimate outlet for the coal-smoke, which leaves its black and greasy deposit half an inch thick on the ceiling and walls. I went into several of their fashionable restaurants, and found them hardly less filthy than their lodgings, yet with a marvellous variety of complicated and indescribable delicacies, which a year's income of the establishment might have tempted me to touch, but certainly not to taste.

Their provision shops contain little except pork, and that seldom in a form in which it would be recognized by an unpractised eye. Every part of the swine, even the coagulated blood, is utilized; and the modes in which the various portions of the beast are chopped, minced, wrapped in intestines, dried almost to petrification, commingled with nauseous seasonings, pique the curiosity as much as they offend the nostrils of the American observer.

Their theatres offer an amazing spectacle. Their performances commence early in the forenoon, and last till midnight. Their plays

are said to be historical, and they are often continued for several days. The scenery is simple, cheap, and gaudy, and is never changed. The costumes are splendid, with a vast amount of gilding and of costly materials, but inexpressibly grotesque, and many of the actors wear hideous masks. The orchestra consists of a *tontom* (which sounds as if a huge brass kettle were lustily beaten by iron drumsticks), and several of the shrillest of wind instruments. The noise they make may be music to a Chinese ear, but it consists wholly of the harshest discords, and each performer seems to be playing on his own account, and to be intent on making all the noise he can. This noise is uninterrupted, and the actors, who are all men (men playing the female parts in costume), shout their parts above the din in a falsetto recitative, monotonous till toward the close of a speech, but uniformly winding up with a long-drawn, many-quavered whine or howl. The performance is for the most part literally acting. A crowned king or queen is commonly on the stage, and almost always comes to grief. Parties of armed men meet on the stage, hold sham fights, kick each other over, and force the sovereign into the *mélée*. Then a rebel subject plants both his feet in the monarch's stomach, knocks him down, and himself falls backward in the very act. Thus the fight goes on, and gathers fury as its ranks are thinned, till at length the whole stage is covered with prostrate forms, which lie for a little while in the semblance of death, then pick themselves up, and scud off behind the scenes. The actors live in the theatre, though they might seem to have no living-room. I went into the principal theatre one morning, before the actors, who had been performing until a late hour, had risen; and I found them lying in one of the passage-ways in several tiers of holes, so nearly of the size of the human body that they could only have wormed themselves in feet first.

The Chinese exercise, with marvellous skill, all the mechanical arts and trades, and have as large a variety of shops as the Americans, with wonderfully rich assortments of goods, including works in wood-carving, ivory, and filigree, and can nowhere be surpassed in delicacy and beauty.

Their temples or joss-houses, are small upper rooms, with hideously-grinning idols, overlaid with tinsel, and covered with tawdry ornaments, on an elevated platform at the extremity of the apartment. Before these idols a dim lamp is always burning, and a table is spread for votive offerings, which are generally cups of tea or fruits.

These people are by no means unintelligent. It is said that there are none of them who cannot read, write, and cast accounts; and there are among them some men of high education, polished manners, large business, and friendly yet never intimate relations with their brother-merchants.

There is a mission-house, with a school and a chapel; but the missionary, an intelligent man and an indefatigable worker (by-the-way, my guide and mentor among the theatres and gambling-houses, in which he seemed very much at home, on the principle of becoming all things to all men), told me that he had gained a firm hold on very few; that he found it almost impossible to keep a small congregation together through a very short service, though many came in to listen for a little while; and that the slightest disturbance in the street, even the passing of a hand-organ, would empty instantly his chapel.

A Fight with a Bear.

"I was out with another man, prospectin' for gold in the woods. Somehow, we got apart

from each other. As I went along, I heard a quick step after me, and looked round, thinking it might be my mate coming up. It was a grizzly, running right at me, with his tongue out, and a kind of wicked look in his eye that I don't forget. I drew my six-shooter, and fired, by a sort of instinct, hardly knowing what I was about. We found out, afterward, that I had hit him; but he didn't seem much to care at the time. On he came, quickly as ever, and I took to my heels through the woods. As I ran, I could hear the brute panting behind me, nearer and nearer. I thought I was fairly 'gone up;' but the love of life made me run on, and it might have taken him some time to catch me, only I tripped over a log and fell flat on my face. In a second the bear had me fast by the leg. It was well I was on my face; or he'd just have scratched me open with his paw; for that's the way they like to begin. I declare to you, as he shook me and gnawed me, I remember swearing at the brute, just as if he was a man and understood. The pistol was still in my hand, and I put another bullet into him. He went on chawing at my leg. So I put a third bullet into him. He just chawed on. Then I remember thinking—though the thinking didn't take long, you may be sure—where I should have my last shot, before I fairly caved in. I chose a spot behind the ear, and gave him a fourth barrel. The brute fell over, stone dead; and I was able to get up. Presently, up came my friend, calling out—'Was that you firing?'—'Yes,' I said, 'that was me firing.'—'What at?'—'Why a grizzly nas had me down, and I've shot him.' My friend, seeing my leg bleeding, wanted to carry me off at once to the wagon; but I told him I wouldn't stir till I had that brute's skin; and—would you believe it?—we just sat down, took our knives out, and skinned the bear, before ever we moved from the spot.

English Adulterations.

We Londoners are poisoned in the water which we drink, poisoned in the gas with which we light our houses, we are poisoned in our bread, poisoned in our milk and butter, poisoned in our beer, poisoned in the remedies for which, when these horrible compounds have produced their consequences, we in our simplicity apply to our druggists, while the druggists are in turn cheated by the swindling rogues that supply their medicines. We have escaped, some of us, out of the hands of our grocers, for in despair we have set up establishments of our own. The grocers, we perceive, threaten us with actions for conspiring to defraud them of their honest gains. There was a time when drunkenness was as rare in England as it is now in France or Spain. Eighty millions a year are now spent among us upon wine, and spirits, and malt liquor, five-sixths of it perhaps by the working-men upon stuff called beer and gin. The artisan or the journeyman, exhausted by the gas-poisoned air with which his lungs are loaded, and shrinking, when his day's work is over, from the stifling chamber which is all that society can afford as lodging for him and his family, turns aside as he goes home to the pot-house or the gin-palace. His watered beer is raised to double strength again by nux-vomica and cocculus indicus, and salted to make his thirst insatiable. His gin is yet some viler mixture—a minimum of pure spirit seasoned with white vitriol and oil of cinnamon and cayenne. Drunk, and with empty pockets, he staggers home at last to his wife, who must feed and clothe herself and him and his miserable family with the few shillings which she can rescue out of his weekly wages. She, too, often enough, grows desperate, and takes to drinking also. The

result is, that half the children born in England die before they are five years old. The death-rate over the whole country is double the death-rate in Canada. And a minister of state rises in his place in Parliament and declares, amid general cheering, that the condition of the working-classes is supremely satisfactory, and that he holds convincing proof of it in the increasing returns from the excise!

Jim Bludso.

Wall, no! I can't tell whar he lives,
Because he don't live, you see;
Leastways, he's got out of the habit
Of livin' like you and me.
Whar have you been for the last three year,
That you haven't heard folks tell
How Jimmy Bludso passed in his checks,
The night of the Prairie Belle?

He weren't no saint—they engineers
Is all pretty much alike—
One wife in Natchez-under-the-Hill,
And another one here, in Pike.
A keersless man in his talk was Jim,
And an awkward man in a row;
But he never flunked, and he never lied—
I reckon he never knowed how.

And this was all the religion he had—
To treat his engine well;
Never be passed on the river;
To mind the pilot's bell;
And, if ever the Prairie Belle took fire,
A thousand times he swore,
He'd hold her nozzle agin the bank
Till the last soul got ashore.

All boats has their day on the Mississipp,
And her day come at last:
The Movastar was a better boat,
But the Belle, she *wouldn't* be passed;
And so she come tearin' along that night—
The oldest craft on the line—
With a nigger squat on her safety-valve,
And her furnace crammed with rosin and pine.

The fire bust out as she clared the bar,
And burnt a hole in the night,
And quick as a flash she turned, and made
For that willer-bank on the right.
There was running and cursing, but Jim yelled
out,
Over all the infernal roar:
"I'll hold her nozzle agin the bank
Till the last galoot's ashore!"

Through the hot, black breath of the burnin'
boat,

Jim Bludso's voice was heard,
And they all had trust in his cussedness,
And knowed he would keep his word.
And, sure's you're born, they all got off
Afore the smoke-stacks fell—
And Bludso's ghost went up alone
In the smoke of the Prairie Belle.

He weren't no saint—but at judgment
I'd run my chance with Jim,
'Longside of some pious gentlemen
That wouldn't shook hands with him.
He seen his duty, a dead sure thing,
And went for it thar and then;
And Christ ain't a goin' to be too hard
On a man that died for men.

The Emperor of Germany.

The history of this venerable old title affords, no doubt, strong and singular evidence of the durability of ancient impressions of superstitious loyalty. A philosopher may think as he pleases of a title, but the owner of it possesses a power in the world which even the philosopher cannot afford to ignore. The Roman military name of emperor passed to the

sovereigns of the Roman world; its honor was divided, A. D. 395, between the Emperors of the East and West; died out in the West in 475; was renewed by Charlemagne in 800. But then, and for centuries after, it implied some sort of imaginary divine right of government over Western Christendom in general—a Christian caliphate, so to speak. And for seven centuries no German emperor was so styled until he had been crowned in, or at least visited, Rome. The successors of Charlemagne and Otho, says Gibbon, "were content with the humble names of Kings of Germany and Italy till they had passed the Alps and the Apennines to seek their imperial crown on the banks of the Tiber." Maximilian I., Mr. Carlyle's favorite "White King," was the first to break through this venerable usage in 1493, styling himself "Roman Emperor elect," and thereby to dissolve the imaginary connection between temporal and spiritual. Charles V., his son, reverted to the old practice; but with him it ended. Ever since his time even the antiquarian connection between Germany and Rome has ceased. And it is remarkable, as bearing on present contingencies, that, although by old recognized usage certain special characteristics are required in the personage who aspires to the dignity, he must be a Frank or a German by descent, of noble birth, eighteen years of age, a layman, and, according to the Golden Bull, a "righteous, good, and disinterested man;" there is no prescription to which confession he should belong. Ever since the Peace of Westphalia the electors might lawfully have chosen a Protestant; but the ceremonies to be observed at the coronation evidently imply that the recipient of the honor belongs to the Church of Rome. There is certainly something of an anachronism and an anomaly to enthusiastic minds of antiquarian tastes in the idea of a Protestant Emperor of Germany; though why more so than in that of Protestant abbots and abbesses, canons and canonesses, all of whom have existed in Goethe's "many-colored" old empire, it would be difficult to say.

A New Anecdote of the Revolution.

When Washington determined to cross the Delaware and surprise the Hessians at Trenton, his plans were discovered in some way by a Tory family living on the Pennsylvania side. A young man of this family was dispatched across the river to warn the Hessian commander, Colonel Rahl. He reached Trenton in safety, and, going to Colonel Rahl's headquarters, asked for an interview. This was refused by the sentry at the door, who said that the colonel could not be disturbed, that he was particularly engaged. After several ineffectual efforts to obtain an audience, the young man went away, leaving a note, with the request that it should be given to Rahl immediately. This note contained the information that Washington would cross the river that very night. It was carried to the colonel, who was engrossed by a game of chess. Hearing that it had been left by a young man, and apprehending no danger, he put it into his pocket, and went on with the game. Before morning light he was roused by the fierce attack of the Americans, who drove in his pickets, and came suddenly upon the main body of the bewildered Hessians, who fled in all directions. Colonel Rahl mounted his horse, gallantly but vainly endeavored to rally his disordered troops, and, as he rode back toward Trenton, after going some distance into the country, he was mortally wounded by a musket-ball. He fell from his horse, was carried into a house (still pointed out), and died. In his pocket, after death, was found *unopened* the very note

the young man had left for him the night before. So the story runs.

The New King of Spain.

A letter from Madrid, of January 7th, says: "The young king is winning the hearts of all by his simplicity, generosity, and good-nature. On Monday he took possession of his palace. On Tuesday he sent away all the cannon in front of it, and all the guards inside except fifty. The dinner-carte of twenty-four dishes he has cut down to four, and he has shut up half the apartments in the palace destined for the use of the royal family. He refuses to be driven with more than two horses, or with more accompaniment than an outrider in front and a lackey behind, with but one or two of his adjutants inside with him. Fearfully cold as it has been, he insists on an open carriage. He rises early. The first morning he called for his breakfast at seven. It was not ready. The mayordomo told him they had not expected his majesty would breakfast till eleven or twelve. Off goes the king, with one adjutant, to the Hôtel de Paris, and breakfasts there! He orders the palace-gates to be locked and the lights put out at midnight. He himself, so far, has retired to rest soon after ten. These un-royal habits, or, I may better say, un-Spanish habits (for here the natives breakfast at eleven, and go to bed when the cock crows), are creating great astonishment. He has had one or two receptions of officials, at which he has abolished the hand-kissing of royalty for the hand-shaking of democracy. He yesterday gave one thousand pounds to the poor of Madrid, and another thousand pounds to the needy among the citizen militia. He is soon to hold a review of the troops, and insists on reviewing the militia also. He walks about the streets, goes visiting and shopping without any escort, and accompanied by only one or two adjutants. . . . Learning that the public school-masters are many months behindhand in their pay, he has told Minister Moret he will touch none of *his* pay till their claims are satisfied."

Cruikshank and Dickens.

An American in England, who had laid a wager that Cruikshank had illustrated six of Dickens's works, wrote to the artist, and received the following answer:

303 HAMPESTEAD ROAD, N. W. (LONDON),
November 12, 1870.

DEAR SIR: You have lost your wager, for I did not illustrate the works of the late Mr. Charles Dickens to the extent that most people suppose; but I am not surprised at the fact of their being misled, for the other artists employed upon his works imitated my style as closely as possible, and hence the public supposed—as Dickens wrote under the name of "Boz"—that I designed and etched under the name of "Phiz," but who was a very clever artist of the name of Hablot K. Browne. I was, however, the first artist to illustrate any of Mr. Dickens's writings, and the earliest of these was the first volume of "Sketches by Boz" (January, 1836), and the next was the second volume under this title, the greater part of which was written from my hints and suggestions. Some time after this, Mr. Bentley started his *Miscellany*, appointing Mr. Dickens as editor, and myself as illustrator; and the first plate in that work is a design of mine, which Mr. Dickens wrote up to. There was also a woodcut of a beadle, etc. Then followed (1839) "Oliver Twist," which was entirely my own idea and suggestion, and all the characters are mine. And this will account for the fact of "Oliver Twist" being very different from

any of his other writings. When Mr. McCrone, the publisher, died (he having published the "Sketches by Boz"), a volume was brought out for the benefit of his widow. Mr. Dickens wrote some part of this, which I illustrated—and these are all the designs and etchings that I did to illustrate the works of that author. I am preparing to publish an explanation of the reason why I did not illustrate the whole of Mr. Dickens's writings, and this explanation will not at all redound to his credit. With respect to the American editions of Mr. Dickens's works, there may be copies of some of my designs therein, but none by the hand of, dear sir, yours truly,

GEORGE CRUIKSHANK.

Ruloff.

That a high development of the intellect is compatible with unspeakable corruption of heart, is well exemplified in the case of Edward H. Ruloff, the murderer. It is often assumed that, if men devote themselves to science and the higher departments of literature, it is sufficient evidence that they are actuated by sound moral principles, and incapable of great crimes. Ruloff understands this, and points triumphantly to the fact that no small portion of his life has been spent in scientific pursuits. At his recent trial he referred to his work on the origin of language, and asked if it was probable that a man engaged in such pursuits could be a burglar and a murderer. An artist of no mean skill, the master of six or seven languages, an author, versed in legal lore, he would pass in any ordinary society as an intelligent, highly-educated man. And yet the evidence appears conclusive that his life has been filled with the darkest deeds; that he has associated with robbers and cut-throats, plotting crimes for them to execute; that, after living with his wife for two years, he murdered her and her infant daughter, and sunk their bodies in the waters of Cayuga Lake; and that he recently murdered a clerk who was guarding his employer's property—that he is, in short, another Eugene Aram. It had been the firm conviction of many persons for years that he was supremely wicked; but his education and accomplishments shielded him. With all the evidences of his guilt before us, it is difficult to believe that a man who has devoted so many years to intellectual studies, and is so absorbed in them that while confronting death he pursues them, and weeps only at the thought that he may have to leave unfinished a literary work on which he is engaged, has been guilty of the crimes charged against him.

Cigars and Beards.

It took a long time to establish free trade in tobacco and hair among the habits of English society. A cigar and a beard, a few years back, were considered indications of skeptical views and socialistic tendencies. Few men were to be seen smoking in public; and one only in London had the courage to defy the multitude by wearing a beard. He was then member for a manufacturing constituency. He did not live to see the change which occurred a few years later. The beard, which had subjected him to so much abuse, cropped out in the army, the navy, and the civil population. It was suddenly discovered to be convenient and ornamental; and the faculty pronounced it to be a natural respirator.

The baker wore it to exclude the flour from his lungs; the railway-guard to keep off the biting wind; the dandy to acquire manly beauty; and the gentleman with a mouth like the orifice of a carpet-bag, garnished with a double row of piano-forte keys, resorted to a beard to hide the sharps and flats from the public eye.

The bar made a move; but it was repressed by the stern attitude of the judges. False hair on the head might be necessary, but real hair on the chin was too bad.

The churchmen were bolder and more successful. They remembered that, though Joseph shaved, tradition has led to the belief that other Scriptural characters did not. Thus encouraged, they dared to brave the frowns of the bishops; and long beards now wag from many a British pulpit.

There was a fall in the value of razors; and an American gentleman of that day, stroking a long fringe that covered his throat, was heard to remark that "shaving is labor without wages, and that the material you cut off is of no value in the market."

How to get the Men to Church.

"My dear parson, I am delighted with your sentiments," said the professor, confidentially, as they walked together into the smoking-room. "They have given me so much pleasure that, in return, I must communicate to you an important secret. It's a scheme I have long entertained for setting the Church of England on its legs again."

"Sir!" ejaculated the divine, indignantly. "It can stand perfectly well without your help, I do assure you. The religious census returns—"

"My good sir," interrupted the professor, "that counts the ladies. There is no doubt whatever that a great number of females do attend the services of the Church; but, unhappily, if you glance round you, even from your own pulpit, you see many more bonnets than bare heads. Come, confess it. The men don't come as they should do."

"Well, then—for argument's sake—they don't."

"Just so. Now, I've a plan to make them."

"Some new-fangled absurdity of yours, professor, I'm afraid."

"Not at all, my dear sir. I propose to revive an old and revered custom, which is spoken of by Sir Walter Scott as being in use in some of the out-of-the-way kirks in Scotland—those, I suppose, 'above the pass.' If you will only adopt it, I promise you would get nine male hearers where you now get one. It's nothing wrong, as you think; it's something we are just about to do ourselves." Here the professor dropped his voice to a stage-whisper—"Let 'em smoke!"

Condition of England.

When the last shot had been fired at Waterloo, Great Britain was indisputably the first power in the world. From that day to this we have run a career, almost without a check, of what has been called unexampled prosperity. Yet at the end of these fifty-five years English officers tell us that they can scarcely show their faces at the *table d'hôte* in Germany without danger of affront. English opinion is without weight. English power is ridiculed. Our influence in the councils of Europe is a thing of the past. We are told, half officially, that it is time for us to withdraw altogether from the concerns of the Continent; while on the other side of the Atlantic Mr. Emerson calmly intimates to an approving audience that the time is not far off when the Union must throw its protecting shield over us in our forlorn decrepitude. We are still able to make ourselves hated; we cannot save ourselves from being despised; and, however we may resent the attitude which the world is assuming toward us, we are painfully aware that we owe our exemption from immediate danger to our geographical position alone, and that, if our fleet were

accidentally disabled, and a well-appointed army of a hundred thousand men were thrown upon our shores, we could offer no effective resistance.—*J. A. Froude.*

Mr. Robert Buchanan's new poem, "Napoleon Fallen," closes with a chorus, or epode, giving a lyrical description of the millennium. It is interesting to observe that he is sound on the woman-question; although rather perplexing to be told in one stanza that there are to be marts, and in the other that there shall be neither buying nor selling in the New Jerusalem:

"In the fair city then,
Shall walk white-robed men,
Washed in the river of peace that watereth it;
Woman with man shall meet
Freely in mart and street,
At the great council-board woman with man shall sit.

"Hunger and thirst and sin
Shall never pass therein;
Fed with pure dews of love, children shall grow;
Naught shall be bought and sold,
Naught shall be given for gold,
All shall be bright as day, all shall be white as snow."

Varieties.

THE most beautiful girl in the United States lives near Lincoln, Ill. Her hair is of that particular hue that a field of ripe wheat throws toward the setting sun. Her eyes send forth a light so effulgent and magnetic, that strangers become spellbound under its influence, and stand rudely gazing. Her cheeks bear a bloom like the sunny side of an early peach. A pearl would seem almost black beside her teeth. Her form is so graceful that men worship her before seeing her face. Her hands suggest the idea of waxen fingers tipped with vermillion. Her smile seems actually to illuminate her presence; and when she laughs, the listener fancies he hears sweet music in the distance.

An Iclander, referring to the fact that the singing of swans has long been asserted by naturalists to be a vulgar error, writes to *Nature* to say that these birds actually do sing, and that he has heard them. In a shallow frith on the west coast of Iceland, near which he lived for nine years, hundreds of swans gather during the summer months, and he asserts that in the morning their singing is so loud that it can be heard miles away, and the mountains on both sides ring with the echo of it; and it does not at all resemble the cackling of geese, or the quacking of ducks.

A romantic story comes from the African diamond-fields. A sweet-looking Koranna girl went to a young Englishman's claim and began hunting for diamonds. He was too gullible to drive away a girl, and, when she picked up a gem, he promptly offered his hand in marriage, and vows he will introduce his wife to his gentle English family as an African princess.

The curious fact that a needle or other steel wire inserted in a living body will immediately become oxidized, while, if the body be dead, no oxidation will take place, was recently brought to light by Dr. Laborde, of Paris. This is a simple test as to whether death has taken place, and will be available in cases of trance or catalepsy.

A Moravian missionary, after forty years' work in Greenland, reports: "In all Greenland there is but one station in the neighborhood of which there are heathen. With this exception, all the Greenlanders now profess Christianity." What shall we do with the popular missionary hymn, "From Greenland's icy mountains?"

The completest pun in the records of literature is produced in the following words, which were inscribed on a tea-chest: "*Tu doces*," which is the second person singular, present tense of the Latin verb *docere*, I teach; and when literally translated, becomes "Thou tea-chest."

When any one was speaking ill of another in the presence of Peter the Great, he at first listened to him attentively, and then interrupted him. "Is there not," said he, "a fair side also to the character of the person of whom you are speaking? Come, tell me what good qualities you have remarked about him."

They are exhibiting a panorama of New-York City in the South which gives a view of more than ten thousand horses and carriages and upward of one hundred thousand of its people, seven and a half miles of shipping and steamers, processions, military companies, bands of music, etc.

Out West they tell a story about a dog which was greatly interested in music. He attended a singing-school, and was subsequently found in the back-yard with a music-book in front of him, beating time with his tail on a tin-pan, and howling "Old Hundred." A fact for Darwin.

A striking illustration of the saying, "The pith of a lady's letter is in the postscript," was that of a young lady, who, having gone out to India, and, writing home to her friends, concluded with the following words: "P. S. You will see by my signature that I am married."

The only chapter in the Bible (the last chapter of Proverbs) written by a woman (the mother of King Lemuel) contains a plea for woman's wages: "Give her the fruit of her hand, and let her own works praise her in the gates."

A wonderful brick-machine has been devised by a French prisoner in Magdeburg, since his confinement there. Before the war, he was a poor day-laborer; but he has sold his invention to a German firm for fifteen thousand thalers.

A Virginia paper cites as a remarkable instance of the efficacy of abstaining from medicine a lady in that State who has reached the age of ninety-six, and throughout all the long years of her life has taken but three pills, and has buried three husbands.

It is said that the reason why the Russian Government is so slow in availing itself of the advantages of the electric telegraph is that they object to one of the important preliminary arrangements, namely—the elevation of the Poles.

There is a paper printed in the Cherokee Nation in the "native dialect." An Arkansas editor says: "It is the worst specimen of pickled tongue we ever saw. It looks as though a nitro-glycerine explosion had occurred in a type-foundry."

A court, in Michigan, has decided that a physician is not warrantor or insurer of a case, and he is not to be tried for the result of his remedies. His only contract and duty is to treat the case with reasonable diligence and skill.

Military men have discovered a new remedy for intoxication. It is nothing more than raw potatoes cut up into slices, and eaten without salt. An ordinary "murphy," it is said, will cure the most obstinate case in half an hour.

It is a curious fact that most of the great musical composers have been childless. Handel, Haydn, Beethoven, Corelli, Pergolesi, Rossini, Spontini, Auber, Wagner, and Schumann, are among the instances.

A Frenchman is content with one-sixth of a pound of animal food per day, an Englishman consumes not less than half a pound, and an American demands from half a pound to a pound.

George Eliot hints that the rustic practice of chewing the end of a straw may be some faint reminiscence of the time when the human animal was graminivorous.

There is a Serbian prince in the Prussian army whose name is so long, that a company of engineers have been ordered to level down the consonants and use it as a pontoon-bridge.

Bacchus has drowned more men than Neptune. The meaning of this proverb appears to be this—that it is much safer to go over the seas than to get half-seas over.

A young lady wrote some verses for a country weekly about her birthday, and headed them "May 30th." It almost made her hair gray, when it appeared in print "My 30th."

A Boston lecturer says he lived next door to Hawthorne for four years, and saw him only twice in all that time. Hawthorne always was rather lucky.

Rochester calls itself the "Flour City," or the "Flower City," just as it chooses, for it is unequalled in the country both for the extent of its mills and its nurseries.

It is said that in Belgium the butchers habitually use laurel-oil on the door-posts and windows, with great success, for the purpose of keeping away flies.

A chap who was told by a clergyman to "remember Lot's wife," replied that he had trouble enough with his own, without remembering other men's wives.

Nurse: "I cannot allow butter and jam, too, on your bread, Master Alfred. It is very extravagant."

Master Alfred: "It can't be extravagant, Mary, if the same piece of bread does for both."

In Canada all women, whether maids, wives, or widows, who pay taxes in their own right, are entitled by law to vote for school-inspectors.

When Oscar Hayes, an old body-servant of ex-President Polk, died not long ago in Columbia, Tennessee, the town was draped in mourning.

About one hundred persons in New-York City profess the faith of the "Orthodox Greek" Church.

A poem in an agricultural paper, called "Song of the Farmer Boy," very appropriately commences with "Ho! brothers, ho!"

A catalogue of eighteen hundred and twenty-three works on the occult sciences has been printed at Moscow.

The Zoological Garden, in Florence, has just had the first success in Europe in breeding ostriches.

Rain is annually becoming more frequent in Egypt, in consequence of an extensive increase in the cultivation of the palm there.

The asphalt pavements in Paris, during the siege, were, it is stated, exclusively used for fuel in the chocolate-factories.

A Chicago girl says she does not get married for the reason that she does not know whose husband she might be marrying.

A great financial reformer is so devoted to figures that when he has nothing else to do he casts up his eyes.

A Richmond writer advocates charging an admission fee to church service, instead of selling pews yearly.

What Columbus did—a notion crossed him and he crossed an ocean.

If a woman were to change her sex, she would be a he-then.

A little girl wanted her father to go to the loafer's and get a loaf of bread.

The worst kind of education—to be brought up by a policeman.

Common suers—lawyers.

London has ten thousand attorneys.

The Museum.

THE Nicobar Islands lie thirty miles south of the Andaman group, in the Bay of Bengal, and consist of nine tolerably large islands. They are very fertile, and the natives are a fine, tall race, copper-colored, and very much superior to the Mincopies of the Andaman Islands. The men are peculiarly large about the breasts, at a distance resembling women; they wear their hair

long, parted in the middle, and have no beards. They have one striking peculiarity of dress. In lieu of clothes, the men wear a strip of cloth, never more than two inches wide. This is passed round the waist, under the legs in front, and tucked through itself behind, the end being left as long as possible. They place great value on the length of this appendage, and he is the best-dressed man who wears it the longest; some of the wealthy among them wearing it dragging along the ground for several feet, like a European lady's train. The women do not wear pendants like the men, but have a plaited grass girdle. The character of the Nicobarians is very gentle; they are usually agreeable and hospitable when they suppose no harm is intended. The native weapons of the Nicobarians are very curious. As the people are not of a warlike character, their weapons are used almost exclusively for killing game. The most formidable is a tolerably large spear, headed with iron, which is used for killing hogs, and is thrown like the *assa-gai* of Southern Africa. They have also a smaller javelin for fish-killing, and a number of many-pointed hand-spears for the same purpose. The most remarkable of their weapons is a cross-bow; it is not very powerful, and only propels a small arrow. Its chief use is in killing birds. Besides these weapons, every man carries a cutlass-blade

from which the hilt has been removed, and a handle roughly made by wrapping some six inches of the butt with cocoa-nut fibre. It is intended not so much as a weapon as a tool, and with it the natives cut down trees, carve their canoes, and perform similar operations.

The architecture of the Nicobarians is sin-

gular. The native architect begins by fixing a number of posts in the ground, and erecting on them a platform of split bamboo. Over this platform he builds a roof shaped exactly like a beehive, and his house is then complete. The bamboo platform is the floor of the hut, and, being elastic as well as firm, serves also for a

bed. To this hut the native ascends by a primitive sort of ladder, and passes into the chamber through a hole cut in the floor. The huts are kept peculiarly neat and clean. The open space between the floor and the ground is far too valuable not to be utilized, as it affords a cool and airy shelter from the sunbeams. Under this floor is suspended a primitive sort of hammock, which is a board about six feet in length, slung by ropes. In, or rather on, this very uncomfortable hammock the Nicobarian likes to lounge away his time, dozing throughout the hot hours of the day, sipping palm-wine at intervals, and smoking without cessation. The canoes of the Nicobarians are hollowed out of the trunks of trees, and supported by a slight outrigger. They have a very high and ornamental prow, and are propelled by short paddles. They are very light, and, when properly manned, skim over the water at an astonishing pace. Some of them are nearly sixty feet in length, while others are barely six or seven feet long, and only intended for one person.

A Scene in the Nicobar Islands.

ANNOUNCEMENT.

PICTURESQUE AMERICA.

The publishers of APPLETONS' JOURNAL have the pleasure of announcing the completion of arrangements by which Mr. HARRY FENN will for a time give his professional services exclusively to the prosecution of the series of views entitled "PICTURESQUE AMERICA," which for a few months past has been a conspicuous and attractive feature in the JOURNAL. Mr. Fenn will this spring visit SOUTH CAROLINA, GEORGIA, TENNESSEE, and VIRGINIA, after which he will proceed to sections North and West; and, when the summer heats are over, he will visit other Southern localities. It is the design to illustrate every portion of the Union, in a manner far superior to any thing of the kind hitherto attempted, so that in time the series will present a splendid and complete gallery of American landscapes and places. Mr. Fenn, whose vivid and graphic pencil has placed him at the acknowledged head of American draughtsmen, will for the present give his professional labors solely to the pages of APPLETONS' JOURNAL.

APPLETONS' JOURNAL

WITH SUPPLEMENT.

A SCENE AT THE ATLANTIC DOCKS BROOKLYN.

THE ATLANTIC DOCKS.

ONE of the most interesting and useful, and, at the same time, one of the least known to the public, of the institutions about New York, is that which is known as the Atlantic Docks in Brooklyn.

Here were vast expanses of useless flats, unwholesome, sickly, unsightly, and in the way, in 1841; and here is now the greatest grain depot in the country.

Where was once a nuisance, a malarious swamp, is now the depositing end of the Erie Canal, the lap into which is poured the year's work of the Northwest.

Before, it was desolate; now, it is beautiful, for ships and cargoes can never be otherwise.

Years ago the place was mud, and was hateful to the eye; now it is a dock of forty acres, and surrounded with twenty acres of stores, built of brick and stone, and generally five stories in height.

It is a rectangle, a court-yard from the sea, and opens upon the channel by a passage two hundred feet in width.

The piers are built of crib-work, filled in with the excavated earth, and the walls of the heavy stores are laid upon it. On the inside are two other piers projecting into the dock on either side, and built in the form of tuning-forks.

All is concealed from the sailor on the river by the outer rows of stores which stand on the westward side, but, when once within, the aspect is grand and exciting.

Endeavor to see it in October. It is then that the grain carnival is at its height. The place is in a fever, in a glow, from the highest rafters of the lofts to the ground beneath your feet, which shivers with the tremor of the machinery. It will be crowded with ships loading for the Eastern world, and with canal-boats unloading, while on the outside will be heard the piercing whistles of the tug-boats, bringing flocks of ungainly hulks in their wakes, filled to their deck-beams with corn, in a hurry to be emptied.

There are eleven elevators—eleven huge, oblong, upright boxes thirty feet square, two of which resemble coffins of giants. One of them is slate-colored, and overhangs the cart-way like a useful Temple Bar. Another is green, with a slanting roof and bulging sides, and looks ancient and Dutch-like, with a breadth of Amsterdam in its general appearance.*

They hold the machinery for taking the grain from the boats below, for clearing it, and for distributing it, five hundred feet away if necessary. They rise twenty and forty feet above the storehouses, and are monsters of activity and strength.

They have chambers and stairways all through them, are pierced and hung with revolving shafts, and diabolical wheels with cogs. Immense bands of rubber and leather stretch up and down, and the floors yawn into sieves polished and worn with friction, and the atmosphere is filled with dust.

Upon the outer side of each, that is, the one fronting the water, there is a pair of wooden tubes joined at the top and bottom, and which contains a band fitted with tin gutters placed horizontally. The band passes about wheels at either end of the tubes, and the gutters project outward like scales upon an armor suit.

The band passes over revolving wheels, and they and it are boxed in tightly. The wooden tubes are movable, can be let down or pulled up, or pushed in or out.

Much of the grain which comes must be cleansed, for it is thickly sprinkled with fragments of the cobs, husks, and earth. It must come up from the water-level, seventy feet.

Boats with open hatches are seized by the tugs and thrust beneath the elevators; they contain eight thousand bushels of grain. The tubes of wood are thrust into them; a roar and quaking ensues, and in three hours they are sucked dry. Not a pint of kernels remains.

The flood of gold has mounted to the required height like a cloud of steam—it has fallen down again, and, being pure, is again thrust up into long passages which contain revolving iron serpents, which screw the corn a hundred feet on over the roofs of the stores, and then a hundred feet to the right or the left, until the tortured and smoking river finds an open shunting leading slantingly downward. Into this it rushes and falls into a vast, deep, black, heavily-timbered bin, and there it stays until called for.

All the eleven monsters may be doing this at once; not only all

* See the engraving on preceding page.

day, but all the livelong night. Hundreds of boats may be waiting their turns, more hundreds besieging the river-passage, and hundreds more still may be ploughing their hulking ways amid the steamers and ships of the harbor hurrying to disgorge.

Seventy thousand bushels in the twenty-four hours may pass from sea to land through the purgatory of sieves, and into their chambers. Multiply the rack, tumult, and dust, of this one transaction by that of a dozen more, and you have a busy day. Listen to the screaming of steam-whistles; the churning of waters under the spiteful kicks of the tow-boats; the metallic grind of machinery; the hollow, reverberating pour, pour, pour, of the volumes of grain from all heights: witness the clouds of dust which burst from every port-hole, crack, and crevice, and settle heavily down; the black smoke from craters of chimneys; the maelstrom of ships whirling round and round; the casting off and gathering in of hawsers; the violent laboring of red-faced men: feel the shiver of the ground; the ceaseless jar of precipitated tons of grain—and you will have gained the idea of a great struggle, a battle, a fight rather with a nightmare than with an enemy in the open field.

The place is stuffed with plenty besides grain. Every thing that may be hoarded against a market finds a secretion here.

The locality has long periods of somnolence. It gets filled, and it goes to sleep, like a boa-constrictor or a drunken man. It is rich, plethoric, overlaid, heavy.

Hulks from India, from the South, from the China Seas, float lazily up to its wharves, and empty themselves into its capacious lofts, and then go off for more.

It represents the abstract idea of commerce and merchandise. It seems to be a fit place for the education of old-fashioned, highly-respectable martinetes of the most uncompromising schools of business; stiff-necked old parties with seals and neckcloths, to whom failure was ruin, and who began and would have others begin with making the office-fires.

It is a singularity; it is an ideal of wealth; it is among the first of its class in the world. It is enterprising, keenly alive to the manner in which it may improve; it refines upon the economy of handling the property which comes under its influence; and, as a laborer, broker, merchant, keeper, collector, and disperser, it is immaculate.

Its property is fabulous. It is a head, a spring, a spirit, in the doings of the world. It is an exhilarating work to walk in the midst of its treasures, to breathe the strange odors, and see the unusual products in limitless stores. Five million bushels of grain have floated upon its forty acres of water at one time. There have been one hundred and thirty square-rigged ships within its walls, and other craft without number, also at one time. At such moments it resembles a wooden park with forests of trees arising from it, denuded of verdure, but covered with the work of enormous spiders.

It is a place truly worth seeing. Neither Liverpool nor London has its equal, for vessels float in and out at all tides, and gates are needless. Still, scarcely any one in New York knows any thing about it, though there is no sight in the city, or in its neighborhood, more impressive or more characteristic.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER V.—AFTER TWENTY YEARS.

HALF an hour later, Mrs. Annesley's footman was unfastening a large, rusty iron-gate, and holding it open while the flashing carriage rolled majestically through. Then he let the wings fall together with a loud clang, and Mrs. Annesley felt that she was within the domain of Morton House.

It was rather a dreary-looking place into which she had entered; and none the less dreary because showing evident signs of much by-gone beauty and care—dreary with a forsaken air of neglect under the soft November sky, and with the mellow glory of the November sunshine streaming upon it. In all Indian-summer weather, there is a pathos of intangible sadness—even on the bright road, and under its glorious golden woods this was sensibly to be felt; but here

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

it deepened into something almost approaching pain, something which even a nature as wholly prosaic as Mrs. Annesley's could not but feel. "One might believe it was a graveyard," she thought to herself, as her eye swept over the broad, park-like extent around her. A sudden break in the closely-planted trees of the avenue spread a fair picture before her eyes—a picture fair in its decay. True, the noble lawn was thickly strewn with the fallen and mouldering leaves of many autumns, and the once magnificent shrubbery, which on the south side stretched away into far-reaching gardens, was now little more than an overgrown wilderness. But there was an almost regal air of space spread over all; and even neglect could not entirely destroy the matchless landscape gardening that had once been displayed here—the artistic grouping of trees and shrubs, the forest vistas, and the enchanting vicissitudes of light and shadow so skilfully blent and arranged. The avenue was at least a mile in length, and led almost directly to a broad, green terrace, which extended around the house, and from which stone steps descended to the drive below. The house itself was now in sight—old, large, brown, and weather-beaten. Yet notwithstanding all the dreariness of falling shutters and rotting roof, there was something about it which made it not difficult to believe that it had once been the gayest and most hospitable dwelling in the county—a something which had survived all the long twenty years when no feet had crossed its threshold save those of the servants, who once every six months opened the windows and let God's sunshine stream for a brief space into the darkened chambers!—the twenty years when no household-fires had blazed on the cold hearths, when no master's voice or mistress's laughter, or children's merry tones, had sounded along its galleries, or broken the silence of its deserted rooms.

"There only need a few repairs to make it again the most beautiful place in all the county," Mrs. Annesley said to herself, as she leaned forward for a better view of the house, which she was now rapidly approaching—the house that had sheltered her childhood and youth, and from which her husband had taken her a bride. And, as she bent forward in the bright sunshine, and looked at the dark old front, with its lofty stone portico, a sudden vision seemed to rise before her—a vision of a royal-looking girl, with a face that was brilliant as an oleander blossom, with hair that seemed to have caught the sunshine on every thread, with eyes of matchless splendor, with the profile of a Greek cameo, and the bearing of a Greek goddess. She saw this lovely vision standing where Pauline Morton so often had stood, just within the shadow of the arched door-way, wearing the fresh-flowing muslin that Pauline Morton so often had worn, and turning as if to greet her with the winning smile she had seen so often on Pauline Morton's lip. It was only a moment that this picture of the past stood framed there; but so vivid was it that Mrs. Annesley almost seemed to look through the open doors behind, and see the sunshine of long ago falling on the tessellated floor of the wide, cool hall—almost seemed to see the servants passing up and down the broad staircase, the gay faces at the drawing-room windows, and all the life, the stir, the bustle, so long since fled forever. It was only for one moment; the next, the yellow sunshine slept as peacefully as before on the closed door and vacant step.

But the past had not come back in vain even to this woman's selfish heart, and, for a few minutes, she wavered in the purpose which had brought her there. For a few minutes, she remembered how long that roof had sheltered her, how constant had been the kindness, how lavish the generosity she had received there; she remembered the dead who had befriended her, and, for once, the ingratitude she was meditating rose up to reproach her. Then her son's handsome face and gallant presence seemed also to appear on that threshold where she had so long hoped to see him master; and the mother's heart steeled itself again. "It is for him," she murmured; "and I should not hesitate at any thing, however painful, to serve his interest. Besides, it will depend upon herself—that is the only light in which to look at it. It will depend upon herself; and any one else in my place would act as I must do."

As if to give emphasis to her concluding words, the carriage at that moment drew up before the terrace-steps, and the footman was on the ground lowering the steps, and ready to guard his mistress's dress from any contact with the dusty wheels. It was too late to retreat, even if Mrs. Annesley had felt inclined for any thing so recreant. But she alighted at once; ascended the steps and crossed the terrace, her ample skirts sweeping grandly over the neglected; walks entered

the portico, and, finding the door-bell gone, gave a summons with her parasol on the panel. She was forced to repeat it more than once before the door opened, creaking a sullen protest on its rusty hinges, and a gray-haired servant appeared. He looked a little doubtfully at the lady standing before him, shading his eyes with one hand, for the sunlight streamed full in his face; but she smiled at once in cordial recognition.

"Why, Harrison, is it you?" she said. "And so you are back in the old place. How are you?"

"Oh, it's Miss Elinor! I beg your pardon, ma'am, but I didn't know you at first," the old man answered, as he took the delicately-gloved hand she extended, in the momentary clasp of his horny black one. "Yes'm, I'm back. Miss Pauline said as how she would rather see the old faces about her than any new ones, Miss Elinor."

Miss Elinor! Yes, she was "Miss Elinor" yet, to these old servants of her uncle's household; and, although she often met them, and heard the name, it had never brought back the memory of her youth as it did now, when she was standing at the door of Morton House, and heard it from the lips that had repeated to her the messages of friends and admirers in the days gone by.

"And Pauline?" she said, eagerly. "I have been sick, Harrison, or I should have been to see her before this. How is she?"

Harrison shook his head.

"You'll see for yourself, Miss Elinor," he answered; "and I'm afraid you'll be shocked, ma'am. But I'm glad you've come—mebbe you'll cheer her up a little."

"Does she need cheering? Is she sick?"

"Oh, no, ma'am, not sick, but so changed like. It was an awful shock to me, ma'am. I'd never a-known Miss Pauline."

"I am changed too, Harrison. We all change in twenty years."

Harrison shook his head again. "Not like her," he said—"not like her."

Then he led the way across the hall, threw open the drawing-room door, with something of his old formality; said, "Walk in, ma'am," quite grandly, and, after Mrs. Annesley had walked in, shut the door, and left her alone with the chill and the darkness—for it was both chill and dark after the glowing softness of the outer air.

Standing where she had been left, the lady looked round and shivered, as if with a sudden ague. This was one of the suite of reception-rooms, which she well remembered—the first one looking to the front—but the curtains were looped back from the arch that divided it from the adjoining apartment; and, when her eyes grew accustomed to the dim light, she gazed straight into the room where she had been married—straight at the very table near which she had stood, and at the very pattern of the carpet which she had traced with her downcast eyes while the ceremony proceeded. Nay, not more than a few steps from her, was the sofa upon which she sat when Edgar Annesley asked her to be his wife, and told her, in his frank, honorable way, that, although he could never love her as he had once loved her cousin, yet he would be to her a true and tender husband. There was the piano on which she had so often played duets with Pauline—there was her aunt's favorite chair; and there her uncle's whist-table. Turn where she would, some memory of the past assailed her; and exclaiming impatiently, "It is worse than meeting a procession of ghosts!" she suddenly crossed the room, and threw open an end window. The sunshine streamed in as if glad of an entrance; and then she perceived the ravages of time—the mildewed walls, the moth-eaten furniture, the faded curtains. "Repairs are needed worse than I thought," she said, half aloud; and, as she said it, she fell to thinking how well these lofty rooms would look newly fitted; how admirably a rich deep green would do for the one in which she stood; and how well green became the blond beauty of Irene Vernon—the girl of all others whom she most wished to see her son's wife. She was so engrossed by these fancies, that the opening of the door did not rouse her, standing as she was with her back to it; neither did a quiet step which crossed the apartment; and it was not until a light touch fell on her arm, that she started, turned, and stood face to face with the cousin from whom she had parted twenty years before.

They stood and looked at each other—neither speaking for a moment. They had lived together in the past as intimately as sisters; but neither of them had ever entertained a sister's regard for the other. Therefore, they felt no affectionate impulse to rush into each other's arms; and, honest in the present as in the past, they did not feign it.

They did not break into any noisy greetings, or take refuge in the commonplaces of ordinary welcome; they did not even shake hands—they only stood and looked at the faces over which twenty years had passed.

A greater contrast than these two faces presented it would be hard to imagine—one so handsome and well preserved, so smooth of skin, so clear of outline, so suave and smiling of aspect, with not a silver thread in the shining black hair, or even an incipient crow's-foot around the cold black eyes; the other so worn and haggard, so deeply lined and darkened over, so bereft of all beauty save the mould of feature and the magic of glance, so stamped with the dreary stamp of suffering, so marked with the bitter signet of anguish, so utterly lost to all the bright bravery of the world, that, save for a proud nobility which still dwelt in, and redeemed it—save for the lovely pathos of the eyes, and the haughty curve of the lips—there was no depth of tragedy in which it was not possible to fancy that this woman might have played a part.

This, at least, was the first tangible idea which came to Mrs. Annesley's mind, as she saw that not even Harrison's dismal prophecy had prepared her for the extent of the change, and as she recognized how far below the surface that change had struck. *This* her cousin! *This* Pauline Morton! *This* the girl who had gone away in the spring-tide splendor of her youth and beauty! "Good God! I can believe anything of her now!" she thought, as she gazed in mute dismay on that world-worn face.

It was Mrs. Gordon who first broke the silence.

"How little changed you are, Elinor!" she said, in a rich, sweet voice; "and how it brings back the old time to see you again—here!"

"But you!" cried Mrs. Annesley, thrown for once entirely beyond the range of her usual conventionalities—"you! Pauline, for Heaven's sake, what have you been doing to yourself that you look like this?"

"Am I so very much changed, then?" asked her cousin, with a smile—oh, so different from the smile that shadowy beauty had worn who stood in the door-way and greeted Mrs. Annesley half an hour before!

"Changed!" She stopped, abruptly; but the tone that said that much had said enough.

There was a moment's silence. Then the other, taking her hand, leaned forward, and lightly kissed her cheek.

"Yours is the first kindred face I have seen," she said, gently, yet with a certain dignity. "Let me bid you welcome to Morton House."

And in the tone, the action, there was that which took the ground from beneath Mrs. Annesley's feet. She had come, meaning to patronize with all the grandiloquent patronage of her changed position; and one second seemed to place her back on the old level, to which Pauline Morton had once bent with this same stately grace, but never succeeded in making her cousin forget that she did bend. For an instant, Mrs. Annesley caught her breath; for an instant, she almost forgot that she was not again the penniless relation who was bidden welcome to a home she might share, but never inherit. Then she recovered herself, and returned her cousin's caress with more effusion than that cousin's manner seemed to warrant.

"My dear Pauline, those words are more mine than yours. Welcome, indeed—welcome to your old home and your old friends!"

"Thank you, Elinor," her cousin replied, quietly. "Pray sit down."

"Of course, I should have come to you at once, if I had not been ill—really ill. I am here to-day in defiance of the doctor."

"Indeed! I should not think you looking badly. But it was one of your old nervous attacks, I suppose?"

"Yes, one of my old nervous attacks," replied Mrs. Annesley, unblushingly. "They seem to grow worse as I grow older."

"I am sorry to hear that.—You must be tired by your drive. I will order some refreshment."

She moved away a few steps to ring a bell, and Mrs. Annesley had a good opportunity for observing how straight and rigid was the dress she wore, how hideous the cap that covered all save a little of the hair so thickly sown with gray, and how every harmless beautifier of the toilet seemed sternly banished from the costume. When she returned, the latter said, wonderingly:

"Have you turned Romanist, Pauline, and are you going to estab-

lish a nunnery, that you dress in such a style as this? You look like a nun, I assure you."

"If you had ever seen a nun, Elinor, you would not think so," the other answered, with a faint smile. "A nun's face is always sweet and serene—not world-battered and world-worn, like mine."

"Then, what do you mean by this?" and the gloved hand touched the black fabric near it.

"I only mean that I have renounced the world as much as if I had gone into a cloister."

"My dear Pauline!"

"Does that surprise you, Elinor? Ah! you have not drunk the dregs of life, as I have."

"Surprise me? Of course, it surprises me. But I don't understand."

"No, I don't suppose you do. I hope there are not many people who would fully understand.—Do you know what I have come back here for?"

"How should I?"

"True, how should you! Well, I will tell you; for I want to make my intention clear to all whom it may concern, and you are one of those whom it does concern. I have come back to bury myself."

"Pauline!"

"Is there any thing strange in that?" said Mrs. Gordon, with another faint, flitting smile. "Women have done such things before—the nuns of whom we spoke, for instance."

Mrs. Annesley did not answer. She gazed at her cousin with blank amazement, and yet more blank apprehension, which might in time have found expression, if the door had not been suddenly burst open, and a boy of eight or nine years old—a magnificent incarnation of blooming health and beauty—rushed into the room, exclaiming, "Mamma!" and did not pause until he stood by his mother's side, staring with unabashed eyes at the elegant stranger.

"Oh, what a handsome child!" cried Mrs. Annesley, surprised for once into an enthusiastic truth. "Pauline, is this your boy? How like you he is! and yet, how unlike!"

"He is not like me at all," Mrs. Gordon answered, in a hard voice. Then it softened suddenly, as she turned to the child. "Felix, go and speak to that lady; she is your cousin."

Felix did as he was told—extending a hand by no means very clean, but given with the grace of a young prince.

"I am glad to see you, my cousin," he said, quite loftily.

And, while Mrs. Annesley surreptitiously wiped her fingers on her handkerchief, she turned again to her companion:

"What charming manners he has! If he does not resemble yourself—and I can see now that he does not—I suppose he looks like his father."

"Yes," was the brief reply.

"Poor child! How young to be fatherless! I presume he cannot even remember—Mr. Gordon?"

"Yes, he remembers him," said Mrs. Gordon, quietly.—"Felix, go and ask Harrison if he did not hear the bell."

"He heard it, mamma," said Felix, promptly. "He's cutting the cake; and I came to ask you if I mayn't have some wine—he won't give me any."

"Certainly not. You can have cake—not wine."

"I don't care about cake, mamma."

"There is no necessity for you to eat it, then, my dear. But we shall see if your resolution lasts when it comes—and here it is."

As she spoke, Harrison made his appearance, bearing a salver on which were set forth the orthodox cake and wine of country hospitality—the former in rich silver baskets, and the latter in slender, old-fashioned wine-glasses. While Mrs. Annesley refreshed herself with a glass of the golden sherry that had been mellowing in the cellars of Morton House for forty years, exchanging with her cousin a few matter-of-course remarks about the weather, expatiating on the beauty of the child, who was still present, and even upon the becoming costume he wore, she was revolving in her mind the altered aspect which the last few minutes had given to the hopes she had so long and so sanguinely entertained.

How easy it is to arrange mentally a supposititious scene and conversation! But when was such scene or conversation ever enacted as arranged? From the moment in which she heard of her cousin's return, Mrs. Annesley's busy fancy had been going over and over again

a rehearsal of the present interview; and each time she had acquitted herself to her own entire satisfaction. She had spoken—suavely patronizing, but uncompromising in her demands; her cousin had answered—gratefully submissive. Not a shade of doubt or distrust of her own powers had crossed her mind; she had believed herself to be absolute mistress of the situation. And, alas! the very first tone of her cousin's voice, and glance at her cousin's face—changed so inconceivably though that face was—showed her the mistake she had made, the self-delusion with which she had been pleasing herself. Memory had played her false—memory, and the vanity that had been fostered by years of unchecked prosperity. At the first glance, she recognized the fact that the Pauline with whom she had been holding her imaginary conversations was but a lay-figure, an automaton of her own creation, which had moved, breathed, trembled, yielded, as her own inclination pulled the wires upon which she had suspended it. The Pauline before her—ah! how could she have forgotten that haughty nature so strangely as to dream of gaining a moment's ascendancy over it? She felt that she was defeated even before she had struck one blow in furtherance of her "plan." This resolution of retirement from the world—why, it destroyed every vestige, even to the very foundations, of the fabric she had so remorselessly reared! The old, bitter hate and envy—the old, still more rankling sense of impotence to harm, even to move, this woman, who had always seemed so unconscious, if not contemptuous, of her enmity—rushed over her soul in a tide of almost suffocating passion. Baffled—defeated—now, as ever before! She could have gnashed her teeth in fury! Baffled—just when she thought success certain! And must she submit unresistingly? Might she not sting, wound, if she could not subdue, this proud nature? She would see.

"Felix, my dear—there is too much noise. Go to Babette, now," said Mrs. Gordon, who by began a romp with the little spaniel which had followed him into the room. "Go!"

"Yes, mamma." And he obediently departed.

Mrs. Annesley cleared her throat nervously, rose, and set down the wine-glass from which she had been sipping, and, returning to her chair, drew it a little nearer to her cousin's before she again seated herself. Then, laying her hand on the sleeve of the close black dress, she said, confidentially:

"My dear Pauline, you quite took away my breath by what you said just now. I am glad you sent the child out, so that we can talk freely. Surely, you do not mean that you intend renouncing society altogether?"

"That is what I mean."

"Impossible! impossible!" cried Mrs. Annesley, assuming an expression of grave remonstrance. "Why, what would the world say?"

"The world of Lagrange, do you mean?"

"Yes. Your own old friends, and those of your parents."

"If the subject interests them sufficiently for them to say any thing, I suppose it will be some of the good-natured things which they used to say of me in the old times. But what does it matter?"

"It matters every thing!—if you do not wish to lose your reputation."

Mrs. Gordon regarded her cousin's face for an instant in astonishment. Then her brows contracted slightly, and a haughty light came into her eyes. "My reputation!" she repeated. "And pray, Elinor, will you tell me what possible connection there is, or can be made, between my voluntary seclusion and the loss of my reputation?"

Mrs. Annesley paused a moment, partly because she was a little doubtful as to what her next words should be—partly with an affectation of reluctance to speak. She looked down at the carpet, thoughtfully—then lifted her eyes to her cousin's countenance, hoping to find there signs of alarm and perturbation. She was disappointed. Mrs. Gordon was waiting quietly for her to proceed.

"Your question places me in a very embarrassing, a very painful position, Pauline," she began, with well-acted hesitation. "But—I think you will agree with me that plain speaking is always best; particularly in a case of this kind, and between friends and relatives."

"Undoubtedly. Plain speaking is always best between people who have a right to speak plainly to each other; and friends and relatives do possess this right," answered Mrs. Gordon, with the dignified simplicity of manner which, to her cousin's elaborate mannerism of dignity, seemed, as it always had seemed, like virgin gold to pinchbeck.

Mrs. Annesley cleared her throat again, and, lifting the top of her *vinagrette*, bent her head and inhaled the salts before she replied, slowly:

"My dear Pauline, I do not know whether you are aware that, to the eyes of the world, your life is veiled in profound mystery; that, until your return, your friends were ignorant of the very name of the man you married; that, even now, the name itself is all that is known. Under these circumstances, is it much to be wondered at that some very unpleasant reports have crept into circulation?—reports which you would be shocked to hear, my dear, I assure you! And, if you take this strange step of secluding yourself from the world, I cannot answer for the consequences."

Mrs. Gordon had listened unmoved to her cousin's words, until Mrs. Annesley came to the last sentence. She smiled then—not scornfully, but with a sort of half-sad amusement.

"Human nature is the same all the world over!" she said. "In the little stagnant pool, as in the great ocean of life, impertinent curiosity and gratuitous ill-nature are the most marked features of 'society.' But, my dear Elinor, I am surprised that you should have forgotten all about my character so entirely as to imagine that the 'opinion of the world' could move me, or give me a moment's uneasiness. Don't you remember how I used to shock you with my disregard for the ideas and dicta of this narrow world around us? And do you think it likely that a cosmopolitan life of twenty years has taught me to rate its importance more highly?"

"Good Heavens, Pauline! You do not know, you do not realize what you are disregarding!—what the reports are—" began Mrs. Annesley, with a consternation which was perfectly genuine—for more and more did she realize that her anticipated power over her cousin had been a chimera of self-flattery. But Mrs. Gordon interposed, quietly:

"I have no more curiosity now than formerly about Lagrange gossip. If it amuses people to talk about me, I have no objection to their enjoying that gratification."

"But, surely, you object to setting a stain on your good name!—on the Morton honor!" cried Mrs. Annesley, driven beyond all self-control by the careless indifference with which the other spoke.

Mrs. Gordon's lip curled in a disdain so contemptuous that her cousin shrank abashed with that consciousness of utter discomfiture in all endeavor to annoy, which had been so familiar and so galling to her in the old days, while the former said, sternly:

"I have returned to my old home, soul-weary and grief-stricken—to seek the shelter of my father's roof, as people sometimes quit the world for a cloister. You tell me that the 'old friends' of my parents and myself are bandying about 'reports' concerning me; that they 'know nothing of my life,' and yet are slandering it! Well, I answer that their gossip and slander are less to me than the hum of the insects around him to the anchorite of the desert; that, for the people who disseminate or believe slanders so false, so malicious, so unprovoked—who dare to suspect my father's daughter of any act unworthy of his name and honor—I entertain a contempt too profound for it to be any thing but passive."

Mrs. Annesley was effectually silenced; but her countenance showed so plainly the dismay, mortification, and chagrin, by which she was literally overwhelmed, that Mrs. Gordon, reading the expression (though not, of course, its cause), and attributing it to a fear of being personally compromised, said gravely, but kindly:

"I know, my dear Elinor, that your ideas and mine do not agree as to the value of the world's opinion. And, if you fear that, you may yourself incur the censure of this opinion—"

"Pauline, how can you wrong me by imagining that I am thinking of myself in the matter! It was alarm for you which, ill as I felt this morning, urged me to the exertion of showing the world at once my position toward you—my estimate of the reports that are in circulation—by coming to offer you the support and advice of a kinswoman."

A smile of irrepressible amusement swept over Mrs. Gordon's face, brightening it into a stronger likeness to its former self than Mrs. Annesley could have believed it possible it would ever again wear. "And have these good people of Lagrange really proceeded so far in their amiable canvassing of my affairs, that you thought it necessary to extend a hand to save me?" she said, with almost a laugh. "I am afraid they would be disappointed, if they knew how much unnecessary trouble they have given themselves. My first order to Harrison, on my arrival, was, that no one but yourself, your children, and

one or two of my oldest and dearest friends, were to be admitted. To all others he was to say that, being in deep mourning, and in deep grief—"her lip quivered with anguish as she spoke the last words—"I must decline society. You see, therefore, that it was premature, to say the least, in the social authorities of Lagrange, to decree ostracism to one who, for reasons entirely apart from any consideration of their existence, had no intention of accepting, far less of asking, their suffrage. It was kind of you, Elinor," she added, with a perfect good faith that made Mrs. Annesley wince, "to wish to throw yourself into the breach in my defence."

"It was useless, I perceive," answered Mrs. Annesley, endeavoring to regain her usual manner, "if you persist in this strange resolution you have expressed. Nothing, which I could say or do would have any effect in righting the public sentiment, so long as you maintain the mystery which was the cause of these dreadful reports. If you would only authorize me to contradict them—to—"

"Excuse me," interposed Mrs. Gordon, quietly. "It is a matter of perfect indifference to me."

"But for *my* sake!" urged Mrs. Annesley, who remembered well that she had many a time gained concessions from Pauline's generosity, which Pauline's pride would never have made—"for *my* sake, Pauline! Think what an embarrassing position I am placed in. Pray, reconsider your resolution!"

"My dear Elinor, I cannot do that," answered her cousin. "I came here, as I told you, to seek rest. I married very unhappily, and have suffered much—have suffered so terribly that, but for the sake of my child, I think I could not have lived through all I have endured. This explanation I make to yourself—not for the benefit of the gossips who, it seems, are busying themselves with my name. Yourself, and the few old friends who, I think, have a right to that consideration from me, shall be always welcome here, if—" she smiled—"you and they are not afraid to brave public opinion by coming."

"You do me injustice by the doubt you imply," said Mrs. Annesley, quickly. "But, for that matter, you always did me injustice."

"Did I?" said her cousin, with a softer light coming into her eyes, and a softer tone into her voice. "Perhaps I did; for I was very prone to rash judgment in those wilful early days. I sometimes think that all I have endured since has only been a just punishment for the faults I cherished then. I am glad to believe I did you injustice, and to beg your pardon for it. Forgive me, Elinor—and let us be friends."

She held out her hand, and Mrs. Annesley could not decline to take it. But she hesitated a moment before doing so, and paled slightly, as she said:

"We won't talk of the past, Pauline, for I dare say the fault of our misunderstandings was as much mine as yours. Tell me about poor, dear Alfred. I was so shocked to hear of his—"

"Death," she would have said, had not the sudden ghastly change that came over her cousin's face stopped the word. It was not the acute grief which cannot bear any mention of its bereavement from careless lips, but the presence of an unutterable horror, which blanched the cheek, and gave so deep an agony to the eye, that Mrs. Annesley saw she had made a great mistake, and stammered hastily:

"Pardon me; I did not mean—"

Then Mrs. Gordon seemed to rally with an almost convulsive effort; and, after a minute, spoke hoarsely:

"It does not matter. I—I only have not learned to bear the mention of his name. Yes, he is dead. Be kind, Elinor—do not ask me any more."

Mrs. Annesley could not disregard such a request. She was silent for some time; half from astonishment, half from offended pride at her cousin's reserve. Then she gathered her wrappings round her, and rose with that motion which indicates departure.

"I am sorry I cannot stay longer," she said, "but I dare not risk over-fatiguing myself. I will come soon again, however."

"Pray do," said Mrs. Gordon, cordially. "Give my love to Morton and Adela. Are they not with you now?"

"Morton lives with me, but he is not at home just now. He has been absent for a week or two. Adela is married, and lives in Mobile," replied Mrs. Annesley, telling the truth—but not the whole truth. "Do you remember your old admirer, Colonel French? Well, one of his sons died, and Adela married the other—a very good match indeed."

"Colonel French—the wealthy widower, as you used to call him?"

How strangely such news makes me feel. To think that Adela should be married—and to one of those little boys!"

"I ought to feel old, ought I not? And yet—"

"And yet you feel young, looking at me. Is it not so?"

"I did not mean to say that, I assure you; but you do look shockingly. I hope you will seem more like yourself when I see you again. Good-by. I cannot tempt you even to Annesdale?"

"Not even to Annesdale."

They shook hands, parted—if any thing more coldly than they had met—and, ten minutes afterward, the Annesley carriage was rolling out of the Morton gates.

CHAPTER VI.—WHAT MORTON SAID.

"It is a good thing that Morton is not at home," Mrs. Annesley had again remarked to her daughter, when she finally made up her mind to action in the case of her cousin; and the event well justified that self-congratulation. A fortnight after the visit in which she had been so signally worsted, Morton returned, and, for the first time in his life, asserted his right of interference as head of the house.

"Mother," he said, when they were at breakfast on the morning after his arrival, and the servants had left the room—"Mother, is it true, as I hear, that our cousin, Pauline Morton, has returned among us?"

There was something unusually grave and formal in the tone of this inquiry, something which made Adela French look up and open her eyes; but Mrs. Annesley answered with admirable nonchalance:

"Yes, my dear boy, she has really returned. I forgot that we heard the news the very day you left. How it must have astonished you! It was quite a shock to me; but my nerves are so easily affected I can stand very little. I suppose you heard. Tallahoma, as you came through?"

"Yes, I heard it in Tallahoma," the young man answered, "and, mother, I also heard something else, which cannot be true."

"It is a very sad affair altogether, my dear Morton," said Mrs. Annesley, quietly; "but there is nothing more likely than that you heard some exaggeration of the matter. What was it?"

She asked the question with honest indifference, for, since her visit to Mrs. Gordon, she had felt, so far as herself was concerned, upon safe ground. She knew that she had always been to Morton a sort of enthroned divinity, who could do no wrong; and it was evident that he hesitated now before saying any thing which might seem even the mildest censure on her conduct. At last, however, he spoke.

"I heard in Tallahoma that our cousin"—he uttered the last two words with emphasis—"has come back to her old home, without having received any welcome from her old friends; and that even you, mother, have failed to give her one."

"I should think you would know by this time how much reliance is to be placed in Tallahoma gossip," said Mrs. Annesley. "As usual they have told you something entirely without foundation; and"—with gentle reproach—"I cannot help thinking it strange that you should credit such a thing of me."

"I did not credit it!" said the young man, eagerly. "I was only afraid that it might be so, because public opinion seems dealing so harshly with this poor woman. And you *have* been to see her, then?"

"Of course I have," answered she, promptly. "How could I possibly neglect such a duty? We were raised together as sisters, you remember."

"And has she been here? Mother, she ought to be here now."

"Morton!—what do you mean?"

"I mean," answered Morton, quickly, "that when a woman is slandered is the time, of all others, for her kindred to close around her; and that Pauline Morton's proper place now is under this roof."

"But, good Heavens! why?"

"Why?" he repeated in surprise. "Dear mother, don't you know why? Don't you know that she is doubted, suspected, slandered, if you will have a plain word; and that it is only thus we can pay the debt of gratitude we owe to those whose roof once sheltered you?"

He looked like a young paladin, with the kindling fire on his handsome face, and the shining light in his dark eyes; and even his mother's heart was touched as he lowered his voice over the last words.

"My son, you do not understand," she said, in a grave, troubled

voice—for it was never her policy to come to an issue with Morton. “you do not understand—and you should trust to me in this matter.”

“You know how much I trust to you,” he answered. “But in this matter—”

“Why do you think it necessary to take up your cousin’s cause with so much zeal?” said Mrs. Annesley, as he hesitated in his sentence.

“I thought I had already explained what really does not seem to require any explanation. Seeing any woman in a position of social difficulty, I should not feel myself a gentleman if, believing her injured, I did not make at least an effort in her defence. And when I see my own kinswoman, one to whom I am bound both by ties of blood and obligations of gratitude—mother, can you ask me why I should take up her cause with all the zeal of which I am capable?”

“One word, Morton,” said Mrs. Annesley, who had been watching him during the last speech, and knew to a nicety how far it was prudent to carry open opposition—“one word, if you please. Has it never occurred to you that Pauline Morton may not be the injured victim you seem to consider her?”

If she had sent a rifle-shot into her son’s plate, she could not have taken him more completely by surprise. He looked for one moment in mute amazement at her face, then a crimson flood shot over his brow, and was visible even beneath the black curls that rested on it.

“Mother!”

“Don’t misunderstand me,” said Mrs. Annesley, quietly. “Don’t think that I mean any thing more than I say. I only repeat my question—has it never occurred to you that Pauline Morton may not be that injured victim which you seem to consider her?”

“No,” answered he. “Is she not a Morton?”

“She is, indeed. But, in short, as I told you before, you had better trust to me in this matter.”

“And, as I told you before, that is impossible,” he replied. “Tell me what you meant by such a question.”

But, what Mrs. Annesley meant, it was very hard—indeed, impossible—for her to explain in Morton’s straightforward fashion; for her only real meaning had been to impress him with a belief that the matter was too delicate for his management. She hesitated before answering; and then said more than she had perhaps intended to say.

“I only meant, Morton, that I am sure you would not like to force me into giving countenance to a woman who may not deserve it.”

“God forbid!” said Morton, hastily. “But, mother, surely you consider what you are saying?”

“Is it likely I would not consider?” asked Mrs. Annesley, dreadfully conscious that the exigence of the occasion was forcing her into doing just the opposite. But then it was so necessary to quiet Morton by saying something.—“Is it likely I would not consider? Ah, you don’t know how I have suffered about this, or you would never reproach me for not doing more.”

“Reproach you! My dear mother, I must have expressed myself very badly if you think I meant to reproach you. Pray forgive me, if I have been hasty or disrespectful—but I feel this matter so deeply.”

“You cannot feel it more deeply than I do,” said Mrs. Annesley, putting her handkerchief to her eyes. “My poor aunt, and my dear uncle, what a blessed thing it is that they did not live to see this day! You may think me unfeeling, Morton, but Adela there could tell you that I have been really ill, and about nothing else but this affair.”

“I could as soon suspect a saint of being unfeeling,” said Morton, much concerned, but smiling a little.

“Selfish, then, when I had only your welfare at heart.”

“You could not be selfish if you tried. But I really don’t see what my welfare had to do with the matter.”

No, he did not see in the least, and, what was more, Mrs. Annesley dared not enlighten him. She knew how much he desired to own Morton House, but she also knew that Morton House would be worse than valueless to him if he once suspected that it had been won by such means as those she had not scrupled to propose to herself.

“I only mean,” she hastily corrected, “that neither you nor I can help a woman who is so utterly reckless that she will not help herself.”

“And Pauline Morton?”

“Pauline Morton refuses absolutely to accept any aid that we can give her.”

“Refuses! How? Pray be more explicit, if only in consideration of my stupidity.”

“I don’t see how I can be more explicit, Morton. She distinctly declines to give any explanation of her singular appearance among us, of the death of her brother, or of the absence of her husband—indeed, whether he is alive or dead, nobody knows. She looks as if she might have walked through a furnace of fire, or been buried alive and dug up again, or lived in garrets on crusts of bread, or—done any thing! And she will neither receive her friends nor accept any hospitality they offer.”

Morton, who had risen from the table, was now standing with one hand on the back of his chair, and he did not speak for several minutes. Then he said, slowly:

“Well, all this only proves that she has suffered, nothing more. Surely we may respect this suffering sufficiently to refrain from prying into it. Can the gossips say nothing more of her than this?”

“You can best answer that question,” said Mrs. Annesley, stiffly. “I am not likely to hear what gossips say of my own cousin. But I think it is more than ought to be said of any woman.”

“Mother, that does not sound like you,” said her son, gently. “Remember how often you have agreed with me that misfortune should never be confounded with fault. We have no right to suspect more than misfortune here.”

“Not if Pauline had come back as her position demanded she should come—with some guarantee for her past, and some regard for appearances in the present. Not if she—”

“In one word, if she had not needed your friendship. Oh, mother, that I should hear such social cant from your lips! Her old associates, then, would have been willing to extend their hands to her, if she had not needed them; as she does need them, they consider that a sufficient reason for holding aloof. What a pitiful world it is!” said the young man, with a sudden scorn flashing into his face; “and how much it is alike in every place and condition of life! Mother, one more question, and I have done. I am sure I need not beg you to answer me frankly. Do you, or do you not, believe that Pauline Morton deserves the suspicion that seems to have fallen upon her?”

Was ever diplomacy placed in a more trying position than this? Reply in the affirmative Mrs. Annesley could not, without a more daring violation of truth than even *her* conscience would allow; and, to answer in the negative, would be to undo all her previous work. Clearly, then, the only resource left was that of evasion, and this she employed with commendable quickness.

“Good Heavens, Morton! How can you ask me to decide such a question, and about my own cousin, too? You should be more considerate of my—my feelings!”

“I am asking you to be considerate of the honor of your name, mother,” said Morton, half-sternly. “Do you know what people will say if you do not face that question and answer it boldly?”

“I must consult my own conscience, and not what people will say,” answered she, with dignity.

Morton took his hand from the chair, and made a quick turn up and down the room before he spoke again. He stopped abruptly then, and fastened his eyes on her face:

“Then, mother, you, too, doubt this poor woman?”

“Doubt her?” She hesitated a moment, but saw her way to no other answer than the truth. “No, Morton, I do not.”

“In that case, you consider her unjustly suspected—do you, mother?”

There was something truth-compelling in the direct question, in the earnest eyes, and still more earnest voice. Before Mrs. Annesley knew what she was about, she had uttered a reluctant “Yes.”

But, even after this, she was not prepared for what followed. She was astonished when Morton crossed the floor, rang the bell, and said to the servant who answered it:

“The carriage.”

The door had hardly closed before Mrs. Annesley cried:

“Morton, what does this mean?”

“It means,” said Morton, “that I am going to see our cousin, and that I hope you will accompany me to urge her return with us to Annesdale.”

His mother looked at him in silent exasperation. If she had given way to her first impulse, it would certainly have been one of fierce reproach, since anger was burning hotly enough in her heart against this ungrateful return for all her exertion. But one thing which she had learned in life was the folly of passion. So she curbed herself with the steady curb which long habit had rendered easy, and answered quietly:

"I am afraid you must excuse me. Dr. Reynolds expressly forbade my leaving the house until he saw me again. Besides, Morton, since you absolutely refuse to be guided by me in this matter, I cannot think that I am called upon to expose myself to another repulse for your sake."

"Another repulse?"

"Yes, another repulse. I thought I told you that Pauline has already declined the visit which you wish me to urge on her a second time."

"Did you really urge it the first time, mother?"

"Did you ever know me lacking in hospitality? But, since you distrust me, go your own way, and find who is right."

She spoke gravely, but without any touch of pettishness; and Morton hesitated. Perhaps, after all, she was right—perhaps, after all, he was wrong. Who was so likely to be wrong as himself, thought the young man, with the humility which was his most prominent characteristic. Surely his mother was better able to judge of her cousin than he who had never seen that cousin. In trying to act up to the standard of his chivalric creed, he began to fear that he had not only been very obstinate, but also very foolish. So, after a pause, he spoke quite humbly:

"I have never done such a thing as distrust you in all my life, mother; and I am sure I have no desire to go my own way simply because it is my own way. If you think the invitation had better not be given just at present, I am perfectly willing to defer it. But that is no reason for deferring my visit. Since you cannot accompany me, I am sure Adela will."

He looked at his sister as he spoke; and Mrs. French shrugged her shoulders, as she answered carelessly:

"Indeed, I would not advise you to be too sure, Morton, for I have not an idea of doing any thing of the kind."

"Why not?"

"Simply because I don't choose to."

"Adela!" This was Mrs. Annesley who broke in with a tone half-warning, half-reproachful.

"Well, mamma," was the saucy reply, "you surely don't think I am going to let Morton tyrannize over me as he does over you? When one doesn't mind one's husband, one isn't likely to mind one's brother—do you think so? He must get him a wife, if he wants somebody to go with him whenever he takes a fancy to visit superannuated beauties."

"I did not ask you to go as a favor to myself, Adela," said her brother, a little haughtily.

"So much the better," answered she. And, at that moment, a servant opened the door and announced the carriage.

"I was wrong," said Morton, turning to her. "I do ask it as a favor to myself. Will you go?"

"Not on any account," said the young lady, with emphasis. "Nothing would induce me to go. I hate disagreeable people—besides, the Raynors and Irene Vernon will be here to dinner to-day, and I would not tire myself out for the world. If you will go, that is no reason why I should be so silly."

"Have the carriage taken back, and my horse brought out," said Mr. Annesley to the servant.

After this, there was ten minutes' rather uncomfortable silence in the room. It was broken at last by Adela, who had sauntered to the window, and, with admirable nonchalance, announced the appearance of the horse—adding the gratuitous information that he did not look quite as well groomed as usual.

"Probably not; those scamps grow careless if I am away from home a week," said her brother. He turned to leave the room, saying to his mother, "I shall not be back until dinner."

"But you must be back in time for dinner—don't forget that, Morton," she said, anxiously.

"I shall not forget it," he answered.

When the door closed on him, Mrs. Annesley drew a deep breath of relief, and looked at her daughter, who was still standing by the window. Their eyes met, and Mrs. French laughed.

"Poor Morton, how simple he is!" she said. "I wondered you had patience to fence with him so long, mamma. Do you think he means to spend the morning at Morton House?"

Mrs. Annesley shook her head. "I wish he did," she answered. "He means to spend it in Tallahoma."

"Mamma," said Mrs. French, setting her teeth sharply, "I would make an end of that business, if I were you."

"Suppose you could not, Adela?"

"As if you could not always do any thing you want to."

"Morton is terribly obstinate."

"Morton is like wax in your hands."

There was a moment's silence. Then, not very relevantly, as it seemed, Mrs. Annesley said, "When does Irene Vernon leave?"

"Not before New Year. You know she is engaged to spend Christmas here."

"Yes, I know."

They said nothing further—but, after another minute or two, Mrs. French kissed her hand, and gayly waved it to some one outside the window.

"It is only Morton," she said, as her mother came forward and looked over her shoulder. "I am wishing him good luck."

They both watched the graceful rider out of sight; and Mrs. Annesley, as she turned away from the window, said, with a low and somewhat bitter laugh, "Let him go. He will not be admitted farther than the door of Morton House."

[TO BE CONTINUED.]

"THE NEW PEOPLE."

BY ANNIE THOMAS, AUTHOR OF "FALSE COLORS," "DENIS DONNE," ETC.

THEY were spoken of in this way with rather a disparaging stress on the second word of the sentence, for many months after they had taken up their abode in Southhill. The shadow of a change fell so seldom over the quiet, retired little place, that its inhabitants made the most of one when it did come—talked about it for long, and speculated about it with a fresh interest, that would have seemed supernatural to the denizens of the busy world, who are afflicted with a change every hour of the day.

Southhill was of a size too large to be called a village, and several sizes too small to be deserving of the name of a town. So the Southhillites compromised matters, and called it, lovingly among themselves, "our place."

It was not an agricultural place, nor did it share in the manufacturing interests of the district in which it was located—a little oasis of inaction in a desert of hard work. It had no strong religious views; it took but a limp interest in politics; it cared nothing at all for the sporting world, and rarely so much as heard of a play or an opera, or any thing appertaining to matters theatrical. It had a circulating library though, which drove a fine, flourishing, healthy trade in novels, and in its midst a substantial old red-brick building, called "The Institute," opened its hearty, honest-looking portals widely twice a week, for "purposes of mutual improvement and recreation."

Society in Southhill was not brilliant, as may be gathered from this brief preface; but, on the other hand, it must be understood that it was "very select." This latter fact the Southhillites carefully impressed upon one another, whenever they gathered themselves together at each other's houses. And it seemed to comfort them considerably that it should be so. Indeed, they may be said to have accepted the circumstance as recompense in full for being very dull, and as substitute for any kind of attempt to regale each other.

The houses were detached for the most part, and were occupied by a set of people who knew "all about" each other. Their worst and their best, their grandfathers, and the extent of their intimacies with every one, the exact figure of their incomes, and pattern and quality of their bed and table linen, were public property. Need it be said that society in Southhill, in addition to being very select, was very censorious?

The aristocracy of "our place," by reason of their being the occupants of the two biggest houses in it, were the Atkinsons and the Dormers. The honors were equal between them, so to say. If the first soared to the height of a carriage and pair and two men-servants,

the second had the best name and furniture, and the biggest conservatory. And if the Atkinsons could boast (as they did frequently) of having had a dignitary of the church on a remote branch of the family-tree, the Dormers could produce a living law lord, which equalized matters.

There was no male head of the house of Atkinson, at the time of which I write. The family consisted of the widow and her three daughters—virgins all, and rather foolish virgins, too, if the truth must be told. They belonged to the genus which defies the curate, and works him offerings of divers colors of needlework curiously wrought. And, for all the return the current curate had made to them, he might have taken the vows of celibacy.

The Dormers were "more happily circumstanced," as Mrs. Atkinson was wont to observe in one of her unexceptionable little set-phrases. Mr. Dormer was extant still, and his only child, a daughter of about twenty-two or three, was in the way of being an heiress in Southhill. This belief, which attached to her, together with the fact of her being prettier than any other girl in "our place," caused her to be watched with a wary eye by the rest of the confraternity, about whom were no such dangerous and snaring possibilities as probable heiress-ship and possible beauty.

The rest of the Southhillites may be put in with a few bold strokes. There were the Jenningses, two maiden sisters with soft hearts and harsh voices, who were always doing good by stealth, to the utmost of their ability. There was the vicar, Mr. Watson, and his family, and the doctor and the lawyer, and their respective wives, and a few retired old gentlemen and ladies, who all marketed, and went to church, and gave mild little tea-and-toast entertainments to each other on exactly the same pattern.

There had been no invasion of outsiders into Southhill for many a long year, when, one day a house, which had stood empty and been the talk of the place for six months, was taken by a stranger. Southhill met in unpremeditated conclave at the butcher's and grocer's in the morning, and at a light repast of muffins and coffee in Mrs. Atkinson's drawing-room in the evening, to discuss the startling fact. The new people had done unprecedented things. They had come down, looked at the Paragon (as the "topic" was called), and taken it for three years about ten minutes after that look. Further, the Miss Atkinsons had it "from the best authority, the very best," that they had not made any of the usual inquiries; were equally careless about the best shops, and the drains, and the church services, and had actually come into the midst of Southhill without a single letter of introduction.

The only fact that had been definitely ascertained relative to the new arrivals was their name. Their name, Kevern, was not bad; but then, on the other hand, it was not good enough to set all doubts at rest. The father and mother were middle-aged people, and the sons and daughters were just grown up, and were as young, handsome, and happy-looking a lot as Southhill had set eyes on for many a long day.

"As far as looks go, there is nothing to be said against them, is there, Mr. Pendrean," Miss Dormer said to the gentleman who has been casually mentioned as the current curate.

"And looks go a long way," Mr. Pendrean answered. And, somehow, his answer fell flatter on her ears than words of his were wont to fall.

"They are going to keep horses, because Robert heard that another stall was to be built in the stable," Miss Atkinson said, with the air of one who was bringing conclusive evidence to bear upon something at least, "so they must have money; but where do they get it, or how do they make it?"

"Retired from trade, perhaps," Lily Dormer suggested; "we must find out before we call."

"The dear bishop used to say one couldn't be too careful about making new acquaintances," Mrs. Atkinson put in; and then Mr. Pendrean asked "how many generations were required to purify gold made in trade."

"Oh! we don't look down on those connected with trade," Miss Atkinson explained, graciously; "but we are obliged, of course, to hold aloof from them. We shall soon detect what society these new people have moved in."

"Shall I go on an exploring expedition into their midst?" he asked, with a laugh in his eyes. And Mr. Pendrean's were very beautiful eyes, and the laugh came into them pretty often, when he was talking to his parishioners.

"If I were in your place, I should be very careful to avoid intimacy," the Miss Atkinsons chorussed; and Lily Dormer tossed her pretty head and avowed that "the Miss Keverns seemed so free and easy, that it would be hard to avoid the appearance of intimacy with them, at least."

"But as they are here, and as they may be respectable, though we know nothing of them," Mrs. Atkinson said, with the large charity that is characteristic of the species, "some of us had better call; we can draw back, if they are not desirable, you know; shall we call and report?"

This was magnanimous on the surface, but the rest of Southhill was to the full as curious about the new-comers as the Atkinsons were. It was kind of her they averred, suavely; but they one and all declined to put the onus on her of detecting what there might be to be detected, and deciding on what was to be decided upon. They would share and share alike. So, the claims of both friendship and curiosity would be appeased.

Mr. Pendrean had other claims than those of his office upon the consideration of Southhill. He was young, he was well-off, he was well-born, he was well-educated, well-bred, and well-read, and altogether an object of much care and thought in Southhill. Marriageable girls, and the mothers of marriageable girls, and, alas! for them, girls who were not marriageable also, gave a good deal of thought to him. It was looked upon as being quite in the order of things that he should take one of the daughters of the land to wife. And after a good deal of heart-burning, and of envy, hatred, and malice among themselves, they had agreed to let Lily Dormer have him without opposition. That is to say, without giving vent to the feeling in so many words, they tacitly acknowledged that hers was the best chance, and, she being a genuine Southhillite, they would not mar it.

Not that Mr. Pendrean had committed, so to say, decided acts or words of preference for her yet. After the manner of young men, he was glad to see as much as he could of the prettiest and nicest girl in the place. But he never sought her in a marked manner. If she crossed his path, he was genuinely and openly glad to see her—far too openly glad, indeed, for the girl's own hopes to be very high. Still, when joked about him, she always bore herself as one to whom he was a little more than he was to the rest of the world. And this she did subtly, after the manner of some girls, without committing herself to any definite statement. It will be believed, then, that it was more in anger than in sorrow that Southhill saw this object of so many hopes, and fears, and conjectures, wend his way on the following day to call on the new people.

Such a charming surprise awaited him. Mr. Kevern (why hadn't it struck Pendrean before?) was the novelist of that name, come down for a spell of country-life, that he might infuse some of the freshness of the same into his books. And his daughters were a brace of bewitchingly-clever and pretty girls, whose only anxiety at present was a fear that they might not be able to follow honorably in their father's footsteps.

"You see, for the name's sake, it wouldn't do to sit down and write twaddle," they were wont to observe, and the fear that they might never be able to write other than twaddle oppressed them at some odd half-minutes of their lives.

"Are there any nice girls here?" Kate Kevern asked, rather anxiously of Mr. Pendrean. "We have only seen old ladies as yet."

"The Miss Atkinsons are a host in themselves," he said; "they are going to bear down upon you to-day, I know."

"Oh! the Miss Atkinsons. Ah! they are some of the old ladies I meant; is there nothing younger in Southhill?—Papa, papa! this is a bad lookout for you; where will you find models for your young women?"

"There is Miss Dormer; have you seen her yet?" Mr. Pendrean said, and Kate Kevern, looking at him narrowly, saw that he had to set his face very resolutely to avoid a transient expression of emotion of some sort crossing it as she questioned:

"Tell me about her—is she young and pretty—do you like her?"

"She's the nicest girl in the place," he said, heartily.

"Humph!" Kate Kevern looked thoughtful. "I dare say I'm foolish to push inquiry further, but would you mind telling me—"

She stopped abruptly and blushed, and when she blushed a light fell upon Mr. Pendrean's mind. Kate Kevern was a remarkably

pretty and nice girl herself; Lily Dormer couldn't hold a candle to her!

"Will I mind telling you what? I don't think I should mind telling you any thing, Miss Kevern," he said. And then the thought that he was really going a little too fast smote him, and he hailed a remark from the youngest Miss Kevern with gratitude.

"I believe Kate was going to ask what constituted Miss Dormer the prettiest and nicest girl in Southhill; and then she remembered that asking for definitions always sounds pedantic and affected; we'll be much more frank than you are, Mr. Pendrean. We'll tell you what we think of your parishioners without giving you the trouble of asking."

"Perhaps, children, he won't care to know your opinion," their father said, with a look and a laugh that convinced the guest that there was great confidence and great peace in the camp of the Keverns.

He went away from the new people to his solitary lodgings very thoughtfully that day. For more than a year now he had been "one of them" in Southhill, so much one of them indeed, that he had come to the part not only of accepting them as they were, but of almost believing that, as they were, they were scarcely susceptible of improvement. But by the light shed by these new-comers he saw those who were indigenous to the soil more plainly and less pleasantly.

"Mr. Pendrean! Mr. Pendrean!" He had reached the door of his own house, and was about to let himself in with that prized symbol of independence and bachelorhood, a latch-key, when Lily Dormer's familiar voice struck upon his ears. He looked round, and there she was, in all her bravery of summer apparel—a gayly bedight butterfly whom it would be a shame for any poor man to take and turn into a household grub.

A pretty upright figure, slender and straight as a dart, robed in the walking-skirt and train, and jacket, and bows, and boots, and bonnet of the period. "Very well dressed for a country-girl," was his critical dictum as she put her ashen-gray gloved hand out to him—"very well dressed and well-mannered too, but lacking a something that Miss Kevern had."

"I'm going to call on the new people," she said, suffering her hand to repose in his.

"That's right," he said, encouragingly. "I have just done my duty in that respect."

"You lost no time in doing it," she said, in a slightly-piqued tone.

"And I was rewarded by finding the young ladies at home," he said, laughingly. Remember there had been no love-making except in the imagination of their friends between these two. But Lily always felt that the possibilities were great, and so was apt to regard any hindrance to them as a positive wrong.

"I've no doubt you did, and that they showed their fairest side to you," she said, waxing savage as she sought to become sarcastic. "I've been to the library, and I hear there that they are little better than pagans—judging from the books they have sent for—"

"Our excellent Miss Whiddle's Christianity must have had a severe shock. I hope she couldn't supply that undesirable class of literature."

"I do wonder at your scoffing and joking about it; but now tell me—shall I call on them?"

"Yes, go; there's a good girl."

"You wish me to show them attention?" she interrupted, with a little eager, confiding air that made him conscious that it behooves a man to be very careful in his dealings with those guileless creatures the girls of the period.

"Well, I think they are people that it will do us all good to know," he said, bluntly; and, though Lily Dormer gave him her softest looks, she could get no other sign or word of peculiar interest in her from him than this: "I think they are people that it will do us all good to know?"

It was rather a shock to Southhill when it discovered that Mr. Kevern actually wrote some of the novels which it devoured with such a voracious appetite. In common with a great mass of our fellow-creatures, the inhabitants of Southhill, though tolerant to novels in the abstract, had a huge distrust of them in the concrete, and a huge dislike to the individuals from whose brains the novels emanated.

"Such things are very well to read," Mrs. Atkinson said, in a flutter of virtue and maternal solicitude, "but, when it comes to intro-

duce one's daughters to the people who write them, I think, Mr. Dormer, we can't be too careful."

"We can't, indeed," Mr. Dormer responded.

He had the hazy notion so general among the rural, wealthy middle classes, that all professors of literature were either mad, bad, or dangerous.

"I think Mr. Pendrean is very weak to go so much to their house," Mrs. Atkinson went on, complacently. "To be sure, he is the clergyman, and a clergyman may go anywhere with impunity; but he is a young man, and we all know what young men are liable to, my dear Mr. Dormer."

"Ah!" Mr. Dormer said, wearily.

It was well known in Southhill to be the dear wish of Mr. Dormer's heart that his only child should compass the capture of the special young pillar of the church whose mission it was to seek to save souls in Southhill. Therefore, Mrs. Atkinson's speech held a double sting for him, implying, as it did, doubt of Lily's powers and of Mr. Pendrean's constancy.

Meanwhile matters were progressing very pleasantly at the Paragon. Mr. Kevern had redeemed the time of his sojourn at Southhill by sketching it and its specialties graphically and remuneratively in the pages of a popular serial. His sons had been studying under the guidance of a tutor in the neighborhood. One daughter had "found the meaning" the beauties of Nature had for her, and was working hard at drawing under the auspices of a distinguished painter, a friend of her father's. And Kate had found the meaning of her heart under the auspices of Mr. Pendrean.

The knowledge had come to her in this way. After a sojourn of several months in Southhill—during the whole of which time Mr. Pendrean was as regular a "daily occurrence in their house as were the daily papers or dinner," as they were wont to observe—words were whispered in the place that came round to Mr. Kevern's ears.

In his happy, careless, unobservant way, the father of the family was in the habit of leaving his girls very much to their own devices. They had been trained more after the manner of boys than of girls, trained to abhor lying, and deceit, and scandal, and pettiness of all sorts, and Mr. Kevern knew that he could trust them thoroughly. But, when these words reached his ears, he took one of the precautions that less reliant parents are obliged to take sometimes—namely, he threw out a warning.

"I find our friend, the good young priest, hasn't been wasting his time quite as much as I supposed," he began, just as they were sitting down to dinner one day.

"Let me give you a glass of your favorite sherry, to enable you to make your meaning clearer," Kate said, laughing.

Mr. Kevern liked to be helped to sherry by his pretty, sparkling daughter; he always fancied himself well up Parnassus on those occasions when Kate played the Hebe.

"I'll give you three guesses at my meaning," he said, sipping his wine; "who'll begin?"

"Mamma shall go first," they chorussed.

Mrs. Kevern hazarded a belief that "Mr. Pendrean had got a living."

"Wrong. Now, Kate."

"That he has Romish tendencies all the time he is letting himself be purged upon by the evangelical Miss Atkinsons," Kate said, laughing merrily.

"Farther off the mark than mamma; one of my sagacious young women would have answered that she 'had a presentiment,' or that 'her heart foreboded' something quite different." Mr. Kevern then said, carelessly: "Come, Meg, it's your turn. Show more discernment than mamma and Kate."

"He's fallen in love, I suppose," Margaret said, indifferently; "they all do it, you know, papa—in real life as well as in your books."

"Oh, wise young judge! you are right; now three guesses at the lady's name."

When the father said that, the mother's instinct caused Mrs. Kevern to glance at her eldest daughter. Kate had hoisted "red flags" in her cheeks, but there was no sign of discomposure.

"Mrs. Atkinson, perhaps," Mrs. Kevern said, laughing. "It's as reasonable to guess that it's Mrs. Atkinson as it would be to say any of the other women of this place."

"No, it's not Mrs. Atkinson," Mr. Kevern said, looking steadily

at the centre vase ; " it's Miss Dormer ; let us all drink to his happiness and prosperity."

And Kate put her lips to her glass, and toasted him in a bumper with the rest.

But, though she did this, she was stabbed, and moreover she knew that they all thought that she was stabbed. Those months of incessant intercourse with him had been very sweet to her, when unalloyed by any thought of Lily Dormer or any other feminine roots of bitterness interrupting it. He had won her, and the girl knew that she had suffered him to see that he had won her. And now, without a word of preparation from him, she was told that he had left her—left her for Lily Dormer ! How her parents and brothers and sister would despise him !

They were very considerate to her. The clever, loving father, having given his warning, did not torture her by looking to see how she bore it. He had spoken with judgment, and with mercy, too ; and Kate was grateful to him. For his part, having got the truth out, he would fain have dropped the subject, but Kate wanted to hear more.

" Who told you this, papa ? " she asked.

" Old Dormer hinted it to me, and Miss Atkinson confirmed the statement he half made."

" Will you mind telling us how he hinted it, my dear ? " Mrs. Kevern asked. (She saw what her daughter wanted.) " He's a blundering old fellow, and perhaps you have mistaken him. I'm sure I hope you have. I don't like to think Mr. Pendrean so deficient in taste."

" Let me see. How did he do it ? I could do you the dialogue beautifully on paper, but the *viva-voce* business bothers me ; he was speaking of investing money, and he said : ' When a certain affair comes off, I shall buy him a living ; ' and he nodded his obtuse old head in the direction of Pendrean's parlor-window. Then he walked out of the library, and the ugliest of the Atkinsons came grinning up to me and said : ' Didn't you know that, Mr. Kevern ? Oh, dear ! with your knowledge of character, too, and your talent for analyzing things of the sort. I am surprised ; every one expected that Mr. Pendrean and Miss Lily Dormer would have made a match of it long before this.' "

Kate had recovered her spirits by this time.

" Papa, how beautifully you can do ' Russian scandal ' all by yourself ! I have played it with a dozen in the game, and it hasn't attained such magnificent proportions as you have given to this bit of gossip."

But, though she spoke of it as a " bit of gossip " only, the thought of it made her tremble a little the next morning when the well-known, firm, quick step came crunching along the gravel outside the drawing-room window, and the well-known voice cried out :

" Miss Kevern, I've come to propose an expedition to you—a ride round by the pine-woods." For they were fond of bewitching the world with noble horsemanship, these young people, and a good deal of mischief had been done during their many " quiet rides."

" No, I can't—yes, I will—I'll go," Kate said, boldly ; and then she determined that she would know the truth.

" What will Miss Dormer think of you're riding with me ? " she asked.

" Miss Dormer ! "

He was too honest to affect more than a faint surprise at hearing her feelings concerning him questioned.

" Yes, Miss Dormer. Yesterday papa heard—"

But, before she could say it, " Miss Dormer " was announced, and came in, smiling blithely.

" He might have spared me this," Kate thought, indignantly.

Nevertheless, she greeted her visitor cordially, and puzzled Mr. Pendrean very much by asking Miss Dormer to go with them.

" Good as well as ill, woman's at best a contradiction still," he muttered to himself. " What can she want of that girl ? She must have heard that Miss Lily would have smiled if I wanted her to smile. Well, I suppose she doesn't care for me herself, and wants to stop my speaking ; " and he drew a hard breath, and wished he had never seen Kate Kevern.

It was a miserable ride—miserable for all three of them. Kate had an angry, sore feeling at her heart, and neither the bright sun nor the scent of the pine-tree woods were sweet to her.

" I have deceived myself ; I have been lightly won ; I have brushed the bloom off my heart ; and I can never, never, never be the same again," thought the girl.

With this thought in her heart, what wonder that she did not prove an agreeable companion ?

As for Mr. Pendrean, his case was even worse than hers. For months past he had been telling himself that in this girl his heart recognized its queen. In spite of all those little sayings and looks in which Southhill indulged itself, Lily Dormer had never stirred his blood to a quicker flow, or his tongue to a loving word. It was hard to have her thrust upon him by the woman he loved.

Poor Lily's case was not an enviable one either. She was not an adept in the noble art of equitation, and still, as she had always professed to be " devoted to riding," it was incumbent on her, she felt, to put a brave face on the fact of the mare she was riding being a skittish one. " Papa is no judge of horses, or he'd never have got me such a half-broken brute as this," she said pettishly, once when she had been jerked out of her balance by a peculiar *pas de fascination*, which the mare elected to dance at a donkey they were passing. And then Kate Kevern, whose heart was so nearly broken that she felt it would be of little consequence if her neck was quite, offered to " change horses."

" It boots not to delay " in the telling of my tale. Once there was a great chance, a rare chance, of the young people coming to a right understanding with one another, and that supreme moment was when Pendrean was putting Kate Kevern up on the skittish horse. He looked up in her face with the inquiring, loving look she knew so well, and for one moment she was melted by it. The next moment she resented it, and the opportunity was past !

" Oh, my love, my love ! why have I given it to this man ? " she thought.

" I'll never trust a frank face and gentle eyes and words in this world again ! " was his simultaneous reflection.

" Let us leave this, papa," the mother said, the following day—" let us leave this place, papa. Our girl isn't happy here ; " and he was too chivalrous a gentleman to question concerning that which the mother and her child would keep sacred.

So all Southhill was in arms in a few days at the abrupt way in which the Keverns took their departure.

" Probably they're in debt," Mrs. Atkinson kindly observed ; " those literary people always are shiftless."

No one suspected that it was because of those idle words spoken at the little library one morning that they left their sylvan haunt.

Their sylvan haunt ! When I paint my great picture of " Slandered Virtue," I will place her in the midst of green fields and breezy groves. To the simple-hearted denizens of our country towns and villages must be ceded the honor of being " quick with the tale, and ready with the lie," to a degree that is unattainable in the busier places of the world. After all, there is nothing so beneficial as country air for the whispered words that poison truth.

The Keverns went away with their wounded deer, and Mr. Pendrean pursued his path very moodily for a while. It was evident to him (oh, blind and foolish of understanding as the cleverest men are !) that Kate Kevern repented of that gay, generous cordiality and intimacy with him which had led him on to love her, and that now, liking him very much, still she wanted to console him with Lily Dormer. Well, he must bear the brunt of the evil that was brought into his heart as best he could. Only it " would make him very chary of trusting a woman again," he told himself.

Lily Dormer pressed the siege hotly when the " pretty Kevern girls " left Southhill ; but the city she besieged never fell a prey to her. And many months after, when the Keverns were such things of the past that people couldn't feel actively malicious about them any longer, a light was let in upon the curate's mind respecting their retreat.

" You are not looking well, Mr. Pendrean," Mrs. Atkinson remarked to him. " I did think that long before this you would have had a wife to look after you."

" Did you really ? " he said, dryly.

" Well, to tell the truth, we all looked upon it as a certain thing, and even spoke of it as a certain thing with Lily Dormer ; and now she's going to marry some one else."

" Spoke of it as a certain thing, did you ? No, I never aspired to the honor of Miss Dormer's hand ; she's a dear little thing though, and I hope heartily she will be happy."

" Yes, I remember speaking of it to Mr. Kevern one day just before they left," Mrs. Atkinson said ; " he was very much surprised."

" Well he might be," Mr. Pendrean said, standing up, and saying

good-by. And then he went home and wrote to Mr. Kevern, *via* that gentleman's publisher.

That letter reached a house of mourning. A sorrow-stricken mother prized and valued it though, and came to regard the writer of it as a cherished son. "If our Kate had only lived to receive this explanation, how happy we should all have been!" she said to her husband. And he winced at the power of love, he was in the habit of depicting so thrillingly, having been brought into his midst with such cruel force. Kate Kevern had died of that which had been revealed to her lover too late for him to save her with the glad tidings that the idle words were idle words indeed, and that he was true, as she had broken her heart in doubting him to be.

ADVERTISING.

ADVERTISING may be divided into two classes, the legitimate and the "puff." Under the first head may be included legal and business notices and mere uncolored announcements, put forth for the sole purpose of giving publicity to a certain fact. So far as these are concerned, there is little, if any, of the "humbug" element involved; and, whether such advertisements are published in the form of handbills, posters, or notices in the columns of local journals, all is comparatively straightforward and above-board. But how about the puffs, the puffers, and the puffees? Take up a newspaper, reader—one you will do—and run your eye down the advertising-column: what will be your first impression? Most probably one of bewildered admiration and regret at what may, very likely, appear to you a wasteful expenditure of ingenuity and money. But *is* it wasted? Some people may think so, but they are woefully mistaken. Experience tells a different tale. Some of the devices employed to attract attention are certainly both shallow and transparent, yet even these will "draw" a certain class of the community. Ask a practical advertising-agent, and he will tell you, almost to a fraction, what the expenditure of a specified number of dollars will bring in; and, strange to say, the larger the outlay, the greater the *percentage* of profit will be! Take, for instance, the item of patent medicines—commodities for which there would be absolutely no sale whatever without resorting to advertising. There is one firm in New England, extensively engaged in this business, the head of which began life, some forty years ago, as a poor little ragged urchin, running errands for a druggist in a provincial town in the State of Massachusetts, at the munificent salary of a dollar a week, and who at present pays more than two hundred and fifty thousand dollars per annum for newspaper advertising alone throughout the Union, and distributes, gratis, about seven million pamphlets, printed in eight different languages (Chinese included), besides handbills, etc., costing many thousand dollars more! What his profits are may be guessed from the simple but suggestive fact of his paying about fifty-six thousand dollars a year to the United States Internal Revenue for the two and four cent stamps affixed to the five different preparations which he offers for sale! There is one great peculiarity in advertisers of this class: *their advertising must be continuous*. It must never diminish nor be relaxed even for a day. Were there a lull or cessation in the stream in any one district, however insignificant, the result would immediately become apparent in a waning of popularity and diminished sales. A patent-medicine business, accordingly, can never be properly called "established," for its existence depends solely on its being kept before the public. When advertising is discontinued, the business becomes defunct, and can rarely be resuscitated.

The enormous increase in the number of advertisements nowadays has naturally caused a deal of competition; people must keep pace with the times, and consequently brains are daily tortured and ingenuity racked to produce something original and startling to catch the public eye and tickle popular fancy. Sometimes we see a notice "set up" in the actual shape and form of the article advertised, such as a teapot or a hat; again the paragraph appears with a rough blank-line drawn completely through it—an artistic idea, and one which rarely failed to attract attention before it became so common. Then we have occasionally a whole column left blank, with the exception of the name and address of the advertiser with one or two of his "*spécialités*." All these, however, are mere appeals to the eye; far greater variety, and even more ingenuity, is displayed in the compilation and actual wording of some of the mendacious and insinuating

announcements which have a higher and bolder aim, that of directly engaging our sympathies and exciting our interest. Specious and plausible, indeed, are some of these, the two grand ideas being for the advertiser to leave no stone unturned to puff his own wares and to depreciate those of each and every one of his competitors. Articles christened after the names of celebrated or notorious characters will always command a sale for a time; dry-goods going at "Tremendous sacrifices!" or "Selling under cost!" if announced in flaring capitals, will always draw crowds of ladies, while the sterner sex will offer themselves as only too willing victims at the shrine of the first new hat they see labelled "The Latest Parisian Novelty!"

There are many other methods of advertising—some of them even more illegitimate and objectionable. The attainment of personal notoriety is a great "draw." The possession of a fast horse or yacht, an exceptionally splendid equipage, a regal mansion, palatial business-premises, or a lavish expenditure, have frequently proved winning cards; while sensational domestic squabbles, carefully elaborated in the public press, have been resorted to, and not unsuccessfully either, by some unscrupulous adventurers to attain the great twin object of their ambition—money and notoriety. We have poetical puffs as well; and these, although for the most part rapid and drivelling doggerel, sometimes scintillate indications of wit, humor, and positive genius.

Then there are theatrical "stars" and musical celebrities, with all their grandiloquent trumpet-blowing and tawdry belongings. In no profession or trade is advertising so much used and abused as in this. "Gorgeous scenery, new and costly dresses, decorations, and properties, with original and appropriate music *composed expressly* for this occasion!"—these rarely fail to go down with the public, although it is notorious that the first is a collection of vile daubs; the second, a parcel of worn-out trumpery; and the last a *pot-pourri* of hackneyed negro melodies and played-out street-ditties. In this way *slang* is metamorphosed into wit; immodesty, into artistic grace; impudence, into talent; *la première danseuse*, into a divinity; the poor, underpaid *figurantes* and *coryphées*, into angels; and the whole tinsel-bedizened, flaring spectacle, into a veritable glimpse of fairy-land. These are some of the consummations achieved by advertising.

Besides all this, there is a class of harpies who live more or less by their wits, and they find advertising often a profitable and remunerative game. "Astrological divinings," "medical quackery," "matrimonial openings," "business chances," offered to "energetic young men, *possessed of a little capital*;" "fortunes may be realized, and full particulars sent on receipt of twenty-five cents"—are a few of the creations of these human vultures, together with the execrable "Personals" which disfigure and disgrace the columns of our journals—for it is needless to say that all these, without exception, emanate from the same objectionable *coterie*. It appears almost incredible that these devices should succeed, or even pay for the expense of advertising; but that they *do* appear, is the best proof that they *do* pay; and this is in itself a very strong argument in support of the position we assumed at the outset, namely, that we are, all of us, occasionally liable to be taken in.

It is not only in America that this system obtains. In England and elsewhere it is quite as rife as on this side of the Atlantic; in fact, it was only the other day we were informed, on good authority, that Mr. Willan, a gentleman now at the head of two mammoth establishments in London and Paris, has amassed his colossal fortune within the last ten years, having, in that incredibly short space of time, risen to his present position of almost fabulous wealth from that of a common bill-poster, earning his daily wages with his brush and paste-pot! He now has the almost entire monopoly of that business in both the British and French metropolis, as well as on all the railroads and principal towns in both countries.

Advertising, from a mere convenience, has become a positive necessity, as well as a nuisance. Stages, cars, steamboats, railroad depots, dead-walls, and boardings, are plastered over and actually papered with bills large and small, round and square, long and short: bills red, yellow, green, blue, and all the colors of the rainbow; nay, even the very rocks, stones, and stumps, are called into requisition; and, while these herald forth the praises of "Buchn" and the superior excellence of some cheap sensational periodical, we have a complete and literal realization of "tongues in trees, . . . sermons in stones, and" puffs "in every thing!" It is, indeed, puff, puff, puff, everywhere. We walk upon puffs, for the very sidewalks are

stencilled with them; we rub shoulders with them, for there are living, peripatetic puff-mediums as well, with their clothes literally puffed with scarlet-and-gold letters; the air is full of them; they hang suspended across the roadway; they stream from the tops of lofty flag-staffs; they float from advertising-balloons, and descend in fleecy showers from the roofs of advertising-carriages; they are officiously crammed into our hand at every corner, into our pockets, or perchance even into our boots, if occasion offer; unfolding our morning paper, lo! a puff drops out of it, while the very piece of paper, which our obsequious barber lays on our shoulder to wipe his razor on, proves to be a puff of some abominable cosmetic, put there on purpose to stare us in the face and tempt us into reckless and unpardonable extravagance.

This system of advertising, we may observe, is a very ancient institution. It was known and in vogue more than two thousand years ago among the Romans, whose legal notices used to be "in publico proposita," or "posted," in the Forum and other frequented places, with slave auctions advertised in terms very similar to the notices which, until lately, were common in the journals of our own Southern States. But advertising, as a system, was, in primitive times, a purely legitimate one; of that there can be little doubt, and its degeneracy nowadays can only be accounted for by the tremendous business competition at present existing. The jostle for supremacy is unceasing, and there are many people only too ready to resort to the most unworthy means to gain one rung on the ladder to wealth or preferment. It is such men as these that have diverted advertising from its fair and legitimate aim, and, by trying to vie with and outdo each other, have been the means of transmogrifying the old into a new system altogether, which, if it extends its ramifications in a ratio approximating in any way to its progress during the last ten years, bids fair to reduce trade to a mere scramble, and the majority of our merchants and storekeepers to the grade of shifty charlatans and blatant "Cheap Johns."

JOHN ROBERTSON.

GUTTER-CHILDREN.

THE little town of Niagara, at the mouth of the great river of that name, can boast of beauties and attractions of a rare kind. There is the mighty lake with its ever-changing hues, rivalling in variety of colors the far-famed Lake of Geneva; there is the deep-green river rolling its mighty flood for miles into the great deep, and yet marking its boundary lines as with the painter's brush. On the left rise the romantic ruins of an old British fort and its huge tower, which the strange keeper, a boy of ten years, opens by climbing up a lightning-rod on the outside, and then letting himself down by a rope into the keep. On the right, and across the river, lies the American fort, with its still older and quainter block-house, once the scene of many a fray during Indian warfares, and afterward still more renowned as the scene of the murder of Morgan, the freemason. To this day sentinels tremble when in a stormy night they walk the ramparts and hear from the raging breakers the voice of the unfortunate man, and officers have to listen to many a weird tale, how his shadow, wearing an expression of unspeakable woe, came across the sergeant at night and pointed with ghastly anguish at the postern through which he was taken to his violent death. Even the great general's wife, who now stops at that most charming of summer resorts, the Royal Hotel, and from its broad balcony looks at the fort, where she lived, long years ago, with her young husband, even she can tell of the foolish challenge she once accepted, to walk unattended at night from the old block-house to her distant quarters—how she went boldly and bravely through dismal rooms and dark yards, till she reached the narrow passage, with its worn-out stone steps, that led to her rooms—how the candle that was kept at the upper landing-place suddenly flared up, flickered a while, and then left her in utter darkness—how she stumbled on till she heard something panting behind her, a faint breath came to her trembling cheeks, and then a cold, clammy touch made her hand quiver with nervous tremor—how she fell almost senseless on the uppermost steps, and did not rally till her husband's heavy tread was heard, and made her ashamed of her fear—how she rushed, with a great effort, into her room, seized a book, sat down by the table, and received him with apparent calmness, till the dog's cold nose, touching her once more, set her laughing heartily, and then made her sink to the floor fainting.

If you walk through the clean, well-shaded streets, in which once the towering forms of Southern exiles—of Mason, Slidell, Breckinridge, and Preston—were daily seen, and follow the pleasant plank-walk that stretches for miles in the direction of the Falls, you come soon to a stately building, not unlike a genuine West-India cottage, with its many bright windows, its broad verandas on all sides, and its well-kept gardens. You ask the gray-haired keeper, who courteously opens the gate for you, what house this is, and marvel as he replies, with a respectful smile, "The county jail, sir!" Surely, you think, these Canucks, as they are familiarly styled, take excellent care of their criminals! but your mistake is soon corrected by another strange sight. A little girl, barely eight years old, comes running up to you with a bright smile and blooming cheeks, and, dropping an old-fashioned courtesy, asks if you would like to walk in. As you stand and ponder the odd invitation to walk into a jail, you notice that, on the breast of the little girl's plain woollen dress, a paper is fastened, with the words:

"ANNA MARIA LELAND,

"Our Western Home.

"For Mr. John Galton Debar,

"570 Fulton Street, New York, U. S."

That child is a "gutter-child," the house is "Our Western Home," and its owner is one of the most remarkable women of our age. As you approach the front door, around which quite a number of little girls are clustering, like bees around their hive, you see in their midst a small, plainly-dressed lady, with a face, the only charm of which is a marvellously-clear, intelligent eye, full of good sense and resolution combined. Her whole appearance betokens, what we so sadly want in this country, a strong, unmistakable type. At the first glance you know and feel that you have an Englishwoman before you, strong and hearty in body and mind; a woman, moreover, who unmistakably bends all the power that God has given her to one great and good purpose.

This is Miss Maria S. Rye, who, struck with the terrible sufferings and the still more appalling temptations to which poor young women are exposed in the overcrowded cities of England, resolved one spring day last year to appeal, after invoking help from on high, to the benevolence of good men in behalf of her unfortunate sisters. She asked for the means to carry a hundred or more of such helpless women as found it impossible to earn an honest livelihood at home to distant Canada, where their labor was sure to meet a demand and to prove remunerative. The good heart of the British and the conviction of thoughtful men that here might be found one remedy at least for the fearfully-increasing pauperism of the empire, made the appeal successful beyond her expectations; she not only obtained the thousand pounds she had asked for, but as much more besides, and, with admirable energy she had, before the late spring opened a way to the frozen waters of Canada, collected one hundred young women, whom she carried over and instantly placed in good and permanent homes. But she soon saw, while pondering over the matter, that even more good might be done by applying the remedy at an earlier age, and taking over young children liable to be lost in body and soul by the miserable life they were leading in the slums and mews of great cities. Hence she proposed—and with her to propose and to execute seemed to be one—to gather young orphaned or worse than orphaned children literally from the gutters of London and other towns, and to open to them in a foreign land a way to an independent, blameless existence. In twenty-eight days, which was all the time she allowed herself to stay in England, she collected seventy-five children, nearly all orphan girls of from four to twelve years of age.

It was a stirring scene when the energetic young lady arrived at the wharf of Niagara with her little flock of precious souls to be saved. The good people from town and neighborhood flocked around the strange group with cordial welcome; farmers brought their wagons and carts, gentlemen their carriages, and even the poorest some little offering to give expression to their sympathy. Well might the heart of Miss Rye have swelled with pride as she saw the interest taken by old and young in her enterprise; but who can tell what must have passed in the minds and hearts of the poor little children, transplanted, as it were, by a magic wand, from extreme poverty and utter wretchedness to a land of plenty and an atmosphere of love?

In the mean time the town of Niagara had sold to Miss Rye the old jail, which after the purchase had been changed into a bright, comfortable, and well-ventilated house, for the comparatively small sum of

three thousand dollars. Capable of holding one hundred children and a moderate household, it afforded at once a pleasant home to the weary company; a benevolent manufacturer in England had supplied new bedsteads, bedding, and modest furniture for the whole house, as a token of his respect for Miss Rye; other kind hearts had furnished what was needed by the children, so that they not only were all well shod and clad warmly in woollen dresses, but had each, besides, a snug little wooden box, filled with a suitable outfit of clothing. Everywhere the greatest forethought, and the most active benevolence seemed to have gone hand in hand, and the outlying province of Canada had probably seen few more truly touching scenes than when the little orphans, after a short prayer, gathered round the supper-table, with its ample supplies and tempting delicacies, and, overcome by sympathetic excitement, were unable to eat, but rushed up to their "mother," fondling her, kissing her, and in every way striving artlessly to show her their gratitude.

After a few days the work of distribution began, and the special blessing that seemed to rest on the enterprise made itself manifest in this direction also. Sixteen of the little orphans were at once adopted by childless parents, and legally transferred to their new homes; the remainder were bound out till their eighteenth year. The people who take these children bind themselves, legally, to clothe, feed, and educate them, free of charge, till they are fifteen, and to see to it that they attend a place of worship on Sunday, and, if possible, a Sunday-school. From fifteen to seventeen they agree to give each child three dollars a month, in lieu of clothes, and four dollars a month during the last year of their apprenticeship. The children are ticketed and sent out by railway and river in charge of conductors or friends, many making the long journey to New York in this lonely manner—but not one has yet come to grief.

No sooner was the work accomplished, than Miss Rye began to renew her efforts. Having opened two hundred new homes in Canada and the States by personal interviews and a most extensive correspondence, she returned to England, all eagerness to continue the good work so auspiciously begun. She was examined by various official boards, and so satisfactory was the manner in which the money bestowed upon her had been expended, that voluntary contributions literally poured in from all sides, and, before the summer was over, she made a second trip across the Atlantic, bringing even a larger number of orphans to "Our Western Home." She now has good reason to expect that ere long she will be able, by help from on high, and the active benevolence of good men, to provide homes for thousands of poor, perishing children, and that in a way, to use her own words, "by which they may become useful, happy, and good Christian women, a blessing to themselves and to all around them." Who is there that will not thank her for rescuing, by her own great work, the much-slandered character of the girl of the period from unjust obloquy and sneering detraction, and wish her God's blessing on her noble and unassuming enterprise?

SCHELE DE VERE.

THE INVOLUNTARY SAM PATCH.

IT happened one day that a discussion arose in the natural philosophy class of Williams College, Berkshire, Massachusetts, on the question, "Why is it that, of the various victims carried over Niagara Falls, no trace of the bodies has ever been found, either in Niagara River or Lake Ontario?"

One student suggested that the fall itself was sufficient to dash to atoms any body whatever; another thought that the weight of water could not but keep the body effectually down in the crannies of the abyss below the precipice; and the idea of a third was, that the numerous fishes tenanted the deep pool, when favored with a stray corpse now and then, would leave slender chance for "contingent remainders."

The genial professor, after hearing the various theories of his young philosophers, said that he would not advance one of his own, but that, in humble imitation of a greater man, he would tell them a "little story," which might possibly throw a ray of light upon the subject:

"In my early days," he continued, "I was one of the teachers in an academy of Berkshire. A pleasant stream flowed past the village, and, on Saturday afternoons, it was an agreeable recreation to

walk along its banks for a few miles, until I could see its head-waters issue from the side of a steep hill which bounded the prospect. Crossing the stream, by a bridge opposite the school-house, I wandered one hot July afternoon up the left bank for nearly two miles, where it takes a sudden turn, bringing the wayfarer by its circuitous windings within easy reach of my starting-point.

"Feeling tired, and the stream being here very narrow, I resolved to ford it and save my distance. There is a water-fall at this spot, and below it a broad expanse of water, clear and shallow, except immediately underneath the shoot, where the depth is about twelve or fourteen feet. Marching up the bank about two rods, I divested myself of shoes and stockings, which I took in my hand and prepared to cross. Four steps would land me on the other side. The run was scarcely a foot deep, and a slippery green moss, somewhat smoothed by the current, lined its bed invitingly. I threw out a good stout leg, and planted one foot on the silky verdure.

"Did I say planted? I received instantar a lesson in dynamics on which I had not calculated, and which may save the dignity and the equilibrium of future topographical engineers.

"In the twinkling of an eye the force of the current had swept me off, and I was whirled down, helpless as an infant, to the falls below. Even in the moment of toppling, I kept perfectly cool, and never during the accident lost presence of mind. Fear I had none. I was a powerful swimmer; there were no rocks, as I well knew, and, before I reached the verge, so rapid are the operations of the mind, my course was clearly marked out. As soon as I plumped into the pool, I would float to the surface, make for the shore, have a hearty laugh at my mishap, and enliven my fellow-teachers with a gay recital of it on my return.

"Over I went very comfortably, and, that I reached the pebbly bottom, you may pretty safely assume.

"But, to my exceeding surprise, I found that floating up, though I was several yards out of the torrent's reach, was quite another affair. I abandoned my stockings and shoes, to which I had clung in my headlong descent, and struck out with might and main, but to no purpose—I could not rise! I knew that I was sound in wind and limb, and felt no superincumbent weight pressing me down. I struck out and kicked vigorously in the approved way, but, no sooner did I progress three or four inches upward, than a sort of magnetic attraction, gentle but irresistible, drew my toes down to their old resting-place.

"It was an incomprehensible 'fix.' I redoubled my efforts, and again, and again, and again, with a similar result. The case was becoming desperate. Was I really doomed to die in this wretched hole, about as pitiful a *finale* for a sophomore as Clarence's in the malmsey-butt? Ophelia's slip, Schiller's diver in the 'innermost main,' and Sam Patch's unlucky jump, all crowded upon my imagination, now preternaturally alert. I would have sighed, but for lack of oxygen, that no friends were to stand sorrowing around my dying bed, stepping with decorous woe behind my remains, and shedding tears by wholesale.

"Worst of all, I fancied my chum's unsophisticated lament in the rear of my hearse:

"Ah, poor Sam! our best swimmer, to be drowned at last like a blind puppy!"

"Visions, moreover, of muskrats gnawing my flesh, and ravenous pikes darting their long noses into the sockets of my eyes, certainly did not tend to raise my spirits.

"By this time I was nearly paralyzed through sheer exhaustion, and felt but too surely that endurance had reached its limit. One more terrible struggle, and alas! my plight was worse than ever. Noises as of a thousand cannon were ringing in my ears, and I fancied that blood was beginning to start from my mouth and nostrils. Will you believe me when I say that I was literally in a cold sweat?

"At this crisis, when I had made up my mind for the worst, it occurred to me that, if I could not rise, I might be able to walk or creep below water, and thus manage to reach the brink, which was at no great distance. It was a heaven-sent inspiration, and acted on without an instant's delay. I found to my joy that there was no hinderance whatever to this mode of progression, and, crawling along the bottom, like a crab, in less than twenty seconds my dripping head emerged from the treacherous bath, and I was once more respiring the warm summer air. I was saved!

"Throwing myself on the grass with unutterable thankfulness, I rested for a few minutes, and then deliberately waded in again to recover the shoes and stockings I had left behind, which was easily accomplished; so you see, my friends, that, with perseverance, 'some things may be done as well as others!'

"Now, gentlemen, why was it that I could not rise or swim in that water?

"The dashing of the torrent had raised so many foam-bells, and so infiltrated a denser element with air, that the specific gravity of the water was totally changed, and I might as soon have attempted to float on oil or champagne as on that sparkling current.

"The strongest fish that ever swam the ocean would be powerless to rise from the abyss of Niagara!"

ALEXANDER LATTO.

ORATOR—IMPERATOR.

FEBRUARY, 1871.

A SOUND of weeping surged and swept and rose along the nave;

It caught the groinings of the roof, and made the echoes rave;

Sad, like an empty helmet, seemed a silent pulpit's calm

Amid the sobs that choked thine aisles, magnificent Notre-Dame!

For he was dead who oft had made thy vaulted echoes ring;
Who swayed a vocal sceptre there, more splendid than a king.
Well might the wailing rise and fall, and rise again in air,
Where voiceless, in his cloistered grave, lay potent Lacordaire.

Soon other sounds of grief shall break that mighty church's rest—
The stride of hostile hosts shall shake the land from east to west.
Look! strangled, in a sea of blood, the struggling city falls,
And queenly Paris dies beneath those old cathedral walls!

Her Cæsar and her armies gone—the foe within her streets!
Another emperor now his clattering legions greets—
The shrouded orator lies still, nor sign of umbrage gives;
For, whether Cæsar rise or fall—Demosthenes still lives!

MALCOLM MACEUEN.

THE AMERICAN TRAPPER.

WITH ILLUSTRATIONS BY CARY.

AMONG even intelligent people, the ideas generally entertained about the character and mode of life of the American trapper are romantic and inaccurate, in very much the same way as the mistaken notions which prevail concerning the American Indian. For many years, Cooper's "Leatherstocking" was the typical trapper and hunter. Tall and spare, but lithe and sinewy; clad in buckskin for the outer man, and wrapped in the robe of a self-approving conscience for the comfort of the inner; grave, taciturn, and sententious; full of wisdom, from his long communings with Nature; tender-hearted as a woman to his own race, but a little flinty in regard to the redskins; profoundly versed in the habits and ways of all the wild animals of the American forests, as well as in every description of woodlore, yet secretly preferring to draw a bead on a crafty, tricky Indian, to the successful slaughter of a moose, a bull-buffalo, or even a grizzly—such was the trapper which the great American novelist had evoked from his inner consciousness.

This species of the trapper genus never had an actual existence, although so popular with novel-readers; but there have been approximations to it in the early history of our country, when the frontiersman was of necessity a trapper, a hunter, and prairie-scout, all in one. After Fremont's first and second expeditions across the continent, we began to become acquainted, through his fascinating narratives, with a somewhat different class of hunters and trappers, or, rather, with several classes. Of one of these, Kit Carson was the type—a brave but modest frontiersman, learned in all woodcraft,

quick of eye and hand, with all his senses alert, from the thousand perils he had encountered, not an admirer of the "noble savage" whom he had more than once met in deadly conflict, yet ready to do justice to his good qualities; a man of wonderfully tenacious memory of topography, an excellent shot, but of too large a mould, intellectually, to devote himself exclusively to the snaring or capture of the wild beasts of the Rocky-Mountain region.

We learned also, from these narratives and other sources, something of two other classes of hunters and trappers, men skilled, indeed, in the arts of securing game, but in morals and intelligence decidedly below the brave and manly Carson. To the first of these classes belonged such men as Leroux and Beckwourth, men not remarkable for saintliness, but who had added the Indian shrewdness and cunning to some of the vices of frontier civilization. These, however, though profane and usually addicted to intemperance, and having their squaw concubines in various localities, were not by any means the worst of the frontiersmen; they were not cowardly or brutal, and took a sort of pride in maintaining their business engagements at whatever hazard. A worse class were those ruffians of the border with whom hunting and trapping were a pastime, and murder and highway-robbery the serious business of their lives; men who would shoot down an Indian or a "greaser" (a Mexican) as readily as they would a prairie-dog, and with as little provocation; hardened outlaws and villains, whom no tenderness could influence, no kindness subdue; cowards and bullies, with whom no man's life was safe unless his superior courage and skill enabled him to hold them at his mercy. These were the men whom Pumpelly and Captain Malines describe so graphically, fiends rather than men, since they seemed to have lost every trace of humanity.

But, though all of these classes which we have described may have had some claim to be reckoned among American hunters and trappers, none of them fairly represent the typical trapper of the past thirty or fifty years. The trapper of the Northwest (for so rapid has been the progress of settlement that the vast region of "the Plains" and the slopes of the Rocky Mountains, in Colorado, Wyoming, and Utah, are comparatively little frequented by the trapper, as, indeed, with the exception of the bison and the antelope, the larger game, as well as most of the fur-bearing animals, have disappeared, or become scarce in the whole tract) now finds his quarry in Dakota, Montana, Idaho, Washington, and Oregon, of our territory in the Red-River region, the Hudson's-Bay country, and British Columbia and Vancouver's Island, in British America. The majority of the trappers of the present day are either Canadian-French or half-breeds (French and Indian) by birth. They have been brought up from childhood to their vocation, and would not be contented in any other. Generally not above the medium height, and often below it, with the vivacity and improvidence of the Canadian *habitant*, usually kind-hearted and affectionate, but sometimes, when under the influence of intoxicating liquors, to which they are much addicted, quarrelsome, or sulky and sullen, they are more like spoiled children than any thing else. They are great boasters, and in the narratives of their hair-breadth 'scapes and wonderful adventures, which they are very fond of recounting, they are themselves the heroes and demi-gods. Extraordinary, indeed, are their achievements, if their word can be believed. The mountains they have climbed, the rapids they have shot in their birch canoes, the terrible conflicts they have had with grizzly bears, panthers, enraged buffalo-bulls, or the combative moose or elk, and in some instances with Indians, have been so wonderful as almost to rival Münchhausen. Yet, with all their boastful and lying propensities, they have many good qualities; they are active, patient under toil, exposure, and hardship, versed in all the mysteries of woodcraft and the arts of the trapper, ingenious and full of expedients, generous and reckless in their expenditure when they have received the pay for their peltries, helpful and kind-hearted, ready to do any thing for a comrade, even to the borrowing of his last shirt or his only hatchet, always in debt, yet always full of hope that their next season's trapping and hunting will somehow enable them to pay off old scores and retire from the trapper's life in affluence. In their relations with the other sex, they are generally sad reprobates; and though their stories of their triumphs are not to be implicitly believed, yet the rascals have such glib tongues and so many of the arts of the flatterer, that they seldom fail to lead astray the Indian and half-breed maidens with whom they come in contact.

The uniform mediocrity of their character is remarkable. Among

THE AMERICAN TRAPPER.

THE CANADIAN HALF-BREED TRAPPER.

the thousands of them, in the north and northwest portions of our continent, we have never heard of one who had emerged from the dead level of the trapper's life, and attained to any distinction or even notoriety. They are as like each other as the peas in a pod. One may be a little more worthless, a little deeper in debt, or a little more of a vagabond than another, but there is no other difference. Ambition, indeed, seems not to be a trait in the character of the trapper. Other races and classes, as illiterate as he, have yet startled the world by occasional men of genius, who have lifted themselves above the common head; but Jean, the trapper, apparently will never be other than the good-natured, good-for-nothing vagabond that he always has been and now is.

SKETCHES OF SERVIA.

WHAT Moscow is to the Russians, Kraguyevatz is to the Servians—the popular, though not the official capital. But, instead of deriving its importance from a hoary past, it owes it to the latest period of the country's history, to the period of her regeneration. Prince Milosh Obrenovitch, who, in 1815, successfully renewed the work of her deliverance begun by Kara George, made it his seat of government on account of its natural position. Here, at a considerable distance from the Turkish cannon which then frowned down from the bastions of Belgrade, the Serbs could hold undisturbed their great national gatherings. Here they were sheltered by their mountains, and protected by the tried valor of the sons of the Shumadia, their central forest-land. Prince Alexander Kara-Georgevitch, some decades later, established here extensive artillery workshops, in which hundreds of guns, arms of every kind, and large quantities of ammunition, were manufactured, destined to serve in future struggles for a more perfect independence. Kraguyevatz thus became Serbia's foremost place of arms—the popular centre of her warlike people.

Its external appearance, however, by no means corresponds with its importance. Looking down, westward, from the high summit of the Tzerni-Ver, you descry it on a handsome mountain-girt plateau, its red roofs shining out from among trees richly laden with foliage. But you look in vain for any thing striking, indicative from afar of a great city. Your eye beholds neither turret nor cupola. Where stands the capitol of the regenerated nation? Where rises the palace of its prince? Neither can be discerned. We enter the town. A neatly-built wooden bridge over the Lepenitz, a western affluent of the Morava, carries us into it. In front of the bridge rises a small, crumbling mosque, whose minaret has long disappeared. Beyond it lies the gypsy-quarter, which is very dirty, as gypsy-quarters always are everywhere. Near its end begins the broad Tcharshia—the bazaar-street—which traverses the whole length of the town proper. Hardly any thing but a single wooden cross of large dimensions breaks the monotony of its rows of low shops and houses. Shop follows shop; shoemakers, tailors, belt-makers, merchants, vendors of provisions, crowd each other. At first glance it seems as if Kraguyevatz had to supply with goods a third part of Serbia. There is plenty of Austrian and English manufactures, distributed in tolerable order.

A narrow cross-street takes us to the Great Square, traversed by the Lepenitz, round which the main buildings of Kraguyevatz are grouped, though without a determined plan. The vast space offers a desolate aspect; a gloomy silence hovers over it, broken only by the dull, hollow sounds of the armorers' hammers, which reach us from the opposite river-bank. In the middle stands an isolated steeple of framework. By it the longitudinal, whitewashed, but entirely unornamented structure is known to be the main Greek orthodox church of the town. Hard by this church stands one of the national buildings we tried in vain to espy from the distant height—Serbia's capitol, a plain, frame structure. Prince Milosh erected it on his return from exile to the throne, in 1859, to serve as the provisional seat of the great national Skupshtina (Assembly) convoked by him. His son, the late Prince Michael, held here the memorable Preobrashevska Skupshtina (Assembly of the Transfiguration), so called from the holiday upon which it opened, and whose resolutions, vigorously supported by the attitude assumed toward the Sublime Porte by both prince and people, contributed no little to the gradual transformation of Serbia into a free and constitutional country.

To the right of the Skupshtina-house, a high palisade encloses

a number of princely and government buildings, among them the arsenals with their mounted cannon. Two high gates, guarded by infantry, open into a large square. At the sides of the entrance stand two buildings in old Turkish style—the *konaks* (mansions) of Prince Milosh and his wife, Lyubitza. A pillared vestibule, adorned with a lion resting on a high pedestal—a work of ancient Roman art—leads into that of Milosh. The veranda of the first story offers a charming vista. It is furnished with low cushioned seats, and was the favorite resting-place of the old prince. Here he used to sit with his *knezes* (chieftains), in later times with his ministers, deliberating on the affairs of the country; here he received and talked with his Lyubitza and her little princes, Milan and Michael; here he gave unceremonious receptions to all callers. Here he inhaled the free air of the mountains, and looked with delight at the games of his youth, at the lively *kolo* (round dance), which the blooming daughters of Kraguyevatz danced before him on the verdant lawn below. The rooms of the konak are furnished in the Oriental way, with ottomans and pipe-stands, with beautiful carpets and a variety of paintings. Every thing is marked by that profusion of shapes and colors and that irregularity of Saracenic zigzag ornamentation which, though devoid of the pure lines of the classical styles, never fail pleasantly to affect the eye of the European beholder. Prince Milosh had a particular fondness for portraits of celebrated men, and the walls of his konak were lined with more or less skilfully-executed likenesses of scholars and divines, statesmen and generals, champions of freedom and absolute monarchs.

Had circumstances allowed it, Milosh would have fain transferred his seat of government altogether to Kraguyevatz. Unable to carry out this cherished design, he yet spent a large portion of his time in that town, hallowed by the dearest of his remembrances. For hours and hours he looked at the exercises of his artillery on the spacious grounds before the konak. When, on that memorable Palm Sunday of 1815, he once more declared war on the Turks he had not a single piece of cannon. He had to conquer his guns from the foe. There they are preserved now—in the depot on the side of Lyubitza's konak—those firstlings of Serbian artillery, procured at a heavy price of blood! Near them, in the adjoining wooden barracks, Milosh could count, in the last years of his life, about two hundred similar engines of death, all cast from the native ore of the land, and wrought and mounted by the native skill of its sons. What a sight for the deliverer of his people!

The konak of the Princess Lyubitza has been preserved in its original order. At the entrance, above the main door, we perceive the name of the sultan, in richly-ornamented signature style—the erection of the mansion belonging to that early period in Milosh's career in which he still considered himself a lieutenant of the Padishah, and Turkish governor of the "Eyalet of Serb," rather than one of the European princes. The paintings which cover the walls, both in choice and execution, betray truly naïve conceptions. Turkish and Hungarian horsemen, singly or in group; idyllic landscapes, the correctness of which could by no means stand the test of scientific examination; scenes of adventurous love, and scenes of deadly shocks in arms—all encased in ornamentations of the oddest kind—alternate with each other in admired disorder. In the bedroom of the princess the picture of a blessing hand extended from among the clouds, attracts our attention; above it, we read the words, "The hand of the Lord blesses little Milan." The furniture of the konak is now reduced to a few beautifully-worked shrines in the Ottoman style. The large garden adjoining the mansion is neglected. When Lyubitza was there, it won the admiration of all by its profusion and beauty of its flowers, which she raised and guarded with fond carefulness.

Between the konaks and barracks is the cannon-casting establishment. Without entering it, which can be done only by special permission, we easily perceive by the smoke rising from the forges, by the roar of the steam-engines, and the din of the laboring men, and especially by the heaps and pyramids of rifled and unrifled gun-barrels in front of the building, that Serbia is not idle in providing efficient implements of defence or aggression for not unforeseen future contests. The spacious court of the barracks now and then offers rather interesting sights—as, for instance, when you see the young soldiers, picturesquely grouped around a well, taking their evening meal on the green lawn; or see them, in the ensuing twilight, dancing the *kolo* at the sound of the "Paratchka," a melody no less inspiring to the Serbs than the "Csárdás" to the Magyars. The circle in-

creases from moment to moment, the energy of the fifer grows with that of the dancers, and all is mirth and youthful excitement until the sounds of the tattoo are heard, and all retire to rest, and darkness and stillness cover the scene.

VRATCHEVSHNITZA.

A little west of Kraguyevatz, almost in the very centre of Serbia, stands the old monastery of Vratchevshnitza. The root of this name is *vratiti*, to return, and tradition explains why it was bestowed on the monastery.

In June, 1889, one of the noble vassals of Tzar Lazarus, having left his castle—perhaps the neighboring Ostrovatz, perched on a cone-shaped mountain—was hastening at the head of his band of warriors to join the army which that Serbian prince led against Sultan Murad, to fight the deadly battle of the Cross with the Crescent. He had scarcely marched a few hours when the thought sank heavy upon his soul that, in his zeal to depart, he had forgotten to hear mass that morning. It appeared to him like having wantonly thrown away the protection of the saints at the very hour when it was so much needed for the holy cause. He returned, prayed fervently to the Lord of hosts, and started anew with renewed faith. It was too late to save the fatherland. Fugitive Serb horsemen, hotly pursued by Moslem foes, soon announced to him that the great battle had been fought and lost. Tzar Lazarus had perished in the battle of the Blackbird Field (Kosovo), and with him Serbia's freedom for centuries. But the delay had saved the pious knight's life, which he would have in vain sacrificed in the unequal contest. Devoutly thankful for his own salvation, he vowed to commemorate it and its cause, and, when the first floods of desolation had passed over his unfortunate country, he returned to the spot where he had remembered the forgotten mass, and there erected a monastery, which he called Vratchevshnitza.

But it is not this tradition alone which has rendered this monastery sacred in the eyes of the Serbian nation. It is still more hallowed by the great part it acted in our century in the struggle for national resurrection. For here was consecrated the covenant between religion and nationality, between priesthood and patriotism, which led to victory in that struggle. Melentie, the Archimandrite of Vratchevshnitza, was the first to put himself, armed with cross and sword, at the head of the warlike host, which, on the Palm-Sunday of 1815, gathered around Knez Milosh at Takovo, once more to strike for independence. It was to be a hard and bloody conflict, but the leaders and their followers shrank not from the task, and Kosovo was avenged.

Like most of the Serbian monasteries, Vratchevshnitza lies in a deep glen. The traveller, coming from the east, perceives it only when reaching its gate. The church, a plain basilica, corresponds in style to the age in which the legend places its erection. The frescoes in the interior belong to the rare church-ornaments of that kind and age which have escaped the ravages of Ottoman fanaticism. Opposite the north wall of the church stands a handsome one-story building, erected by Milosh, in the style of the princely Konak of Kraguyedatz. He spent many a day within the peaceful precincts of Vratchevshnitza. Besides the remembrance of the noblest deeds of his youth, they guarded the remains of his mother. On his return, in 1859, after twenty years of exile, he bestowed a great deal of care upon its humble church, which he intended to make the burial-church of his house, where he would rest side by side with his mother and with Melentie, his priestly companion-in-arms, surrounded by the free summits of the beloved forest-land. The prince's architect made the necessary changes and additions, and the crypt of the Obrenovitches was constructed; but, when Milosh died, in 1860, Prince Michael had him interred in the cathedral of Belgrade, while the remains of Lyubitzza were left in her foreign tomb, among the hills of Fruska Gora, in the Hungarian military frontierland.

Among the few curiosities of Vratchevshnitza is an original picture of the brave Melentie, a work of primitive art, but of no mean conception. The muscular features of the hero are expressive of energy and noble manliness. In his sparkling eyes and on his well-cut lips one almost reads the words, "I will no longer be the priest of outcast *rayahs*, of a herd of slaves!" Milosh Obrenovitch, it is well known, understood the art of punishing; but he also knew how to reward. Having made the Church of Serbia independent of the Patriarchate of Constantinople, he appointed Melentie its first national archbishop.

West of Vratchevshnitza, in a pleasant valley of the Rudnik mountain-range, lies the neat village of Tzernutche. In this quiet and sheltered valley Knez Milosh sought refuge after the disastrous war of 1813, when Kara George, in hasty despair, had given up the cause of his country and fled to Austria, and every hope of continuing the struggle seemed delusive. On an eminence overlooking the village are seen the two houses then occupied by Milosh's family. They are built in Swiss rustic style. A dense forest slopes down to their very flanks from overtopping heights; under them extend meadows, rich fields, and orchards. In the shade of a large apple-tree Milosh often talked with his intimate followers of the deplorable fate that had befallen his country. Its cries of despair disturbed his slumbers. It was from Tzernutche that he marched to Takovo on the Palm-Sunday of 1815.

North of Tzernutche, on the other side of the main branch of the Rudnik range, lies Topola, the native home of Kara George. The village and its surroundings, seen in the blooming season of the year, offer charming aspects. Magnificent beeches and oaks adorn the hills, blossoming trees and shrubs embellish and perfume the valleys. Topola is partly situated on a plateau. From one of its heights, then covered with dense woods, Kara George looked down, in 1804, upon the flames which, kindled by the bloody hand of the Janizaries, devoured the house of his parents; and there he vowed terrible vengeance upon the heads of the oppressors. Thus Topola may be regarded as the cradle of Serbian independence. It was the favorite rural abode of Prince Alexander, the son of Kara George, who built there a mansion enclosed by high turreted walls. A garden with hot-houses adjoins the building. Near by, on a gentle slope, stand the school-house and the church of the village. The church is small and narrow; the light of the sun scarcely can penetrate through its little windows. But there burns within the eternal lamp. Its dim ray falls upon a red-marble slab in the right corner near the entrance. This slab covers the bones and the detached skull—once ignominiously fastened to the gate of the Seraglio in Stamboul—of the hero of the forest mountains, the leader in the first rising of the Serbs, the "liberator of Serbia," the far-famed Kara George. To the left of the entrance, opposite the resting-place of their ancestor, several members of that princely family lie buried. Their tombstones are richer than his, and decorated with long inscriptions and princely emblems.

So near each other are the burial-places of the two dynastic houses whose history is the history of Serbia in this century; houses founded by men of equally humble origin and equally energetic character, but of diverse abilities. For more than half a century these houses—though both justly claiming the gratitude of their nation for signal services—have lived in constant and deadly hostility to each other, alternately the one on the throne and the other in exile. The catastrophes have been frequent on both sides; but the longer periods of prosperity have thus far fallen to the lot of the Obrenovitches, while the house of Kara George, who was himself treacherously slain, seems to be doomed to taste the bitterest fruits of ambition, and but briefly to enjoy the sweets of power.

M. HEILPRIN

A DAY ON MONT CENIS.

AS the completion of the Mont-Cenis Tunnel obviates for the future the necessity of travel across this dangerous winter pass, either by *diligence* or by the "Railway Fell," it may not be uninteresting to the reader to hear of my adventures there a year ago.

It was two o'clock on a February morning when I was awakened from a cosy nap in the comfortable bed of No. —, Hotel Europa, Turin, to the fact of its being time to get up and begin my journey to Paris. Cold and sleepy, I made my preparations for departure, and could not avoid expressing a wish to return to bed and give up the journey, although my husband was drawing a most fascinating picture of the beauties of Alpine scenery in winter. These raptures did not excite my enthusiasm as they might have done two months before, for since then I had crossed at the Brenner Pass. Besides, I wished to journey more leisurely toward the gay French capital, *via* the Corniche Road. This wish was accomplished, but by a train of adventures, or rather misadventures, which I am about to narrate.

We found ourselves breakfasting at the little railway-inn at Susa

in the gray twilight which just rendered visible the snow on the mountains, at whose base Susa lies. Our short journey from Turin to this point, by dint of dozing, with the aid of hot-water cans at our feet, had been comfortable enough, but my courage—none the strongest—oozed out entirely, as at the call to leave we stood on the platform and looked up the mountain-sides, which we were literally to climb in a steam-car.

This railway has been constructed within the past four years, in accordance with the system of the American engineer Fell. It runs parallel with the high-road, and, besides the ordinary rails, is provided with another of higher level in the middle, against which horizontally-placed wheels work, in order to increase the friction. The capabilities of this novel conveyance over a mountain-pass are necessarily limited.

We were hurried into a single small car, with seats like an omnibus. Besides ourselves, there were only four persons, a lady and three gentlemen. We found the car quite comfortably warmed by the hot-water cans which constitute the usual method of heating railway-carriages abroad.

The ascent commenced abruptly, and, by the time we were snugly ensconced beneath rug and Austrian blanket, the first rays of the rising sun were visible, and such a scene of gorgeous grandeur was presented to our eyes as I never imagined. Far above the range of vision towered the mountains, peak upon peak, glowing in a deep-red light more vivid than the red of the aurora borealis. The effect of the light upon the snow-clad scene was beyond description; the rugged mountain-sides, the lofty peaks, the valleys, the gorges and chasms, all reflecting it in every shade of dazzling color. We forgot cold and danger, and were lost in awed admiration; all sprang to their feet and gazed out, while exclamations fell from the lips of each passenger, betraying nearly as many different nationalities. Guido, I am sure, could not have painted his "Aurora," the pride of the Rospigliosi Palace in Rome, if he had never been in Italy. The inspiring beauties of a sunrise in the Alps and along the shores of the Mediterranean must have been in his mind.

As the chariot of the "sun-god" mounted higher, the "rosy-fingered goddess" gradually disappeared, and, under the less romantic light of broad day, we began to realize the fact that, although the day was bright, the open windows and door of our queer Alpine conveyance made a temperature too low for even enthusiastic tourists to keep warm in. We closed the windows and settled down again beneath our wrappings, and, with leisure and light, looked at our *compagnons de voyage*. The lady, giving her the precedence of the sex, was quite pretty, very stylish, and had the air of elegance and refinement which marks the lady of any land. The coronet on kerchief and bag gave a hint as to her position in society. In the course of the day, after we had made friends through a conversation in bad Italian on our part, and, I flatter myself, worse English on hers, we found her to be a Genoese countess, journeying with her husband to Paris for "the season." The count was young, handsome, and so fair and so quiet that I at first mistook him for an Englishman. The undress uniform of the gentleman beside me indicated him as an officer of Victor Emmanuel's army. He was handsome, gay, good-humored, and polite, though more reserved than the Frenchman opposite, who chattered and gesticulated regardless of answer or attention. The latter found our vicinity unsociable, and soon moved near the countess, with whom he kept up an incessant conversation, carried on in a language which was a curious mixture of French, Italian, and pantomime.

We steamed along briskly, traversing the valley of the Dora Riparia, and, after passing Molaret, a small Piedmontese village, began a steep ascent. The little car seemed actually to labor as it crawled up the mountain-side. The guide-books tell us that the chestnut, mulberry, and fig, flourish on these mountain-slopes. I remember nothing but snow—mountains of snow—snow deeper and deeper as we climbed higher. However, we went along safely, reaching the small plain of St. Nicholas, and traversing it in a straight direction. We obtained glimpses as we passed of the villages of Novalesa and Ferrera. Then there rose into view the picturesque mountain Rocciamelone, crowned by the chapel of Notre-Dame des Neiges, formerly much frequented, but now falling to decay.

My husband about this time amused himself with laughing at me for my apprehensions of the morning, and my desire to escape this ascent, reminding me that women were cowards, and insisting that I

should be very grateful for his determined advocacy of the trip, since we had been already repaid by the beauties of the scene. I meekly—for me—remarked, "The journey is not over."

After crossing the plain St. Nicholas, the ascent again commenced, steeper than before; the houses of refuge were more frequent, and the snow deeper. It had been quite calm when we left Susa, but now a furious wind prevailed. As I looked at the little zigzag line of railway, the sharp curves around the edges of precipices, and the sheer descent of hundreds of feet, I began to wish that we were safely lodged at San Michele, on the other side of the mountain. Slowly, more slowly, we crept along, then suddenly we stopped. I looked ahead—the track was nowhere visible; it was, in fact, entirely covered with snow, the wind causing great masses to drift down from the surrounding peaks. Before we could comment upon our situation, a long line of workmen, looking like animated rag-bags in their various mufflers, were at work clearing the track. As they would clear away the drifts, we would move forward, and stop again when similarly obstructed. This continued for some time, the wind-storm increasing every moment. We had made five or six stoppages of this kind, and were again moving on amid roaring wind and hurtling snow, when the car suddenly began to rock and shake, and seemed to be turning on one side. Every one exclaimed and sprang up. There was a screaming and jabbering in French and Italian, a grating noise, and, as the motion ceased, I heard some one say outside, "D—n it, he's let go!"

I never expected to feel pleased at the sound of an oath, and just then the idea of "letting go" was horribly suggestive, but it was nevertheless the most intense relief, amid the jargon about us, to hear some one, evidently in command, speaking English, however unsatisfactory the phrase might be. I grasped my husband's arm, and begged him to go to whoever was speaking English for an explanation of the situation. The countess was almost hysterical from fright, and the gentlemen lost in wondering what was the matter. My husband soon came in and informed us that we were snow-bound, but the additional information that our engineers were all Englishmen, and that they said it was "all right," consoled me very much. The chief soon entered and said that, although within four kilometres of the summit of the pass, we could not proceed; that the drifted snow might be removed in a few hours, but that the wind was so violent we should be blown over if we attempted to go on, and that we had just narrowly escaped this fate. As if to give point to this statement, half-way down the precipice, just in view, was the wreck of a freight-car, blown over a few days before. "Back to Susa!" was the cry. Alas! he politely, though with some indifference, informed us that the snow had drifted to such a depth in our rear, that to return for many hours, perhaps even days, was impossible. What a situation! Snowed up near the summit of Mont Cenis in a small railway-car that rocked—even at its moorings—with every blast of wind. Visions of avalanches, frozen travellers, San Bernard dogs, and a thousand other chilly images swept through my mind, while home, friends, and warm firesides, seemed forever out of reach. The hot-water cans had, in the mean time, cooled; and the situation, physically, was beginning to be truly painful. The wind roared and howled around our little shelter, and away up from mountain-top to mountain-top the echoes of the tempest seemed to answer back like evil spirits mocking our distress. Utterly broken down by cold, fatigue, and fear, I was, I believe, almost about to resign myself to death, when the engineer again came in and said that about twenty yards distant was a house of refuge, or small tavern, where we would find fire and other assistance. Muffling ourselves up in all the wraps we could muster, we started for the house. The snow was blown about in such tremendous masses, and with such violence, that it was several minutes before I could reach the welcome shelter, even with the aid of my husband and one of the engine-drivers. A miserable place it was, though we hailed it as a castle of security and comfort against the terrible storm. We entered a large, low-roofed room, with a huge fireplace and stove, smoke-stained and filthy; and sat down in the midst of train-hands and muleters, for it was directly on the high-road. Our attendants were two females: one wrinkled old crone, hideous to behold; the other a young woman, dwarfed and hunch-backed, with an immense *goitre*. Ugh! I shall never forget their appearance. In obedience to an inquiry if there were another room, she showed the countess and myself into a sort of closet adjoining the *grand salon*, containing a bed and a few toilet articles, all of the coarsest description. "Vera g-re-a-ble," said my companion, in her

broken English. "Horrible, if we stay here all night," thought I. As we returned to the outer room, thankful for a seat by the fire, we found the tobacco-smoke almost stinging, accompanied as it was by flavors of garlic which rose from a large pot or caldron over the fire. This was stirred from time to time by the hunchback, and as she stood amid the smoke, peering into the vessel, she might well have passed for one of Macbeth's witches. She ladled out the mess after a while, serving it to the railway hands and sledge-drivers. We declined taking any, and a search in our travelling-bag for something better brought to light a Strasbourg pie and some biscuit. The Frenchman, after a conference with the elder woman of the house, brought out a plate of frozen honey, which he handed to us in great glee, as a *recherché* dainty; my husband, who has a strong distaste for honey, advised me, with a gesture, and a nauseated expression of countenance, against eating any, but monsieur thought it delicious, and chattered away, as he dispatched it, in the gayest possible manner.

The English engineers were merry and boisterous, and their hardy courage and gay good-nature inspired me with great admiration. How much do we owe to men in positions like this, leading such a life as theirs must be! I have often thought of it on shipboard, on a rough night, as I have heard their cheery tones above the roar of the waves. Glad of an opportunity to hear our mother-tongue, we listened to and talked with them. I asked the chief how it was that this railway was being worked by Englishmen. He laughed, and replied that an American planned it, and Englishmen worked it, "for," said he, "these lazy Italians and good-for-nothing Frenchmen could never have accomplished it." And then, descending from ethnology and engineering to the substantial of life, he said to my husband, in a half-mirthful, half-pathetic tone, as he drained a great measure of the sour red country wine, "What wouldn't I give for a pot of stout!" I was struck with the hoarse sound of the voices of all these people, as well as with the inflamed look of their eyes. It seems to be the effect of the snow and cold, which, I was told, very often cause blindness and deafness.

After enduring our mountain imprisonment for about four hours, we were agreeably surprised by the information that the snow had been cleared away, and we could commence our return-trip to Susa. This was joyful news, and, with great alacrity, we bade farewell to our entertainers. They seemed rather gloomy at our departure, pocketing their fee with the usual "grazie," uttered in a tone which spoke of disappointed hopes of a longer stay and larger perquisites.

Our return-walk to the car was with difficulty accomplished, but at last we were settled, and with genuine delight began the descent. We went very rapidly down the mountain, each moment leaving the wind and snow farther behind. Every one laughed and talked, and made merry—every one except our whilom gay Frenchman, who, huddled up in a corner, with his hands clasped over his stomach, groaned and moaned with dyspepsia, and anon cursed and wished frozen honey where it should be, namely, at the top of Mont Cenis.

We all—with the exception of the officer—determined to return to Turin that night, and go to Paris by the route along the Mediterranean. He laughingly declared he would attempt the pass again the next day, and that he would arrive in Paris several days in advance of us, and order our rooms prepared. We arrived in Susa about sunset, and went on to Turin that night. Thus ended our Mont-Cenis trip. My husband, I may add, has been silent ever since about Alpine scenery.

A TYPHOON IN THE CHINA SEA.

IT was about the time of the autumnal equinox, and during the interval of changeable weather that intervenes between the regular monsoons in the China Sea, that my vessel, a bark, was making a passage from Shanghai to Hong-Kong. One night being very squally, with baffling winds, I remained on deck all the time, to see that advantage was taken of every slant of wind, for we were near the entrance of the Formosa Channel, and it was my wish to make all possible use of the southerly current that sets down through it. After breakfast, the weather appearing to be more settled, with a light breeze from southwest, and the barometer standing steady at about 30.5, I went below to make amends for the fatigue of the previous night, leaving the vessel under royals and staysails standing to the southward, with the starboard tacks aboard. The second mate, an

old and experienced seaman, familiar with the peculiar characteristics of wind and weather in those seas, had charge of the deck; and, being a man in whom entire confidence could be placed, I retired to my stateroom without any doubts or misgivings, and was soon asleep. I say asleep, but, although the body was at rest, my mind seemed conscious, and I remember to have heard the bell strike the half-hours, while the noises from the deck blended with my dreams.

At length I distinctly heard the cry of "Man overboard!" and was aware of an unusual noise and confusion, but made no effort to rouse myself until the steward ran into my room and gave me a call. Jumping from my berth and getting to the deck was but the work of a minute; and finding the bark in stays, as I supposed, with all the sails shaking, I called two of the men, and with the steward lowered down the lee-boat, and sent them off to the rescue of our shipmate.

It is a characteristic of the trained seaman, that when he first comes on deck he glances aloft, and then takes a look to windward before scanning the horizon, and by this peculiarity you can always select from any number of passengers those who are familiar with the sea. In this case, however, owing to the confusion of the accident, and the hurry of lowering the boat, I had neglected this usual survey of the ship. What was my surprise then, upon turning around, to find that the vessel was half a wreck! My first thought was, "I still am asleep and dreaming." There was scarcely any more wind than when I went below; but the foretop-mast was broken short off at the cap, having carried with it the maintop-gallant-mast; and the jib-boom was trailing alongside. The wreck of these spars in the water, with the sails attached, had acted as a drag in bringing the vessel's head to the wind, which was the reason that led me to suppose her in stays when I first came on deck at the call of the steward.

Hurrying forward where my officers were busily engaged making preparations to clear the wreck, I received from the second mate the following explanation:

Noticing a light bank of clouds on the weather-bow, while the wind was freshening slightly, he had clewed up the fore-royal, and sent one of the men aloft to furl it. He was then coming aft to take in the main-royal, when, without the slightest warning, there was a sudden crash, and the wreck that I saw before me had taken place, and the man on the royal-yard was thrown far to leeward when the mast went by the board. Aft, there had not been wind enough to blow the cap from the head of the man at the wheel, while the forward part of the vessel was enveloped in a sea of foam, that extended as far ahead and to leeward as he could see.

It was evident that we had been caught in the edge of a white squall that had swept diagonally across our bows, carrying away the head-spars, and, if we had been only one length farther ahead, every stick would have been taken over the side. There was no time, however, for conjecture or inaction. Upon going below, I found that the barometer was falling rapidly, and former experience assured me that this squall was the precursor of a typhoon, a most disagreeable assurance at any time, but much more so in our crippled condition.

Seeing that the men in the boat had not been successful in the object of their search, I made the signal of recall, as all hands were needed for the imperative duty of clearing up the wreck before night, and it was by this time after one P. M. We neither saw nor heard of our unfortunate shipmate again. It is probable that he was stunned by the shock of his fall, and, without a struggle, sunk to rise no more. He had only been with me about two weeks, and I knew nothing of his relatives or friends, excepting that they lived in some part of New England.

It is not necessary to particularly explain our labors, but all hands worked manfully and well, so that by sunset we had a spare top-gallant-mast rigged as a jury-foretop-mast. The wind was increasing to a gale, and veering gradually around to the northward and eastward. Through the night we labored along heavily, and were gladdened in the morning by the sight of the "White Dogs," a remarkable group of islands serving as a landmark for the port of Foochow. Under the lee of these islands we found a harbor, where, for three days, we rode out one of the heaviest typhoons it was ever my lot to experience. Fortunately, we had not much top-hammer to hold the wind.

Upon reaching port, several days afterward, I ascertained that many vessels had suffered more seriously than ourselves. A brig, which caught the gale about ten miles south of us, was totally dismasted, and at Tamsui and Tai-wan-foo, on the island of Formosa, a number were driven ashore.

H. W. DODGE.

TABLE-TALK.

ONE of our daily papers has been giving large space to a correspondence regarding matrimony, the discussion having arisen from a suggestion made by some one that American girls, in order to secure better prizes in the matrimonial market, should, after the European plan, carry dowries to their husbands. The correspondence elicited by this proposal has been extensive, varied, and has embraced pretty nearly the whole range of social subjects pertaining to the state of marriage. Communications have come from happy bachelors and forlorn bachelors, from contented Benedicts and pining Benedicts, from maidens of gentle temper and maidens of shrewish tendencies, from wives who bless their husbands and wives who evidently would like another opportunity, from widows who rejoice and widows who mourn, from widowers who sigh and widowers who are at peace, from men-haters and from women-haters—in short, from people representing every possible relationship to matrimony and every shade of sentiment. Of course, the correspondence has included a good deal of nonsense, but it has also been suggestive, and has served to show, not only the great difference of views that exists in regard to social questions pertaining to marriage, but as to the obstacles that keep men and women asunder. The young men complain of their inability to support wives in the style that women now expect to live, and assert that, if social custom is to continue demanding so much of young Benedicts, either women must contribute to the common fund, or marriage must necessarily more and more be limited to the two extremes of society—those who are rich and equal to the tax upon them, and those who are so poor as to have no social ambitions. The complaints that young men make in these letters about the extravagance of women are well met by lady correspondents, who have no difficulty in showing that the habits of bachelors are far more extravagant than those of maids. But the tastes of the two sexes are so different that it will always be difficult for one to see the other in this matter fairly. A young woman likes a fine house, handsome furniture, and elegant dresses; to obtain these she will pinch in every other form, and keep her household half-starved. A man would live in a plainer style, in humbler quarters, with fewer indulgences in what is merely ornamental, but asks for good dinners and all substantial comforts. Women, as a class, are self-indulgent only in dress, which implies opportunities to display their toilets; men are self-indulgent mainly in things of personal ease, or in their appetites. There is no appreciation on either side of the extravagance of the other, and hence these ceaseless criminations and recriminations, which the correspondence we have referred to largely ventilates, but which are by no means new. If marriage, which binds two people so intimately together, is to retain with us the honorable place it has hitherto enjoyed, and not decline into the Parisian mockery, ways should be found by which the tastes of the two sexes should unite or harmonize. If

a man nowadays does not marry young, he is likely not to marry at all, because, the older he grows, the more widely diverge his ideas from those of womanhood, the greater violence must marriage do to his habits, and the less tractable he becomes to the harness. It is just possible, however, that the antagonisms which so largely prevent marriage may be a wise order of Nature. If matrimony were a smooth primrose-path of ease and pleasure, and no repulsions existed to keep men and women apart, everybody would marry, and the result of this would be an alarming increase of the population. Darwin, in his last work, enters into a calculation to show that a people of twenty-five millions, which should multiply at a rate of increase that would double the population every twenty-five years, would in a little over six hundred years become so numerous, that the entire earth's surface would only afford a square yard of ground for every four persons. It will not do, obviously, for everybody to hasten to the altar. Those who for any reason remain celibates may congratulate themselves that their chance for happiness has been at least even; for the Greek philosopher tells us that, whether a man marries or not, he is sure to regret it; and Talleyrand, taking the other view of the matter, congratulated a bachelor as a lucky fellow, and a Benedict as a happy dog.

— *À propos* to the discussion of the question of the propriety of the German army's entry into Paris after the surrender of the city, it may be worth while to cite the account which M. Thiers, in his "History of the Consulate and Empire," gives of a similar transaction—the entry of the French into Berlin in 1806, after the defeat of the Prussian army at Jena. It was the first time that Napoleon had entered in triumph a conquered capital. He had not thus entered Vienna, having scarcely visited it, but residing at the palace of Schönbrunn, far from the view of the Viennese. But now, as Thiers says, either from pride at having defeated an army reputed invincible, or from a wish to strike Europe with a signal spectacle, or perhaps from the mere intoxication of victory and a desire to humiliate the hated Prussians, he determined to make, on the morning of October 28th, a triumphal entry into Berlin. Thiers says: "The whole population of the city was astir to behold this great scene. Napoleon entered surrounded by his guard, and followed by the brilliant cuirassiers of Generals d'Hautpoul and Nansouty. The Imperial Guard, richly clothed, was this day more imposing than ever. In front marched the foot grenadiers and chasseurs, in the midst Marshals Berthier, Duroc, Davoust, Augereau, and in the centre of this group, isolated through respect, Napoleon, in the simple costume he wore at the Tuileries and on fields of battle—Napoleon, the object of riveted attention to the vast and silent crowd, touched at once with sadness and admiration—such was the spectacle offered in the long and ample street of Berlin, leading from the Charlottenburg Gate to the palace of the Kings of Prussia. The populace thronged the streets, the wealthy burghers the windows. As to the nobility, they had fled, smitten with fear and covered with confusion. The females of the burgher class de-

voured with avidity the spectacle before their eyes; some could not restrain their tears; none uttered vindictive or flattering cries toward the conqueror. Happy Prussia, not to be divided in sentiment, and to preserve her dignity in her disaster! The entrance of an enemy was not with her the ruin of a party or the triumph of another; and there was not within her fold an unworthy faction animated with an odious joy, applauding the presence of foreign soldiers. We Frenchmen, more unfortunate in our reverses, have witnessed this execrable joy, for we have witnessed every thing in this age, the extremes of victory and defeat, of greatness and humiliation, of the purest devotion and the blackest treason!" In these last remarks M. Thiers, of course, alludes to the scenes witnessed in Paris at the restoration of the Bourbons by the allied armies in 1814-'15. He could hardly have thought when penning them that he should live to witness greater disasters to France, and a still more humiliating overthrow of her power. In 1814 France succumbed only to a world in arms against her, after a series of contests in which for nearly twenty years she had been victorious. In 1870-'71 she has fallen before a single adversary, and without the consolation of a single victory to mitigate the shame of her defeats. According to the Christian standard of ethics, it would have been noble of the Germans to refrain from entering Paris, nobler still to have abstained from entering France at all. But the nations, unhappily, are not yet up to that high standard, and it was hardly to be expected that the Germans should set the example. In entering and occupying Paris they have only followed the precedent set them by the French themselves in their day of triumph—a precedent which Napoleon III. would doubtless have followed had he succeeded in leading his army victoriously to the gates of Berlin.

— Ruskin, in a lecture at Oxford on "Landscape," a synopsis of which we gave in a recent number of the JOURNAL, assures us that "much more strength and heart are necessary to paint landscape well than to paint the human form." This is contrary to the usual belief, and we doubt if it can be supported by the facts. "Without strong passion and sensitiveness," says Ruskin, "men can never paint well." This is undoubtedly true, and we believe that landscape exacts these high qualities to a greater degree than is generally supposed. There must enter into landscape-painting, to give it value, a delicate and sensitive appreciation of beauty, a tenderness and sentiment that can penetrate the mere external form and reach the subtle harmonies of Nature. But assuredly a larger and more powerful feeling is necessary in the delineation of life. Not merely is figure-painting more exacting in technical skill; it seems to us to demand a profounder passion, a more vigorous grasp, a deeper sympathy. Just so much as human passion is greater than pictorial description, so is the painting of character above the portrayal of Nature. We are, many of us, deaf, no doubt, to the spirit of Nature, insensible to its beauty, dead to its meaning; but in the tumultuous heart of man there are such aspirations, such love, such

sympathies, such longings, such griefs, such delights, such capacities for good and evil, that only a Shakespeare or a Goethe or a Dante can measure and express them. The great heart of man has been plumbed by the poets better than by the painters. Painting, however, is triumphant in depicting beauty. This sentiment demands both color and form to express it, and, for all that the art may fail to reach in other directions, it can claim full measure of compensation in its unapproachable successes in this one thing. And here, how completely figure-painting would seem to be superior to landscape-painting! If the purple atmosphere of twilight, the soft blue distances of the sky, the light and shade in forest masses, the breadth of sunlight on the meadow, the gloom in the shaded ravine—if all these things tax and distract the ambitious and earnest painter, still, how much more subtle and evasive must be the bloom of the beauty's cheek, the light and lustre and passion of her eye, the matchless white of her bosom, the shifting expressions and untranslatable sentiments that come and go upon her face! The profoundest philosopher, we have been told, cannot penetrate the depths of the peasant-girl's heart; and, if this is true, how supremely difficult must the artist find the translation of woman's beauty! Successful landscapists are more numerous than successful figure-painters, and the reason of this, we think, is, because Nature exacts of the artist less heart and strength, less sentiment, passion, and power, than does human life, notwithstanding Mr. Ruskin's dictum.

— It is a little singular that the rarest thing to be found in dramatic delineations is genuine gayety. Actors may storm, actors may weep, actors may be grotesque, but only once in a while can an actor be found who knows how to be gay. For this reason a whole set of bright, laughing wits of the old comedy are denied to the modern theatre-goer. It would seem not to be a laughing age. There is plenty of rude fun in the theatre, but light, delicate, vivacious wit—sparkle, and fancy, and contagious merriment—these we only rarely get. It was, therefore, an agreeable surprise when Mr. Booth, a week or two since, came out brightly and brilliantly as Benedick in "Much Ado about Nothing." It was the first time he had acted it in New York, and, knowing the somewhat heavy style of the actor, his attempt was looked upon with some apprehension by his friends. We have seen more elaborated and studied performances of Benedick, have seen the character acted with more hearty mirth, but Mr. Booth has succeeded in giving to the part a delightful freshness, and a singularly pleasing individuality. An actor in every thing else too slow and measured, he is in this all swift and vivacious. He is entirely untheatrical. He acts as from a spontaneous impulse, and not from study, and rattles on in a free, easy, off-hand, gentlemanly manner, as if one saw, indeed, before him a fine, handsome, bright-witted cavalier of the olden time. The lady who acts Beatrice is far more shrewish than gay, and we fear that Benedick would be certain in her hands of the "predestinate scratched face."

— In regard to our recent suggestion that the upper stories of large business-houses should be utilized as residences, we find some people mentioning as an objection the noises that would continually rise from the street below. In Broadway this would be more obvious than elsewhere; but the ear soon becomes so inured to continued and monotonous noises that we apprehend this disturbance would soon cease to attract attention. In a recent work on ballooning the writer speaks of the "deep, rich, continuous sound" that rose to his ears from the streets of London when passing over the city. The street-sounds that would reach these upper-story houses would have something of this character, and in a little while would be like the sound of a water-fall to all living near it—never noticed unless the attention is arrested by its suddenly stopping.

Literary Notes.

IF it may be said that Messrs. Hoe & Co.'s illustrated catalogue of printing-presses is neither of literature nor of art, it cannot be claimed with equal confidence that it is of less interest than many legitimate products in those branches of effort. A catalogue is by no means a mere advertisement, or it is better perhaps to say that an advertisement may have large meaning and profound suggestiveness. The number and the various kinds of presses described and pictorially delineated in Messrs. Hoe & Co.'s catalogue serve fairly to bewilder one. There are little presses of marvellously-novel construction worked by the hand, and gigantic monsters for steam-power, which are piled up story upon story, are as big as a small house, and cost to build a deal more than many a big house does. The "ten-cylinder type-revolving machine" gives ten impressions at each revolution of the type-cylinder, and piles up twenty-five thousand papers in an hour! And then for machines whose ways are peculiar, there is the "patent numbering ticket-press," an outlandish-looking medley of cogs and wheels, the intricate mazes of which the best Philadelphia lawyer would be dazed to look at. We are told that this machine at one operation prints, numbers, and deposits tickets in consecutive order, numbering from one up to ten thousand. If a machine now could be invented to distribute tickets at railway-offices, and do the thing politely, what a satisfaction and comfort it would be to travellers! The Hoe presses are almost legion, and their variety, if not infinite, quite beyond our patience to compute. As one turns over the page he cannot help wondering what Gutenberg and Faust would say to the marvellous creations could they come back to see them. The old gentlemen would doubtless cry out with amazement at witnessing the prodigious progeny that had sprung from their invention, and, trembling with fearful apprehensions, begin to speculate as to what supernatural spirit in man they had unwittingly invoked.

Two new novels have recently appeared in England, which are attracting much attention. The first, "The Hôtel du Petit St.-Jean," was published about a year ago, and among cultivated readers achieved no little reputation. Recently a second novel, by the same author, entitled "Véra," has appeared, and this the English press is praising in the highest terms. There is freshness of style, of method, and of material, and the world of

English novel-readers have found in them a new sensation. The London *Saturday Review*, speaking of "Véra," says that it "heartily recommends to the public a book which cannot fail to please every one who reads it." "Véra" has been reprinted by D. Appleton & Co.; it will be followed immediately by "The Hôtel du Petit St.-Jean."

The third volume of Max Müller's "Chips from a German Workshop" has just appeared from the press of Scribner & Co. This volume leads off with a paper on German Literature, has articles on Shakespeare, on Bacon in Germany, on Schiller, Bunsen, Chamot, German Love-songs, and other erudite matters. The value of Max Müller's contributions to our critical literature is acknowledged by scholars everywhere, and the interest of his papers is equally applauded by readers generally.

M. Jules Michelet, who has taken up his residence in Florence, has just published a new work, entitled "La France devant l'Europe," in which, among many noble pages on France, there are severe attacks on Russia and Prussia, in which the author has allowed his natural prejudices full scope. His description of the dome of Strasbourg concludes with these words: "In the innumerable sculptures, it offers the image of the whole world, angels, animals, men, all Nature, all humanity. The whole forms the entire middle ages, all the accumulated history of the world and of Strasbourg."

Lippincott's "Dictionary of Biography and Mythology," which has been publishing in parts, is now completed, and appears in two handsome imperial octavo volumes. This dictionary is very comprehensive in its range, and assiduous pains appear to have been taken to make it accurate. The space allotted to each name is compact, and yet so numerous are the subjects that the work completed is objectionably cumbersome. The editor deserves credit for the thorough manner in which he has performed his laborious and really gigantic task.

Charles Scribner & Co. have issued the first volume of "The History of Greece," by Professor Curtius, a German scholar of great learning and ability. The translation is made by A. W. Ward, professor of history in an English college, and is apparently very well done. The book is beyond doubt the best history of Greece that has yet appeared, and embraces the latest results of German research and German criticism.

Messrs. Scribner & Co. have published, in their "Illustrated Library of Wonders," a volume of "Wonderful Escapes," revised from the French, with original chapters added—a well illustrated and very readable little volume, which, if of less value than other issues of the series, is possibly of greater interest to the general reader.

Labouchere's "Diary of a Besieged Resident in Paris" is announced for speedy publication in London; and also Professor Sheppard's "Siege of Paris," consisting principally of letters to the *New-York Examiner* and the *Cincinnati Gazette*.

After a long silence, Bailey, author of "Festus," will publish a new poem. The title is "Life Recluse," the length about two hundred and fifty lines.

Louis Blanc, the French historian and politician, has nearly finished a history of England, in seven volumes, which will be published this fall, simultaneously in French and in English.

Scientific Notes.

Agassiz's Museum at Cambridge.

THE collection, begun with Mr. Agassiz's materials, which, to use his own words, "were hardly known abroad, and attracted little attention at home," has already assumed immense proportions, and is known and appreciated by men of science all over the globe. The museum building, as it is now, cannot properly be called a place of exhibition, but it is emphatically and almost exclusively a great storehouse. Even the dozen or more who are at work upon the collections are crowded into the smallest possible space. Barrels, casks, boxes, and jars, unnumbered and almost innumerable, fill nearly the entire space from floor to ceiling, and from cellar to attic. With the exception of four exhibition-rooms, and one room for instruction and lectures, there is barely room to elbow one's way among the closely-packed material, and even in these rooms every available space is pressed into service. One can have but a faint idea of the amount of specimens stowed away in the jars of alcohol and the piled-up boxes, from any description of the scene, or even by looking at the receptacles that hide the treasures from public view. There is alcohol for preserving specimens in the various jars and bottles of all shapes and sizes, sufficient for floating a small craft, if all brought together. But this is not a heterogeneous and unselected mass. Every box and jar is distinctly labelled, and any specimen in the building can be readily found with no further inconvenience than that of removing the materials in its way, and this inconvenience is due, not to a want of system, but to a want of room. Mr. Agassiz has always exercised the utmost care that the *locality* of each specimen should be distinctly marked upon its label, together with its name and the authority of some reliable naturalist, and this is because, as he says, "it must be obvious that the question of the origin of species is not likely to be discussed successfully, before the laws of geographical distribution of organized beings have been satisfactorily ascertained." As soon as the building is large enough, the specimens will be so arranged as to make manifest these laws, so far as may be.

Probably the most curious ant in the world is the parasol-ant of the West Indies. Dr. Forbes Winslow, in his work on Light, says these ants walk in long procession, each one carrying a cut leaf over its head as a parasol, in the sun, and they deposit these in holes ten or twelve feet under ground, apparently with no other object than to form a comfortable nest for a species of white snake, which is invariably found coiled up among them.

Scientific experiment shows the following number of beats a second for the wings of each insect: The common fly, three hundred and thirty; the drone, two hundred and forty; the bee, one hundred and ninety; the wasp, one hundred and ten; the hawk-moth, seventy-two; the dragon-fly, twenty-eight; and the cabbage-butterfly, which is inaudible, nine beats a second.

The strongest vegetable fibre known is said to be that of New-Zealand flax. It has sword-like leaves, ten or twelve feet in length. It is used by the settlers for binding their sheaves, fastening their gates, tying up their horses, and in almost every possible way.

When leaden rifle-bullets are fired against iron targets, the lead is melted and spattered

upon the target in the form of a star. This fact is stated as the result of careful experiments recently made at Basle, in Switzerland.

Among the astronomers who went from England to Sicily to observe the late eclipse, were two women, appointed to take observations with the spectroscope.

The number of known species of lichens is about five thousand.

Foreign Items.

THE Princess Mathilde Demidoff, Napoleon's cousin, offers in the Belgian papers a reward of fifteen hundred francs for the recovery of a small trunk, containing autograph letters from some of the most distinguished French authors, which was stolen from her during her hasty journey from Paris to the capital of Belgium in September last. The trunk contained also the whole correspondence of the princess with the late M. Sainte-Beuve.

Bismarck receives now, for the various offices which he holds in the cabinet and in the army, an aggregate salary of forty-one thousand thalers. His large estate at Varzin yields him an additional twenty thousand thalers, so that the great chancellor of the Germanic empire is now in very comfortable circumstances. Twenty years ago he was so largely in debt that he was one day unable to raise two hundred dollars on his note at a Berlin banking-house.

The German prince most opposed to French influence, French literature, and French fashions, since the breaking out of the war, is King Louis of Bavaria. After forbidding the manager of his theatre at Munich to produce any more French operettas and ballets, he has now given the ladies of his court to understand that they would do him a favor if they would no longer wear chignons, crinolines, etc.

M. Boulette, the custodian of the Jardin des Plantes in Paris, shed bitter tears when he was informed that the wild beasts, which had been so long under his care, were to be slaughtered. He hastened to the Governor of Paris and implored him almost on his knees to revoke the order, and he was perfectly beside himself when told that the order must be executed.

In spite of the assurances of friendship which the courts of Vienna and Berlin have recently exchanged, the Emperor Francis Joseph is reported to be deeply mortified at the extraordinary successes achieved by the Prussian armies; and they say in Vienna that he speaks of the Emperor William in any thing but respectful terms when conversing with his courtiers.

King Victor Emmanuel has one of the finest entomological collections in Italy, most of the specimens of which he has personally collected. Madame Rattazzi, alluding to the king's predilection for the study of entomology, maliciously said of him, some time ago, "Give Victor Emmanuel a rare bug, and he will be more grateful to you than if you give him a new province."

The vigor with which Adolphe Thiers, despite his seventy-four years, bears the excitement and hardships of his present arduous and responsible position, is truly remarkable. The other day he told an Austrian diplomatist, who congratulated him on his activity and good health, that, since the 4th of September last,

he had never slept more than four out of twenty-four hours.

Ponson du Terrail, the most productive of the living French novelists, and the favorite romancier of the Emperor Napoleon, was taken prisoner at the battle of Le Mans, where he commanded a battalion of *Moblots*, and sent to a small town in East Prussia, from which he wrote a series of amusing and spicy letters to the *Etoile Belge*.

Bishop Dupanloup, of Orleans, has announced his intention to lecture this spring in France and Belgium for the relief of the suffering French peasants. The widow of the celebrated Count Montalembert has offered to give for the same purpose the whole copyright on her late husband's works for the next five years.

The Queen of Denmark, who is noted for her economical and simple habits, excited the other day no little attention by driving in a plain calico dress in an open barouche through the streets of Copenhagen. The queen is by far more popular in Denmark than her royal husband, who is disliked on account of his German descent.

King Charles of Sweden is not, as has been generally reported, a contributor on subjects of national economy to the Stockholm daily press. The articles, supposed to be his, are written by his brother. The king writes fair poetry, of which he has published several volumes, and novels, of which the Scandinavian critics do not speak very highly.

There are now in the prisons of Prussia forty-five persons convicted of murder, and sentenced to suffer death by decapitation. The Emperor William will decide, upon his return to Berlin, whether the sentences shall be executed or commuted to imprisonment for life. The general opinion in Prussia is, that the latter will be the case.

For many years past, the churches in all parts of Germany have not been frequented by as many worshippers as since the breaking out of the war with France. The Dom in Berlin, especially, is hardly large enough for the crowd which attend divine service there on Sundays.

Prince Richard de Metternich, who still represents the Austrian Government in France, has vainly applied to Count von Beust to be transferred to some other court. The Austrian chancellor replied that the Emperor Francis Joseph desired that he should remain in France.

Paul de Cassagnac has gone to St. Petersburg for the purpose of settling there permanently, and, if he can get the necessary permission from the Russian Government, starting a daily newspaper in the French language at the capital on the Neva.

Among the decrees issued by Gambetta, while he was at the head of the French War Department, was one prohibiting officers in the army, while in the field, from sending challenges to one another, under pain of immediate dismissal from the service.

The Grand Council of the Legion of Honor, during the siege of Paris, deprived a large number of prominent officers of the second empire of their *grands cordons*. It is said that Prince Napoleon is one of them.

Leverrier, the celebrated astronomer, who was deposed from the directorship of the Im-

perial Observatory in Paris at the time when Emile Ollivier became Prime-Minister of France, lives at present in great poverty at Milan.

A noble lady of Saxony has, perhaps, been more heavily stricken by the war with France than any other mother in Germany. Her four sons and five sons-in-law went to the war, and all of them were killed in battle.

Guizot has been confined to his bed for several months past, but his mind is as active as ever; and he dictates ten or twelve hours every day to his daughter-in-law, who acts as his amanuensis.

The London *Situation* and the Brussels *Drapeau*, the two papers founded by the leaders of the French imperialists since the downfall of the second empire, announce that they will suspend publication on the 15th of March.

The unfinished manuscript of an autobiography of Alexander von Humboldt has been found in Vienna. It is said to abound in interesting matter, and will be published at an early day.

Disraeli's "Lothair" has been translated into nine languages. A Russian translation has recently been published at Moscow, and a Hungarian one at Pesh.

Seventeen poets, nine romancists, five historians, three savants, and six members of the French Academy, occupy seats in the National Assembly of France.

M. Pouyer-Quertier, the new French Minister of Finance, is, next to M. Schneider, the proprietor of the Creuzot iron works, the wealthiest manufacturer in France.

A grand-nephew of Silvio Pellico, whose celebrated "*Le Mia Prigione*" excited so much indignation against the Austrian Government, is now a colonel in the Austrian army.

The remains of Alexandre Dumas, in accordance with a wish he expressed on his death-bed, will be sent for interment to his favorite city, Havre de Grace.

Jean-Jacques Offenbach is at present in Rome. His friends assert that he will never return to Paris.

The circulation of *Kladderadatsch* (the Berlin "*Punch*") is three times as large as that of the London *Punch*.

Five hundred and ninety-eight caricatures about the war with France were published in Germany from July till December, 1870.

Ernest Rénan is said to have become a confirmed hypochondriac.

Berthold Auerbach has rented a house at Strasbourg, where he will finish his new novel.

Venice has at the present time no fewer than nineteen daily papers.

Marshal Prim left to his widow property valued at upward of half a million dollars.

Miscellany.

New-York Bars.

THE New-York bar-room is a matter of wonder to foreigners and New-Englanders. Western and Southern visitors have the institution at home; and New Orleans, San Francisco, and Chicago, rather outdo us in promi-

uous and general drinking. But if a stranger, unused to this sort of life, would like to see it in its most animated and marked aspects, he should visit the lower Delmonico's in Broad Street, at about noon, the Delmonico's at the corner of Chambers Street and Broadway, and Jerry Thomas's on Broadway near Twenty-third Street, or the Fifth-Avenue-Hotel bar-room, at night. These, of course, are only samples of the innumerable saloons that flourish in New York; but they are rather good ones. At the Broad-Street Delmonico's, the noonday scene is one well calculated to astonish the unsophisticated visitor. It is the great resort of the stock and gold brokers—a dashing, free, animated set, who indulge in expensive liquors, and are notorious for drinking early and drinking often. All during the stock hours, these men flow in and out of Delmonico's in steady streams; the bar is always difficult of access, on account of the numbers thronging around it; and the gay laugh, the jest, the popping of champagne-corks, the clatter of glasses, the rush of waiters, the hundreds ceaselessly busy at what Dickens called "perpendicular drinking," make up a scene of amazing bustle. Brandy is the favorite liquor. Champagne comes next. The lavish expenditure at this bar is perhaps unparalleled by any other in the country. Of course, the patrons are not exclusively brokers—merchants and bankers are found there at all times, and the visitor can almost at any time see in the groups gathered within the spacious saloon some of the most noted men in New-York business. The dissipation is very well-bred, and people who rarely go to a bar will consent to be seen at Delmonico's. Similar scenes are enacting elsewhere, day and night; but, next to the Fifth-Avenue bar-room, Jerry Thomas's is probably the most frequented place after dark. This shop is a museum as well as a bar. It contains all, or nearly all, the caricatures of celebrities, painted by Nast for the *bal d'opéra* a few years ago; to these a good many additions have been made, so that Jerry Thomas's comic gallery is as well visited and appreciated as the exhibitions of the National Academy. There are other curiosities in this well-thronged place. In addition to the places mentioned, there are many gorgeous bars in New York, where our national fondness for spirituous liquors is exhibited in its most active form. The Astor House, St. Nicholas, Metropolitan, and Grand Central bars are very big and very crowded. I should mention the Fifth-Avenue-Delmonico Saloon, where there is no bar, and where everybody sits respectfully at a table. Here the young bloods assemble. All these fine establishments, and the liberal patronage they enjoy, indicate that a question of prohibition in this city would be likely to encounter overwhelming opposition. But, while drinking is very open in New York, it is not more prevalent than in other places, if general testimony may be accepted.

Scotch and French Cookery.

In almost every Scotch farm-house and kitchen is to be seen the big earthen pot, in which bits of mutton, pork, beef, every vegetable almost that can be named, together with a liberal allowance of barley, are thrown. This furnishes the nourishing and savory broth for which the Scotch are famous. With the less carnivorous French it is a more simple affair. A Parisian dame described it to me as follows: Any quantity of beef, from one to five pounds, must be put into an earthen jar or pan having a close-fitting lid, with a little salt, and water in the proportion of a quart for each pound. Boil it so as to skim the grease off, and then

add carrots, a parsnip, leeks in abundance, turnips, celery, four ground cloves, and let it simmer on the top of the oven for from seven to ten hours—only simmer, for a *bouillon* boiled is a *bouillon* spoiled. The meat and vegetables may be served on one dish, and the soup in another, with bread. The beef, when cold, next day can be eaten with shalot or tarragon vinegar. I was once sojourning at a very humble little *auberge* in the south of France, and saw a French gentleman empty his game-bag, the contents of which hardly attained in value to the achievements of our school-days. There was certainly one quail, two or three jays, and what looked like a tame pigeon that had been starved; the rest were tomits, wrens, and, I fear, one or two robin-redbreasts. Nevertheless, our hostess joyfully announced her intention of making a *salmis* therewith, and I watched the operation with real interest. The birds were first cleaned as carefully as fowls; they were then rolled in thin pieces of fat bacon, and roasted for about twelve minutes. Afterward the wings and breasts were cut off and put aside. The rest was cleared off the bones, and minced very fine with some shalots, garlic, cloves, salt. To this was added about half a bottle of white *vin du pays*—*vieux Barsac*, I think—and a few truffles and small mushrooms. This was all simmered together for a quarter of an hour, the wings and the breasts in reserve were thrown in, and it was served up on dry toast. I was invited to partake of it, and can conscientiously affirm that I have never before or since tasted any thing more delicious.

Bunsen.

Bunsen was by nature a scholar, though not exactly what in England is meant by a German scholar. Scholarship with him was always a means, never in itself an object, and the study of the languages, the laws, the philosophies and religions of antiquity, was, in his eyes, but a necessary preparation before approaching the problem of all problems. Is there a Providence in the world or is there not? "To trace the firm path of God through the stream of ages," this was the dream of his youth, and the toil of his old age; and, during all his life, whether he was studying the laws of Rome or the hieroglyphic inscriptions of Egypt, the hymns of the Veda or the psalms of the Old Testament, he was always collecting materials for that great temple which in his mind towered high above all other temples, the temple of God in history. He was an architect, but he wanted builders; his plans were settled, but there was no time to carry them out. He therefore naturally looked out for younger men who were to take some share of his work. He encouraged them, he helped them, he left them no rest till the work which he wanted was done, and he thus exercised the most salutary influence on a number of young scholars, both in Rome, in London, and in Heidelberg. Max Müller says of him: "It has been my good fortune in life to have known many men whom the world calls great, philosophers, statesmen, scholars, artists, poets; but, take it all in all, take the full humanity of the man, I have never seen, and I shall never see, his like again."

Bouillabaisse.

There is a fish-soup which Thackeray has celebrated, known as *bouillabaisse*, passionately beloved by the people of Marseilles and the Southern French, concerning which a great authority says: "Try"—not eat, mind, but try—"the *bouillabaisse*." It is composed of onions, tomatoes, oil, saffron, bread, flavored with herbs and garlic, and, to be perfect, should contain specimens of thirty different kinds of

fish. What I tasted on the Quay at Marseilles, at the sign of *A la Bonne Bouillabaisse*, comprehended, I was told, sardines, tunny, crayfish, oysters, turtle, red mullet, another delicate little pink fish, the name of which I forget, with a flavor of salmon; and I also observed one species unknown, but which seemed to consist of eyes, teeth, and gelatine. Many of these are rare and expensive here; but the beauty of the *bouillabaisse* is, that it can be made of any kind of fish, such as are at certain seasons both cheap and plentiful in the towns and villages on our coast. Dabs, haddocks, codfish-cuttings, whittings, plaice, skate, muscels, mackerel, fresh herrings, and eels, or any fresh-water fish, will answer the purpose. For myself, I would willingly have dispensed with the saffron and part of the oil; but this is a matter of taste. To the Marseilles fishermen, the dish, without saffron, oil, and garlic, would be *un plat manqué*, and our own working-classes are not insensible to the attractions of the onion in almost any form. M. Francatelli, in his "Cookery for the Working-classes," gives his receipt for *bouillabaisse* as follows: "Shred into a saucepan four onions, six tomatoes, thyme, and savory oil, and a wine-glass full of vinegar, pepper, salt, and a pint of water for each person. Boil this for fifteen minutes, throw in what fish you have, cut in pieces, and, when the fish is thoroughly cooked, serve with bread."

Potatoes and Butter.

We heard an anecdote the other day of one of the founders of Christ's Hospital, London, which, we believe, very fairly illustrates the sort of impulses which govern people in willing their property to public institutions. His name was Hunt, and under his will Christ's Hospital now, we believe, receives an income of about one hundred and twenty thousand pounds a year. He was a city merchant, a bachelor, and lived with his brother. This brother had sons and daughters, who were brought up with the expectation of enjoying their uncle's property at his death. But there's "many a slip 'twixt the cup and the lip," and a couple of sharp words at dinner one day between the brothers dissipated all their expectations to the winds. The bachelor had a *penchant* for new potatoes and melted butter, and one day, when the potatoes and the butter-boat happened to come into suggestive contiguity, the epicurean millionaire stuck his fork into a potato, dipped it into the butter-boat, and swallowed it.

"Excellent!"

"Beastly!" answered the brother.

"Beastly! Do you mean to say that I'm a beast?"

"Yes, I do. The man who can dip a potato into the butter-boat in that way must be a beast."

The words were quickly spoken. It was not so easy to recall them. You may ridicule a man's opinion, expose the silliness of his crotchets, laugh at his prejudices, and quiz his personal appearance, and he will forgive you. But there is one limit to this personal criticism. A man's tastes at table are above criticism, and an alderman's sacred. Mr. Hunt thought so. He tore up his will at once, cut off his heir with the mythological shilling, and left all his spare cash and estates to Christ's Hospital.

The Largest Gun in the World.

The latest-born offspring of the art of destruction is a thirty-five-ton gun, just completed at the Royal Arsenal, in England. This monstrous creation was made upon the coil principle, with two strips of wrought-iron,

which, before they were wrapped round the core, were about one hundred and fifty feet in length. On its way to the practice-ground it crushed its own carriage and the tramway upon which it was travelling, but it was coaxed into moving again, and the sponsors of the interesting infant fired it with half a proof charge, its own shot weighing seven hundred pounds, and measuring a foot in diameter, and two and a half feet in length. With this load the monster recoiled nearly nine feet up an inclined trail of seven degrees, but was otherwise unaffected. When it has cut its teeth with larger charges, it is to burn, as a regular dose, one hundred and twenty pounds of pebble-powder, the shot being the seven-hundred-pounder mentioned, with brass studs to fit the rifling of the bore. In firing it a wire was attached to the vent, the bell was rung, and all present hastened under cover. In one of the proof-houses a gunner in a canvas suit stood before a magnetic battery, and at the word "Fire!" touched a stud, when there was a loud report, and the gun was seen smoking prodigiously. It will be tested with a charge of one hundred and fifty pounds of powder, the regular service-charge being one hundred and twenty pounds.

It is the largest piece of ordnance in the world, not excepting those ancient Titans—the Beçapore gun, called the "King of the Plain," the huge stone-ball cannon of the Dardanelles, and "Mons Meg." If an invading enemy will only be kind enough to this triumph of bel-ligerent art, we think there might be a chance of slaughter on both sides. But what a telescope might have been made for the money, and what different sort of "victories" might have been obtained with that sort of weapon! The reflection is, we know, ridiculous: "Guns, drums, and wounds" absorb the world.

False Hair

The danger of wearing false hair is illustrated in a new and forcible way by the recent experience of a Massachusetts dame. Fancying that her natural charms required artificial enhancement, she innocently purchased one of those mysterious and tail-like appendages for the female head, known, we believe, by the technical name of "switches." It was a "switch" equally beautiful and becoming, and for a brief space all was hair and happiness. But presently madam began to feel an unpleasant sensation about the throat every time she assumed the foreign locks—in point of fact, a choke. She would, in her own striking and piscatorial language, "get as red as a boiled lobster, and gasp like a porpus," dreadful symptoms, which disappeared as soon as the "switch" was removed. What was this mystery, no mortal could explain; so madam, being a true Boston woman, called a "medium," and the "medium" called a spirit from the vasty deep. Then did this spirit unfold a long and excursive tale, which, condensed, was to the effect that "she was the woman from whose head the hair had been cut, just after she was—hung!" and that a choke would always attend the wearing of that particular switch. Furthermore, this instructive spirit observed that all false hair retained more or less of the personality of its original owner, and that this was the cause of much insanity and many criminal idiosyncrasies in women—which is an explanation rather more startling than lucid.

Ideas introduced by Christianity.

"Humanity" is a word which you look for in vain in Plato and Aristotle; the idea of mankind as one family, as the children of one God, is an idea of Christian growth; and the science of mankind, and of the languages of

mankind, is a science which, without Christianity, would never have sprung into life. When people had been taught to look upon all men as brethren, then, and then only, did the variety of human species present itself as a problem that called for solution in the eyes of thoughtful observers, and I therefore date the real beginning of the science of language from the first day of Pentecost. After that day of cloven tongues a new light is spreading over the world, and objects rise into view which had been hidden from the eyes of the nations of antiquity. Old words assume a new meaning, old problems a new interest, old sciences a new purpose. The common origin of mankind, the differences of race and languages, the susceptibility of all nations of the highest mental culture—these become, in the new world in which we live, problems of scientific, because of more than scientific, interest. It is no valid objection that so many centuries should have elapsed before the spirit of Christianity infused into every branch of scientific inquiry produced visible results. We see in the oaken fleet which rides the ocean the small acorn which was buried in the ground hundreds of years ago, and we recognize in the philosophy of Albertus Magnus, though nearly twelve hundred years after the death of Christ, in the aspiration of Kepler, and in the researches of the greatest philosophers of our own age, the sound of that key-note of thought which had been struck for the first time by the apostle of the Gentiles: "For the invisible things of Him from the creation of the world are clearly seen, being understood by the things that are made, even His eternal power and Godhead."

Thomas Carlyle's Portrait of Bismarck.

Considerable misconception as to Herr von Bismarck is still prevalent in England. The English newspapers—nearly all of them—seem to me to be only getting toward a true knowledge of Bismarck, but not yet got to it. The standing likeness, circulating everywhere ten years ago, of demented Bismarck and his ditto king to Strafford and Charles I. *versus* our Long Parliament (as like as Macedon to Monmouth, and not liker), has now vanished from the earth, no whisper of it ever to be heard more. That pathetic Niobe of Denmark, reft violently of her children (which were stolen children, and were dreadfully ill-nursed by Niobe Denmark), is also nearly gone, and will go altogether so soon as knowledge of the matter is had. Bismarck, as I read him, is not a person of Napoleonic ideas, but of ideas quite superior to Napoleonic; shows no invincible lust of territory, nor is tormented with vulgar ambition, etc., but has aims very far beyond that sphere; and, in fact, seems to me to be striving with strong faculty, by patient, grand, and successful steps, toward an object beneficial to Germans and to all other men. That noble, patient, deep, pious, and solid Germany should be at length welded into a nation, and become Queen of the Continent, instead of vaporing, vainglorious, gesticulating, quarrelsome, restless, and over-sensitive France, seems to me the hopefulest public fact that has occurred in my time.

The American Bird-trade.

The bird-trade in America seems to be in a flourishing condition. Over forty thousand canaries are brought in every year, and probably ten thousand more are raised in this country for the purpose of sale. The number of bullfinches, goldfinches, thrushes, robins, and larks, annually imported, rise as high as five or six hundred for each variety. There are fully three thousand Java sparrows brought to the

United States by vessels from that region, and fully as many parrots are yearly sold in this city alone. Waxbills and other minute varieties are scarce, and seldom arrive in quantities of more than one or two hundred each year. Parrots and love-birds from Australia follow parrots in their relative importance. In native birds there is no reliable data to go upon. It is roughly estimated that about ten thousand mocking-birds find their way from the wild nest to the cage each succeeding year.

English Servants.

The ladies who are attacking and defending the housewifely character of Englishwomen seem to us to miss, purposely, one grand element in the question, and that is the extreme dislike felt by English servants for notable housewives. They can hardly be induced to endure them. The Frenchwoman of the middle class, whose economical skill is held up to such admiration, exerts it in no slight degree at the expense of her domestics, who are well treated in some ways—talked to, for example, as if they were human beings like their employers—but are governed, not to say driven, in a style which English servants in the more civilized districts have decided not to endure. French servants do not mind it, or at least do not rebel against it, think scolding part of the bargain, expect, or rather enjoy, an incessant interference, which is compensated by their consequent position as humble friends, look upon meanness as rather a virtue than a vice, and are, if not eager to learn, at least penetrated with the idea that they ought to be. English servants are of a different type. Their pride is their knowledge of their work, their foible impatience of interference, and their most confirmed habit a reticence or artificiality in the presence of superiors which of itself almost prohibits the humble-friend relation so frequently met with in France, and in Italy almost universal. An Italian man-servant, in particular, is the best servant in the world, provided he is treated as a sort of child of the house, and one of the worst if he is not. English housewives in almost every grade of the middle class purchase household peace at the cost of abstaining from any personal share in the executive details of the household economy. The better the cook, the less will she tolerate her mistress's being constantly in the kitchen; the more active the housemaid, the less will she bear to be "follered about and drove." Many excellent servants dislike even to be much talked to, the restraint which English manners compel them to put upon their speech, voices, and manner, speedily becoming irksome. It is one of the strangest facts in our civilization, and one which throws a great light on many educational failures, that the British servant never adopts the conventional manner permanently; never sees that the low voice, and the civil "way," and the restrained temper, are distinctly in themselves better things than the clanging tongue, and rough manner, and habit of unrestraint, universal among our semicivilized population. The low voice of the dining-room is laid aside in the kitchen, the civil way becomes brutal frankness at home, and, once out-of-doors, the restrained temper gives way to a chronic fury. We back a servant, educated, trained, disciplined to mildness as no gentleman or lady is disciplined, to be more outrageously violent than any other human being.

Suicides.

In analyzing the statistics of inquests held as coroner of Central Middlesex, Dr. Lankester points out, in his seventh annual report, that

the proportion of suicides to the population in England and Wales is one in twelve thousand of the population, while the proportion in Central Middlesex is about one in thirteen thousand of the population. The figures seem to show that, of all causes of death, suicide is the most constant. The proportion in which the sexes commit suicide is nearly everywhere the same. It may be stated that the proportion of males to females is as five to two. The ages at which suicide is committed are for the seven years nearly the same. One in twelve are young people under twenty years of age; a larger proportion among people above sixty; and the remainder, four-fifths of the whole, are equally divided among people from twenty to forty years of age. A further analysis of the cases shows that, as a rule, women prefer taking poison and drowning themselves. Of the twenty-three cases of female suicide in 1868-'69, six were from poison and ten from drowning. Women seldom cut their throats or hang themselves, while, of the sixty-six cases of male suicide, exactly half chose these methods of self-destruction. Men are also more given to jumping out of windows and from the tops of high places.

The Mayflower Furniture.

A Boston auctioneer, one auction-day, Intent on trade, but keeping up a play Of random squibs and antiquated jokes, Just for the amusement of the common folks, Sold off his cooking-stoves and other wares, Until he reached two ancient high-backed chairs.

"Here's a rare chance," said he, "and whoso buys, Will gain possession of a wondrous prize; For these are Mayflower chairs, of that choice stock

Landed long since on famous Plymouth Rock; For as the Ark of Noah, that ancient rover, In which 'three brothers,' with their wives, came over,

Had every thing most nicely ranged in pairs, So, in the Mayflower, came this brace of chairs."

"Hold!" said a customer, "that explains to me

What long has been an untold mystery; They came in pairs—I have it at the last— And that is why they multiply so fast!"

Varieties.

PROFESSOR AGASSIZ says that it is tolerably well ascertained that within the last two hundred thousand or three hundred thousand years a strip of the coast, varying from five to ten or twelve miles in width, has been worn away from Cape Hatteras to the British provinces. If the process is to go on for the next two hundred thousand or three hundred thousand years, the situation will become unpleasant for those who live five or ten miles from the present coast line.

The Methodists in this country have eight thousand eight hundred and twenty ministers; the Baptists, eight thousand seven hundred and forty-seven (including all the branches); the Presbyterians, four thousand two hundred and thirty-eight; the Congregationalists, three thousand one hundred and sixty-eight; the Episcopalians, two thousand seven hundred and ten.

It is said that during the first year of his presidency, Mr. Lincoln, being annoyed one day by a poor fiddler's straining harsh discord under his window, sent him out a dollar, with a request that he would play elsewhere, as one scraper at the door was sufficient.

One may insert a thousand excellent things in a newspaper and never hear a word of them

from its readers. But let a line or two not suited to their tastes creep in by accident or otherwise, and one hears of it from every quarter.

The Episcopal Church has at present thirty-nine diocesan and nine missionary bishops, with two hundred and twenty-two thousand communicants. The contributions last year amounted to five million two thousand seven hundred and twenty-two dollars.

In the Antarctic seas there are sea-weeds which have stems about twenty feet high, and with a diameter so great that they have been collected by mariners in those regions for fuel, under the belief that they were drift-wood. They are as thick as a man's thigh.

Mrs. Partington is credited with having ordered some "Cherry Pictorial" for her cough; but it was not she, nor yet a descendant of Paul, who a few days since inquired at a newspaper stall for a copy of the "Ulcerated News."

Ninety-seven out of every hundred Swedish children, between five and fifteen years of age, attend school. This percentage is reached by no other country in the world, not excepting Prussia, where education, if not so general, is of a higher order.

A Vermonter has grown a beard more than two yards long, and there is immense competition among the proprietors of the various hair-invigorators as to who shall secure him for exhibition.

During 1869 no less than eleven thousand four hundred and sixteen persons in the Bengal Presidency died from snake-bites. Let them pray for a Saint Patrick to repeat the miracle he blessed Ireland withal.

It is claimed for Maine, by its citizens, that in her laws in regard to the property of married women, and the admission of evidence in criminal trials, she has the most civilized code in the world.

A boy eight years old, in one of our public schools, having been told that a reptile "is an animal that creeps," on being asked to name one on examination-day, promptly replied, "A baby."

An inscription, supposed to be Runic, has been found at the opening of a tumulus on an estate in County Louth, Ireland.

Mloza Kaglon-Bey, the well-known Tartar professor and Orientalist, died at St. Petersburg on the 9th of December.

A poultry-fancier lately procured a picture of a favorite hen, which was so natural that it laid on his table every day for several weeks.

Mrs. Johnson is lecturing in Indiana on "Man in the Raw." Her next topic will be "Woman, Roast on the Half-Shell."

What is that which is full of holes and yet holds water? A sponge.

General de Paladines is sixty-seven.

The Siamese twins have fifteen children.

A foreign climb—ascending the Alps.

Rich music—a million air.

The Museum.

THE Traveller's Tree of Madagascar is abundant on the sides of the hills, in the valleys, and in every moist part of the country. The tree, *Urania speciosa*, bears as its native name *rarinala*, which literally means "leaf of the forest." It rises from the ground with a thick, succulent stem, like that of the plantain, to which it bears a strong resemblance. It sends out from the centre of the stem long, broad leaves, rising, not round the stalk, but in two lines on opposite sides; so that, as the leaves increase, and the lower ones droop at the end, or extend horizontally, the tree presents the appearance of a large, open fan. When the stem rises ten or

twelve feet high, the lower part of the outer covering becomes hard and dry, like the bark of the cocoanut-tree. "Many of the trees," says a traveller, "reach thirty feet from the ground to the lowest leaves. I frequently counted from twenty to twenty-four leaves on a single tree, the stalk of each leaf being six or eight feet long, and the broad leaf itself four or six feet more. The whole of these twenty-four bright-green, gigantic leaves, spread out like a fan at the top of a trunk thirty feet high, presented a spectacle as impressive as it was rare and beautiful."

This tree has been greatly celebrated for containing, even during the most arid season, a large quantity of pure, fresh water, supplying to the traveller the place of wells in the desert. So abundant and pure is the water that natives will often not take the trouble to go to a stream for water, but draw off and drink the fluid of this tree. The writer from whom we have already quoted—the Rev. William Ellis, who published an account of a visit to Madagascar in 1857—was so far skeptical of the stories told of this tree that he resolved to test their truth. Passing, during one of his journeys, a cump of

The Traveller's Tree (*Urania Speciosa*) of Madagascar

these trees, one of his bearers struck a spear four or five inches deep into the thick, firm end of the stalk of the leaf, near to where it joined the trunk of the tree, and, on drawing the spear back, a stream of pure water gushed out, about a quart of which was caught in a pitcher, and all drank it on the spot. The water was found to be cool, clear, and perfectly sweet. "But," says Mr. Ellis, "in Madagascar this tree might with propriety be called the *builder's tree*, rather than the traveller's tree. Its leaves form the thatch of all the houses on the eastern side of the island. The stems of its leaves form the partitions and often sides of houses; and the hard outside bark is stripped from the inner and soft part, and, having been beaten out flat, is laid for flooring; and I have seen the entire floor of a long, well-built house covered with its bark, each piece being at least eighteen inches wide, and twenty or thirty feet long. The leaf, when green, is used as a wrapper for packages, and keeps out the rain. The leaves also serve the purpose of table-cloths and plates at meals; and, folded into certain forms, they are used for spoons and drinking-vessels."

ANNOUNCEMENT.

PICTURESQUE AMERICA.

The publishers of APPLETONS' JOURNAL have the pleasure of announcing the completion of arrangements by which Mr. HARRY FENN will for a time give his professional services exclusively to the prosecution of the series of views entitled "PICTURESQUE AMERICA," which for a few months past has been a conspicuous and attractive feature in the JOURNAL. Mr. Fenn will this spring visit SOUTH CAROLINA, GEORGIA, TENNESSEE, and VIRGINIA, after which he will proceed to sections North and West; and, when the summer heats are over, he will visit other Southern localities. It is the design to illustrate every portion of the Union, in a manner far superior to any thing of the kind hitherto attempted, so that in time the series will present a splendid and complete gallery of American landscapes and places. Mr. Fenn, whose vivid and graphic pencil has placed him at the acknowledged head of American draughtsmen, will for the present give his professional labors solely to the pages of APPLETONS' JOURNAL.

RALPH THE HEIR.

By ANTHONY TROLLOPE.

[“RALPH THE HEIR,” SUPPLEMENT NO. XIX.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF MARCH 18.]

CHAPTER XLVIII.

MR. MOGGS WALKS TOWARD EDGEWARE.

THE judges' decision in Percycross as to the late election was no sooner known than fresh overtures were made to Ontario Moggs by the Young Men's Association. A letter of triumph was addressed to him at the Cheshire Cheese, in which he was informed that Intimidation and Corruption had been trodden under foot in the infamous person of Mr. Griffenbottom, and that Purity and the Rights of Labor were still the watchwords of that wholesome party in the borough which was determined to send Mr. Moggs to Parliament. Did not Mr. Moggs think it best that he should come down at once to the borough and look after his interests? Now Mr. Moggs junior, when he received this letter, had left the borough no more than three or four days since, having been summoned there as a witness during the trial of the petition—and such continued attendance to the political interests of a small and otherwise uninteresting town, without the advantage of a seat in Parliament, was felt by Mr. Moggs senior to be a nuisance. The expense in all these matters fell, of course, upon the shoulders of the father. “I don't believe in them humbugs no longer,” said Mr. Moggs senior. Moggs junior, who had felt the enthusiasm of the young men of Percycross, and who had more to get and less to lose than his father, did believe. Although he had been so lately at Percycross, he went down again, and again made speeches to the young men at the Mechanics' Institute. Nothing could be more triumphant than his speeches, nothing more pleasant than his popularity; but he could not fail to become aware, after a further sojourn of three days at Percycross, of two things. The first was this—that if the borough were spared there would be a compromise between the leading men on the two sides, and Mr. Westmacott would be returned together with a young Griffenbottom. The second conviction forced upon him was that the borough would not be spared. There was no comfort for him at Percycross—other than what arose from a pure political conscience. On the very morning on which he left, he besought his friends, the young men—though they were about to be punished, degraded, and disfranchised, for the sins of their elders, though it might never be allowed to them again to stir themselves for the political welfare of their own borough—still to remem-

ber that Purity and the Rights of Labor were the two great wants of the world, and that no man could make an effort, however humble, in a good cause without doing something toward bringing nearer to him that millennium of political virtue which was so much wanted, and which would certainly come sooner or later. He was cheered to the echo, and almost carried down to the station on the shoulders of a chairman, or president, and a secretary; but he left Percycross with the conviction that that borough would never confer upon him the coveted honor of a seat in Parliament.

All this had happened early in March, previous to that Sunday on which Mr. Neeft behaved so rudely to him at the cottage. “I think as perhaps you'd better stick to business now a bit,” said old Moggs. At that moment Ontario was sitting up at a high desk behind the ledger which he hated, and was sticking to business as well as he knew how to stick to it. “No more Cheshire Cheeses, if you please, young man,” said the father. This was felt by the son to be unfair, cruel, and even corrupt. While the election was going on, as long as there was a hope of success at Percycross, Moggs senior had connived at the Cheshire Cheese, had said little or nothing about business, had even consented on one occasion to hear his son make a speech advocating the propriety of combination among workmen. “It ain't my way of thinking,” Moggs senior had said; “but then, perhaps, I'm old.” To have had a member of the firm in Parliament would have been glorious even to old Moggs, though he hardly knew in what the glory would have consisted. But as soon as he found that his hopes were vain, that the Cheshire Cheese had been no stepping-stone to such honor, and that his money had been spent for nothing, his mind reverted to its old form. Strikes became to him the work of the devil, and unions were once more the bane of trade.

“I suppose,” said Ontario, looking up from his ledger, “if I work for my bread by day, I may do as I please with my evenings. At any rate, I shall,” he continued to say, after pausing a while. “It's best we should understand each other, father.” Moggs senior growled. At a word his son would have been off from him, rushing about the country, striving to earn a crust as a political lecturer. Moggs knew his son well, and, in truth, loved him dearly. There was, too, a Miss Moggs at home, who would give her father no peace if Ontario were turned adrift. There is nothing

in the world so cruel as the way in which sons use the natural affections of their fathers, obtaining from these very feelings a power of rebelling against authority! “You must go to the devil, if you please, I suppose,” said Moggs senior.

“I don't know why you say that. What do I do devilish?”

“Them unions is devilish.”

“I think they're Godlike,” said Moggs junior.

After that they were silent for a while, during which Moggs senior was cutting his nails with a shoemaker's knife by the fading light of the evening, and Moggs junior was summing up an account against a favored aristocrat, who seemed to have worn a great many boots, but who was noticeable to Ontario, chiefly from the fact that he represented in Parliament the division of the county in which Percycross was situated. “I thought you was going to make it all straight by marrying that girl,” said Moggs senior.

Here was a subject on which the father and the son were in unison—and as to which the romantic heart of Miss Moggs, at home at Shepherd's Bush, always glowed with enthusiasm. That her brother was in love, was to her, of whom in truth it must be owned that she was very plain, the charm of her life. She was fond of poetry, and would read to her brother aloud the story of Juan and Haidee, and the melancholy condition of the lady who was loved by the veiled prophet. She sympathized with the false queen's passion for Launcelot, and, being herself in truth an ugly old maid very far removed from things romantic, delighted in the affairs of the heart when they did not run smooth.

“Oh, Ontario,” she would say, “be true to her; if it's for twenty years.”

“So I will; but I'd like to begin the twenty years by making her Mrs. Moggs,” said Ontario.

Now Mr. Moggs senior knew to a penny what money old Neeft could give his daughter, and placed not the slightest trust in that threat about the smock in which she stood upright. Polly would certainly get the better of her father, as Ontario always got the better of him. Ontario made no immediate reply to his father, but he found himself getting all wrong among the boots and shoes which had been supplied to that aristocratic young member of Parliament. “You don't mean as it's all off?” asked Moggs senior.

“No; it isn't all off.”

"Then why don't you go in at it?"

"Why don't I go in at it?" said Ontario, closing the book in hopeless confusion of mind and figures. "I'd give every pair of boots in this place, I'd give all the business, to get a kind word from her."

"Isn't she kind?"

"Kind; yes, she's kind enough in a way. She's every thing just what she ought to be. That's what she is. Don't you go on about it, father. I'm as much in earnest as you can be. I sha'n't give it up till she calls somebody else her husband; and then—why then I shall just cut it, and go off to uncle in Canada. I've got my mind made up about all that."

And so he left the shop, somewhat uncourteously perhaps. But he had worked his way back into his father's good graces by his determination to stick to Neeft's girl. A young man ought to be allowed to attend trades' unions, or any other meetings, if he will marry a girl with twenty thousand pounds. That evening Ontario Moggs went to the Cheshire Cheese, and was greater than ever.

It has been already told how, on a Sunday subsequent to this, he managed to have himself almost closeted with Polly, and how he was working himself into her good graces, when he was disturbed by Mr. Neeft and turned out of the house. Polly's heart had been yielding during the whole of that interview. There had come upon her once a dream that it would be a fine thing to be the lady of Newton—and the chance had been hers. But when she set herself to work to weigh it all, and to find out what it was that young Newton really wanted—and what he ought to want, she shook off from herself that dream before it had done her any injury. She meant to be married certainly. As to that she had no doubt. But then Ontario Moggs was such a long-legged, awkward, ugly, shambling fellow, and Moggs as a name was certainly not euphonious. The gas-fitter was handsome, and was called Yallege, which, perhaps, was better than Moggs. He had proposed to her more than once; but the gas-fitter's face meant nothing, and the gas-fitter himself hadn't much meaning in him. As to outside appearance, young Newton's was just what he ought to be—but that was a dream which she had shaken off. Onty Moggs had some meaning in him, and was a man. If there was one thing, too, under the sun of which Polly was quite sure, it was this—that Onty Moggs did really love her. She knew that in the heart, and mind, and eyes of Onty Moggs she possessed a divinity which made the ground she stood upon holy ground for him. Now that is a conviction very pleasant to a young woman.

Ontario was very near his victory on that Sunday. When he told her that he would compass the death of Ralph Newton if Ralph Newton was to cause her to break her heart, she believed that he would do it, and she felt obliged to him—although she laughed at him. When he declared to her that he didn't know what to do because of his love, she was near to

telling him what he might do. When he told her that he would sooner have a kiss from her than be Prime Minister, she believed him, and almost longed to make him happy. Then she had tripped, giving him encouragement which she did not intend—and had retreated, telling him that he was silly. But as she said so she made up her mind that he should be perplexed not much longer. After all, in spite of his ugliness, and awkwardness, and long legs, this was to be her man. She recognized the fact, and was happy. It is so much for a girl to be sure that she is really loved! And there was no word which fell from Ontario's mouth which Polly did not believe. Ralph Newton's speeches were very pretty, but they conveyed no more than his intention to be civil. Ontario's speeches really brought home to her all that the words could mean. When he told her father that he was quite contented to take her just as she was, without a shilling, she knew that he would do so with the utmost joy. Then it was that she resolved that he should have her, and that for the future all doubtings, all flirtations, all coyness, should be over. She had been won, and she lowered her flag.

"You stick to it, and you'll do it," she said; and this time she meant it.

"I shall," said Ontario; and he walked all the way back to London, with his head among the clouds, disregarding Percycross utterly, forgetful of all the boots and aristocrats' accounts, regardless almost of the Cheshire Cheese, not even meditating a new speech in defence of the Rights of Labor. He believed that on that day he had gained the great victory. If so, life before him was one vista of triumph. That he himself was what the world calls romantic, he had no idea—but he had lived now for months on the conviction that the only chance of personal happiness to himself was to come from the smiles and kindness and love of a certain human being whom he had chosen to beatify. To him Polly Neeft was divine, and round him also there would be a halo of divinity if this goddess would consent to say that she would become his wife.

It was impossible that many days should be allowed to pass before he made an effort to learn from her own lips, positively, the meaning of those last words which she had spoken to him. But there was a difficulty. Neeft had warned him from the house, and he felt unwilling to knock at the door of a man in that man's absence, who, if present, would have refused to him the privilege of admittance. That Mrs. Neeft would see him, and afford him opportunity of pleading his cause with Polly, he did not doubt—but some idea that a man's house, being his castle, should not be invaded in the owner's absence, restrained him. That the man's daughter might be the dearer and the choicer, and the more sacred castle of the two, was true enough; but then Polly was a castle which, as Moggs thought, ought to belong to him rather than to her father. And so he resolved to waylay Polly.

His week-days, from nine in the morning

till seven in the evening, were at this time due to Booby and Moggs, and he was at present paying that debt religiously, under a conviction that his various absences at Percycross had been hard upon his father. For there was, in truth, no Booby. Moggs senior, and Moggs junior, constituted the whole firm—in which, indeed, up to this moment Moggs junior had no recognized share—and if one was absent, the other must be present. But Sunday was his own, and Polly Neeft always went to church. Nevertheless, on the first Sunday he failed. He failed, though he saw her, walking with two other ladies, and though, to the best of his judgment, she also saw him. On the second Sunday he was at Hendon from ten till three, hanging about in the lanes, sitting on gates, whiling away the time with a treatise on political economy which he had brought down in his pocket, thinking of Polly while he strove to confine his thoughts to the great subject of man's productive industry. Is there any law of Nature—law of God, rather—by which a man has a right to enough of food, enough of raiment, enough of shelter, and enough of recreation, if only he will work? But Polly's cheeks, and Polly's lips, the eager fire of Polly's eye as she would speak, and all the elastic beauty of Polly's gait as she would walk, drove the great question from his mind. Was he ever destined to hold Polly in his arms—close, close to his breast? If not, then the laws of Nature and the laws of God, let them be what they might, would not have been sufficient to protect him from the cruellest wrong of all.

It was as she went to afternoon church that he hoped to intercept her. Morning church with many is a bond. Afternoon church is a virtue of supererogation—practised often because there is nothing else to do. It would be out of the question that he should induce her to give up the morning service; but if he could only come upon her in the afternoon, a little out of sight of others, just as she would turn down a lane with which he was acquainted, near to a stile leading across the fields toward Edgeware, it might be possible that he should prevail. As the hour came near, he put the useless volume into his pocket, and stationed himself on the spot which he had selected. Almost at the first moment in which he had ventured to hope for her presence, Polly turned into the lane. It was six months after this occurrence that she confessed to him that she had thought it just possible that he might be there. "Of course you would be there—you old goose; as if Jemima hadn't told me that you'd been about all day. But I never should have come, if I hadn't quite made up my mind." Then Ontario administered to her one of those bear's hugs which were wont to make Polly declare that he was an ogre. It was thus that Polly made her confession after the six months, as they were sitting very close to each other on some remote point of the cliffs down on the Kentish coast. At that time the castle had been altogether transferred out of the keeping of Mr. Neeft

But Polly's conduct on this occasion was not at all of a nature to make it supposed that Jemima's eyes had been so sharp.

"What, Mr. Moggs!" she said. "Dear me, what a place to find you in! Are you coming to church?"

"I want you just to take a turn with me for a few minutes, Polly."

"But I'm going to church."

"You can go to church afterward—that is, if you like. I can't come to the house now, and I have got something that I must say to you."

"Something that you must say to me!" And then Polly followed him over the stile.

They had walked the length of nearly two fields before Ontario had commenced to tell the tale which of necessity must be told; but Polly, though she must have known that her chances of getting back to church were becoming more and more remote, waited without impatience.

"I want to know," he said, at last, "whether you can ever learn to love me."

"What's the use, Mr. Moggs?"

"It will be all the use in the world to me."

"Oh, no it won't. It can't signify so very much to anybody."

"Nothing, I sometimes think, can ever be of any use to me but that."

"As for learning to love a man—I suppose I could love a man without any learning if I liked him."

"But you don't like me, Polly?"

"I never said I didn't like you. Father and mother always used to like you."

"But you, Polly?"

"Oh, I like you well enough. Don't, Mr. Moggs."

"But do you love me?" Then there was a pause, as they stood leaning upon a gateway. "Come, Polly; tell a fellow. Do you love me?"

"I don't know." Then there was another pause; but he was in a seventh heaven, with his arm round her waist. "I suppose I do; a little," whispered Polly.

"But better than anybody else?"

"You don't think I mean to have two lovers—do you?"

"And I am to be your lover?"

"There's father, you know. I'm not going to be anybody's wife because he tells me; but I wouldn't like to vex him, if we could help it."

"But you'll never belong to any one else?"

"Never," said she, solemnly.

"Then I've said what I've got to say, and I'm the happiest man in all the world, and you may go to church now if you like." But his arm was still tight round her waist.

"It's too late," said Polly, in a melancholy tone—"and it's all your doing."

The walk was prolonged not quite to Edge-ware; but so far that Mr. Neeft was called upon to remark that the parson was preaching a very long sermon. Mrs. Neeft, who perhaps had also had communication with Jemima, remarked that it was not to be expected but that Polly should take a ramble with some of

her friends. "Why can't she ramble where I want her to ramble?" said Mr. Neeft.

Many things were settled during that walk. Within five minutes of the time in which she had declared that it was too late for her to go to church, she had brought herself to talk to him with all the delightful confidence of a completed engagement. She made him understand at once that there was no longer any doubt. "A girl must have time to know," she said, when he half-reproached her with the delay. "A girl wasn't like a man," she said, "who could just make up his mind at once—a girl had to wait and see." But she was quite sure of this—that, having once said the word, she would never go back from it. She didn't quite know when she had first begun to love him, but she thought it was when she heard that he had made up his mind to stand for Percycross. It seemed to her to be such a fine thing—his going to Percycross. "Then," said Ontario, gallantly, "Percycross has done ten times more for me than it would have done, had it simply made me a member of Parliament." Once, twice, and oftener, he was made happier than he could have been had Fortune made him a prime-minister. For Polly, now that she had given her heart and promised her hand, would not coy her lips to the man she had chosen.

Many things were settled between them. Polly told her lover all her trouble about Ralph Newton, and it was now that she received that advice from her "very particular friend, Mr. Moggs," which she followed in writing to her late suitor. The letter was to be written and posted that afternoon, and then shown to her father. We know already that in making the copy for her father she omitted one clause—having resolved that she would tell her mother of her engagement, and that her mother should communicate it to her father. As for naming any day for their marriage, "That was out of the question," she said. She did not wish to delay it; but all that she could do was to swear to her father that she would never marry anybody else. "And he'll believe me, too," said Polly. As for eloping, she would not hear of it. "Just that he might have an excuse to give his money to somebody else," she said.

"I don't care for his money," protested Moggs.

"That's all very well; but money's a good thing in its way. I hate a man who'd sell himself; he's a mean fellow—or a girl either. Money should never be first. But as for pitching it away just because you're in a hurry, I don't believe in that at all. I'm not going to be an old woman yet, and you may wait a few months very well." She walked with him direct up to the gate leading up to their own house—so that all the world might see her, if all the world pleased; and then she bade him good-by. "Some day before very long, no doubt," she said, when, as he left her, he asked as to their next meeting.

And so Polly had engaged herself. I do not know that the matter seemed to her to be of so much importance as it does to many girls. It was a piece of business which had

to be done some day, as she had well known for years past; and, now that it was done, she was quite contented with the doing of it. But there was not much of that ecstasy in her bosom which was at the present moment sending Ontario Moggs bounding up to town, talking, as he went, to himself—to the amazement of passers-by, and assuring himself that he had triumphed like an Alexander or a Cæsar. She made some steady resolves to do her duty by him, and told herself again and again that nothing should ever move her now that she had decided. As for beauty in a man—what did it signify? He was honest. As for awkwardness—what did it matter? He was clever. And, in regard to being a gentleman, she rather thought that she liked him better because he wasn't exactly what some people call a gentleman. Whatever sort of a home he would give her to live in, nobody would despise her in it because she was not grand enough for her place. She was by no means sure that a good deal of misery of that kind might not have fallen to her lot had she become the mistress of Newton Priory. "When the beggar-woman became a queen, how the servants must have snubbed her!" said Polly to herself.

That evening she showed her letter to her father. "You haven't sent it, you minx?" said he.

"Yes, father. It's in the iron box."

"What business had you to write to a young man?"

"Come, father. I had a business."

"I believe you want to break my heart," said old Neeft.

That evening her mother asked her what she had been doing that afternoon.

"I just took a walk with Ontario Moggs," said Polly.

"Well?"

"And I've just engaged myself straight off, and you had better tell father. I mean to keep to it, mother, let anybody say any thing. I wouldn't go back from my promise if they were to drag me. So father may as well know at once."

CHAPTER XLIX.

AMONG THE PICTURES.

NORFOLK is a county by no means devoted to hunting, and Ralph Newton—the disinherited Ralph as we may call him—had been advised by some of his friends round Newton to pitch his tent elsewhere—because of his love of that sport.

"You'll get a bit of land just as cheap in the shires," Morris had said to him. "And, if I were you, I wouldn't go among a set of fellows who don't think of any thing in the world except partridges."

Mr. Morris, who was a very good fellow in his way, devoted a considerable portion of his mental and physical energies to the birth, rearing, education, preservation, and subsequent use of the fox—thinking that in so doing he employed himself nobly as a country

gentleman; but he thoroughly despised a county in which partridges were worshipped.

"They do preserve foxes," pleaded Ralph.

"One man does, and the next don't. You ought to know what that means. It's the most heart-breaking kind of thing in the world. I'd sooner be without foxes altogether, and ride to a drag—I would indeed."

This assertion Mr. Morris made in a sadly solemn tone, such as men use when they speak of some adversity which Fate and Fortune may be preparing for them.

"I'd a deal rather die than bear it," says the melancholy friend; or—"I'd much sooner put up with a crust in a corner."

"I'd rather ride to a drag—I would indeed," said Mr. Morris, with a shake of the head, and a low sigh. As for life without riding to hounds at all, Mr. Morris did not for a moment suppose that his friend contemplated such an existence.

But Ralph had made up his mind that, in going out into the world to do something, foxes should not be his first object. He had to seek a home certainly, but more important than his home was the work to which he should give himself; and, as he had once said, he knew nothing useful that he could do except till the land. So he went down into Norfolk among the intermittent fox-preservers, and took Beamingham Hall.

Almost every place in Norfolk is a "ham," and almost every house is a hall. There was a parish of Beamingham, four miles from Swaffham, lying between Tillham, Soham, Reepham, and Grindham. It's down in all the maps. It's as flat as a pancake; it has a church with a magnificent square tower, and a new chancel; there is a resident parson, and there are four or five farmers in it; it is under the plough throughout, and is famous for its turnips; half the parish belongs to a big lord, who lives in the county, and who does preserve foxes, but not with all his heart; two other farms are owned by the yeomen who farm them—men who have been brought up to shoot, and who hate the very name of hunting. Beamingham Hall was to be sold, and by the beginning of May Ralph Newton had bought it. Beamingham Little Wood belonged to the estate, and, as it contained about thirty acres, Ralph determined that he would endeavor to have a fox there.

By the middle of May he had been four months in his new home. The house itself was not bad. It was spacious; and the rooms, though low, were large. And it had been built with considerable idea of architectural beauty. The windows were all set in stone and mullioned—long, low windows, very beautiful in form, which had till some fifteen years back been filled with a multitude of small diamond panes—but now the diamond panes had given way to plate-glass. There were three gables to the hall, all facing

an old-fashioned large garden, in which the fruit-trees came close up to the house, and that which perhaps ought to have been a lawn was almost an orchard. But there were trim gravel-walks, and trim flower-beds, and a trim fish-pond, and a small walled kitchen-garden, with very old peaches, and very old apricots, and very old plums. The plums, however, were at present better than the peaches or the apricots. The fault of the house, as a modern residence, consisted in this—that the farm-yard, with all its appurtenances, was very close to the back door. Ralph told himself when he first saw it that Mary Bonner would never consent to live in a house so placed.

For whom was such a house as Beamingham Hall originally built—a house not grand enough for a squire's mansion, and too large for a farmer's homestead? Such houses throughout England are much more numerous than Englishmen think—either still in good repair, as was Beamingham Hall, or going into decay under the lessened domestic wants of the present holders. It is especially so in the eastern counties, and may be taken as one proof among many that the broad-acred squire, with his throng of tenants, is comparatively a modern invention. The country-gentleman of two hundred years ago farmed the land he held. As years have rolled on, the strong have swallowed the weak—one strong man having eaten up half a dozen weak men. And so the squire has been made. Then the strong squire becomes a baronet and a lord—till he lords it a little too much, and a Manchester warehouseman buys him out. The strength of the country probably lies in the fact that the change is ever being made, but is never made suddenly.

To Ralph the great objection to Beamingham Hall lay in that fear—or rather certainty—that it could not be made a fitting home for Mary Bonner. When he first decided on taking it, and even when he decided on buying it, he assured himself that Mary Bonner's taste might be quite indifferent to him. In the first place, he had himself written to her uncle to withdraw his claim as soon as he found that Newton would never belong to him; and then he had been told by the happy owner of Newton that Mary was still to be asked to share the throne of that principality. When so told he had said nothing of his own ambition, but had felt that there was another reason why he should leave Newton and its neighborhood. For him, as a bachelor, Beamingham Hall would be only too good a house. He, as a farmer, did not mean to be ashamed of his own dunghill.

By the middle of May he had heard nothing either of his namesake or of Mary Bonner. He did correspond with Gregory Newton, and thus received tidings of the parish, of the church, of the horses—and even of the foxes;

but of the heir's matrimonial intentions he heard nothing. Gregory did write of his own visits to the metropolis, past and future, and Ralph knew that the young parson would again singe his wings in the flames that were burning at Popham Villa; but nothing was said of the heir. Through March and April that trouble respecting Polly Neeft was continued, and Gregory in his letter, of course, did not speak of the Neefts. At last May was come, and Ralph from Beamingham made up his mind that he also would go up to London. He had been hard at work during the last four months doing all those wonderfully attractive things with his new property which a man can do when he has money in his pocket—knocking down hedges, planting young trees, or preparing for the planting of them, buying stock, building or preparing to build sheds—and the rest of it. There is hardly a pleasure in life equal to that of laying out money with a conviction that it will come back again. The conviction, alas! is so often ill-founded—but the pleasure is the same. In regard to the house itself he would do nothing, not even form a plan—as yet. It might be possible that some taste other than his own should be consulted.

In the second week in May he went up to London, having heard that Gregory would be there at the same time; and he at once found himself consorting with his namesake almost as much as with the parson. It was now a month since the heir had been dismissed from Popham Villa, and he had not since that date renewed his visit. Nor from that day to the present had he seen Sir Thomas. It cannot be said with exact truth that he was afraid of Sir Thomas or ashamed to see the girls. He had no idea that he had behaved badly to anybody; and, if he had, he was almost disposed to make amends for such sin by marrying Clarissa; but he felt that, should he ultimately make up his mind in Clarissa's favor, a little time should elapse for the gradual cure of his former passion. No doubt he placed reliance on his position as a man of property, feeling that, by his strength in that direction, he would be pulled through all his little difficulties; but it was an unconscious reliance. He believed that he was perfectly free from what he himself would have called the dirt and littleness of purse-pride—or acre-pride—and would on some occasions assert that he really thought nothing of himself because he was Newton of Newton. And he meant to be true. Nevertheless, in the bottom of his heart, there was a confidence that he might do this and that because of his acres, and among the things which might be thus done, but which could not otherwise have been done, was this return to Clarissa after his little lapse in regard to Mary Bonner.

APPLETONS' JOURNAL

LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 106.—VOL. V.]

SATURDAY, APRIL 8, 1871.

[PRICE TEN CENTS.]

AN OLD BEAU OF THE OLDEN TIME.

"AN OLD BEAU OF THE OLDEN TIME."

WITH AN ILLUSTRATION BY H. L. STEPHENS.

POPPED out of the bandbox of long ago,
Bedizened with tinsel and snowy lace,
He ogled and simpered, and to and fro
He sauntered with airy and charming grace.
Oh, what were the years that had glided by?
He looked on the past with a scorn sublime!
A smirk on his cheeks, and a glass in his eye,
Had this very old beau of the olden time.

Accomplished in each of the arts that please,
He picked up a fan with a pretty air,
And whispered a passion upon his knees,
And led off a minuet with the fair.
He broke sighing hearts with a polished style,
And vowed he was only in manhood's prime.
What mattered a wrinkle or so, the while,
To this very old beau of the olden time?

Oh, many a maid had he wooed and won,
And many a white hand deftly kissed!
That *chapeau*, his powdered wig upon,
Was doffed with a most artistic twist.
A list of the conquests he could tell
Would go beyond reason, and likewise rhyme;
For small talk and small clothes he bore the bell,
This very old beau of the olden time.

He laughed at his own recondite jest,
Albeit his teeth were mighty few;
He gloried in ruffles and gaudy vest,
And silenced his duns and cares anew;
Then onward to conquer again he sped,
This butterfly, happy in every clime!
As light as the cue which adorned his head
Was the very old beau of the olden time.

GEORGE COOPER.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER VII.—HOW A PALADIN STORMED A CASTLE.

In all the sweet South there never was a softer or more beautiful morning—robed in gorgeous autumnal dress, and glorying in a lavish affluence of balmy air, and golden sunshine, and draping haze—than that on which the young owner of Annesdale rode forth to try his fortune at Morton House.

Shortly after leaving his own gates, he overtook an open carriage full of ladies, who were chattering gayly, and who burst into a chorus of welcome when Ilderim's handsome head appeared beside them.

"Mr. Annesley! What a surprise!"

"Why, Mr. Annesley, where did you come from?"

"When did you come back, and how are you?"

Only one of the fair bevy—the fairest among them—said nothing; but she smiled and held out her hand; and neither the smile nor the action left any thing to be desired.

Mr. Annesley answered all the inquiries, and exchanged all the civilities of the occasion; and then rode along by the side of the carriage, resting one hand lightly on the door, while with the other he restrained Ilderim's eager impatience; and the stream of conversation flowed on in easy and lively current.

"You have been to Mobile, Mr. Annesley?" asked the gay young chaperon of the party—pretty Mrs. George Raynor, who had been a Miss Vernon and a Mobile belle before she married, and came to dazzle Lagrange with her beauty and her fashion. "Oh, do tell us something

about it, for we are almost dying—Irene and I—for news of all our friends."

"With all my heart," said Morton, smiling; "but where shall I begin? I was only in Mobile for a few days, and I scarcely saw any thing of the people you would care to hear about."

"Ah, I care to hear about anybody," cried she, with fervor. "And, if you did not see anybody, just tell me what they are talking about in the city. I wish I had known you were going, I would have asked you to take a package to Aunt Lucy—and, perhaps—to bring me a bonnet back."

"You are glad she did *not* know, are you not, Mr. Annesley?" said Miss Vernon, laughing.

Morton smiled only, in reply to the last question, preferring, it seemed, to answer Mrs. Raynor's remark. "If I had not left home so hurriedly, you should have known," he said. "But I did manage to see your aunt, and she charged me with a great many messages to yourself and Miss Vernon—the chief of which," he added, turning to the latter, "I feel tempted not to deliver."

"Is it so very disagreeable, then?" asked she.

"It will not be at all disagreeable to you, I am afraid; but she urges your speedy return to Mobile, and that will be very disagreeable to Lagrange."

"Lagrange will have to support the desolation as best it can, and I have no doubt will be able to endure it," said Miss Vernon, a little coolly—thinking, no doubt, that the compliment would have gained point and strength by a more personal application.

Then a cry broke from the other two young ladies, who were both Misses Raynor, plain in looks, plain in manners, and therefore blindly admiring the Vernon beauty, and emulous of the Vernon style.

"Oh, Irene, you surely will not think of leaving us!"

"Irene, that is *very* mean of your aunt, for she knows you promised to stay until after Christmas."

"Nonsense!" said Mrs. Raynor. "Irene knows she is not going until I am ready to go with her; and only George can say when that will be—he is so provoking! Mr. Annesley, I do hope that when you are married, you will treat your wife with some consideration."

"I shall endeavor to do so, Mrs. Raynor," answered Morton, with mock-gravity—for all Lagrange knew that George Raynor was the most thoroughly hen-pecked husband in the county—"I shall come to you for instructions how to act. But you have not told me what has been going on here since I left."

"Nothing has been going on in any way," said Mrs. Raynor.—"Irene, what have we been doing?—any thing at all?"

"Vegetating and yawning, I believe," answered Miss Vernon. "But these principal occupations have been varied by much gossip, and a little scandal, lately."

"Oh, yes!" burst in Mrs. Raynor, with the greatest animation. "Lagrange has been in a perfect ferment of gossip for the last three weeks, Mr. Annesley, about that curious Miss Morton, or Mrs. Gordon, or whatever her name may be, who has come back like a ghost, and set everybody talking themselves hoarse. Of course you have heard of her?" (She did not give him time to reply.) "For my part, I believe that she murdered both her husband and her brother, and that she has come here to bury her remorse, and give Lagrange a standing topic of conversation. I am sure—Good gracious, Louisa, what is the matter? Is there a caterpillar on my bonnet?"

The inquiry was not entirely without reason, for the elder Miss Raynor had been making signals of silence and distress for the last five seconds, without being able to attract her heedless sister-in-law's attention.

"No, indeed, Flora," she said, blushing with that ever-ready and not always becoming blush of eighteen. "But you surely forget—Mr. Annesley is related to—"

"To my murderess?" cried Mrs. Raynor, extricating herself from the difficulty with the merriest laugh in the world. "A thousand pardons, Mr. Annesley! But you know how heedless I am! I am sure I need not apologize for mere jesting."

Mr. Annesley's face had taken an expression which few people had ever seen upon it before. A stern coldness transformed it so entirely that the ladies exchanged glances of surprise and dismay. He bowed quite haughtily, as he said, with gravity:

"Personally, I could not of course be offended by what was not meant to touch myself. But I must confess that my ideas of 'jesting' do not agree with those of Mrs. Raynor."

* REVERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

"I am very, very sorry," cried that lady, eagerly, coloring a little, and slightly disconcerted by his manner and words. "You must really forgive me, Mr. Annesley! I did not remember at the moment your connection with Mrs. Gordon. Indeed, it never occurred to me that you would care. Adela talks just as everybody else does."

"I am sorry to hear it," said Mr. Annesley, in the same tone as before.

"And, really," continued Mrs. Raynor, rallying from her momentary embarrassment, and recovering her usual nonchalant gaiety—"really, Mr. Annesley, you are very unreasonable. I only repeated what everybody is saying. Pray don't hold me accountable for the reports!"

Mr. Annesley's face relaxed into a smile—rather grave, it is true—as he answered: "You are right, Mrs. Raynor. It was unreasonable, nay, it was folly in me to resent what is in itself so trifling a matter as these reports. Gossips must have something to talk about, of course. It is I who must beg your pardon for having forgotten this."

"Why, Mr. Annesley, I don't know you!" exclaimed Mrs. Raynor, astonished, annoyed, and amused, all at once. "I always thought you a model of amiability; but you are not amiable at present, I assure you. I did not know that you had laid lance in rest, in Mrs. Gordon's defence, or I should not have said a word. And, by-the-way, don't flatter yourself that you are her only champion. Irene has been doing battle in her defence from the first."

"Have you?" said Morton, turning quickly to Miss Vernon. "I hope you will let me admire and thank you for it."

"Pray don't," answered she. "I only heard a woman assailed, and felt for her—that was all."

Before the gentleman could reply, Mrs. Raynor's light tones broke in again:

"I positively victimized myself by going to church last Sunday in order to catch a glimpse of this ghostly lady; and would you believe it, Mr. Annesley, she did not come! I wonder if she never means to come? But somebody said that a splendid-looking child, who sat in a pew next the pulpit, was hers."

"Oh, yes," chorussed the Misses Raynor, "and *such* a woman with him! If you *could* have seen her bonnet! And, what do you think, Mr. Annesley?—she actually sat up and said her beads all the time Mr. Norwood was preaching—and that under his very eyes!"

"She is evidently a Frenchwoman," said Miss Vernon, "and of course a Catholic. No doubt she took that means to avoid joining in what she considered heretical worship.—Are you going, Mr. Annesley?"

"I am reluctantly compelled to do so," said Mr. Annesley, who had drawn Ilderim from the carriage-door, and himself from that soft contact of silk and lace; that near neighborhood of a slender, well-gloved hand; that faint, dainty fragrance of fresh millinery; that capricious parasol fringe which was never still, and which would persist in sweeping his face, and that subtle, intangible charm which, like an aroma, seems constantly exhaling from a lovely and well-dressed woman—"I am compelled to do so—for here is Morton House, and to it I am bound. You dine at Annesdale to-day? Then you may expect a full account of the wonders and mysteries within these gates. Good-morning."

He lifted his hat—the ladies bent their heads with a general flutter of plumes and ribbons—the carriage swept on in a yellow cloud of dust, and the young man found himself alone before the gates of Morton House.

Like his mother, he too felt, when those gates closed behind him, as if he had entered an enchanted domain—a domain over the neglected beauty of which there rested a mournful stillness, deeper and more pathetic than mere solitude; where brooded a solemn air of repose, and a subtle power of awaking thought and association which we have most of us observed in those places where life once ran riot, and from which it has long since departed forever.

The young man involuntarily bared his head as he rode slowly along beneath the drooping trees; and patches of golden sunshine, flickering softly down, fell on the rich black curls and the face that was subdued almost to mournfulness. There was to him an indescribable pathos in the stately quiet around him. He thought of the by-gone voices that had once sounded along this avenue, of the gay hearts that had gone their way brimful of life and joy, and the sad hearts that had found even the beauty of Nature a weariness and a

mockery—well, they were all equally at rest now. He thought of the bright children who had played beneath those trees; and of the fair ladies who had dreamed sweet fancies under their shade, or—who knows?—dropped bitter tears upon their mossy roots. The sod lay heavily enough over those lovely faces now; and it mattered little whether they had known most of the smiles or of the tears. Then he thought how often his father had passed here, with all manhood's brightest hopes stirring at his heart, and all manhood's proudest resolve in his breast—yet how little either the hope or the resolve had availed to change his fate. Morton felt a bitter pang at the recollection of that father who had gone so early out of his life, but whose memory had ever remained with him as a vision of all that was most noble in simple chivalry—a lesson which had done more to mould the boy's character than all the precepts of living teachers. And he was going now to see the woman whose fatal beauty had wrecked the happiness of that father's life! He knew—everybody knew—that Edgar Annesley had poured out his love like water at Pauline Morton's feet, and that she had scorned him as she scorned all others in that proud heyday of her youth and power. And now there seemed a retribution in the fact that Edgar Annesley's son came forward as her sole defender against the fickle world that had once fawned at her feet. "It is the only revenge he would have wished," thought the son, placing, as he always did, the father in his position. "But he would never, for one moment, have considered it revenge. He would have regarded it as a duty, and thought himself happy in performing it. Ah, I shall never master the whole essence of his knightly creed and practice—he who was a very Bayard, and yet thought that he only fulfilled the common duties of a gentleman." And here, after all, had been the great secret of that resolution which so much surprised Mrs. Annesley. The young man had set out in life feeling himself his father's representative, and he had never felt this more than when slander set its mark on the woman his father had loved. He had spoken to his mother as a Morton; but his warmest interest in Mrs. Gordon's cause rose from the fact that he was an Annesley. There, indeed, rose his true animating impulse; and there was an anchor to hold him steadfast through any opposition.

Suddenly, when he was about half-way to the house, a sound broke on the stillness—a shrill, childish voice that caused Ilderim to start and prick up his satin ears with ominous haste. When he had been brought to order, Annesley was able to comprehend that words of alternate entreaty and command were apparently being addressed to himself by some unseen person.

"*Holà! Monsieur! monsieur, come here!*" cried the voice, in a strange mixture of French and English. "*Pardonnez-moi, but that nasty Babette—*"

The rest was lost in consequence of a sudden movement on Ilderim's part, which demanded all his rider's attention. When this exigence was passed, Morton stared about him in utter bewilderment, for "the silence was unbroken, and the stillness gave no token" of any human presence beside his own.

"Who is there?" he demanded at last—sending his own voice in the direction from which the other had proceeded. "*Holloa!—who is there?*"

Then the same childish tones replied, impatiently:

"It is me—Felix Gordon. I wish you would make haste, *mon-sieur*, for my arm is very tired."

Guided by the voice, Annesley now saw in the grove on his right a small figure clinging half to the trunk and half to the lower limb of a large tree, and thus suspended fully fifteen feet above the ground.

"Good Heavens!" he cried. Then, springing from his horse, one or two quick bounds carried him at once to the foot of the tree, where he perceived the peril of the child's position more clearly. The limb had evidently broken under him, and left him clinging with one hand to a fragment of it while he braced his feet against a gnarled knot of the tree, and thus partially relieved himself of his own weight. But it was only partially; and relief from the precarious position was impossible without the aid which had so opportunely and so accidentally arrived.

Morton did not waste any time in words. He saw that the face which looked down upon him was very self-possessed; but he also saw that it was very pale, and marked the painful rigidity of the attitude. He threw his gloves near a small velvet cap that lay on the grass, and the next moment was climbing the tree with the agility of a school-boy.

But when he began to approach the child, he saw that caution was necessary, or he would dislodge the boy's foot and send him crashing to the ground, for he could do little more than steady himself by his hand. Therefore, the rescuer crept carefully on the opposite side of the trunk, hardly allowing himself more than the merest clasp of it, and, when he was once safe among the boughs, ascended to a considerable height before he paused. Then, with extreme care, he descended from limb to limb until he reached the one immediately above the boy. There he seated himself, and finding it secure spoke for the first time.

"Now I am going to draw you up to me. When I take hold of your collar, you must let go the clasp both of your feet and your hand. Don't be afraid; for I shall not let you fall."

"Ma foi! I am not likely to be afraid," said the boy, half-scornfully. "But, if you are going to do it, you had better make haste."

Bending over, Annesley took a firm grasp of the clothing that encircled the soft young neck, and with one vigorous lift placed the child before him.

His eyes were closed, and he was white to the lips, so that at first Annesley thought he had fainted. But the next instant the fringed lids lifted, and a smile of triumph came over the pale face.

"Babette said I could not do it; but I *have* done it," he cried. "It was not my fault that the limb broke."

"It was not your fault," said Morton, kindly; "but it was an accident which is likely to happen at any time, and you must not risk your neck in this way again. I may not be within call next time."

"No," said the boy. He glanced rapidly and somewhat wonderingly over the face and form of his deliverer. "I am very much obliged to you, monsieur," he added, with the grand manner which had impressed even Mrs. Annesley. "But, je ne sais—that is, I do not know you."

"I am your cousin," answered Morton, smiling; "and my name is Annesley."

"Ah!" said the boy; and as he strove to steady himself by altering his position, he gave a faint cry of pain. "It is nothing," he said, quickly, in answer to his companion's look of inquiry, "only my arm—I hurt it."

"How?"

"When the limb broke. Ah, I should have got down if I could have used it—but I couldn't, you know."

"Let me see if it is much hurt," said Annesley; and, after the child had unflinchingly borne an examination, he pronounced it only sprained. "The bone is all right," he said; "but you were a brave fellow to hold on with one arm when the other was in this condition."

"I'd have hurt both, if I had fallen," said his new acquaintance, with a half-comic grimace—adding quickly, "but, monsieur, let us go down."

"I have been thinking how we shall manage that, and I don't see very clearly yet. This is the first thing to be done." He drew a small flask from his pocket, and held it to his companion's lips. "Drink, my boy—it will burn your throat, but never mind that—you need it."

The boy drank eagerly—far too eagerly, Annesley thought; for he soon drew the flask away.

"That is enough—I don't want to unsteady your head for the descent."

"Bah!" said the child, in the scornful tone which came so strangely from his childish lips. "Bah, monsieur! Do you think I could not drink twice that much, and be steady yet?"

"I should be sorry if you could," said Annesley, gravely.

The dark eyes flashed upon him suddenly. "Pourquoi, monsieur?"

"Because it would show that you must have had very bad training," said Morton, quietly. "No child of your age ought to know the taste of brandy—much less, drink it as you did just now. Who gives it to you?"

"Alas! no one now," answered the boy, with candid regret. "Papa gave it to me sometimes—but that was only to worry mamma—and St. John gave it to me very often."

"But surely your mother does not like it to be given to you?"

The small shoulders achieved a Gallic shrug which was simply per-

fect. "I should think not, indeed, monsieur! Mamma will not even let me drink a glass of wine—and Babette, nasty thing! always tells her if I do."

"Then, if I had been in your place," said Morton, impressively, "I would not have taken that brandy, unless your mother had given it to you herself."

The boy gazed at him wonderingly. "Monsieur, why not?"

"Because I should have felt bound by her wishes, especially as she was absent," said Morton, as gravely as befitted the character of Mentor, with which the occasion had invested him. "A trust, my boy, is a thing which cannot be held too sacred. Come, I see you are very sensible, and I need not talk to you as I would to most children—I can speak to you almost as if you were a man. You mean to be a gentleman, do you not?"

"I am a gentleman," was the quick reply.

"I am glad to hear you say so. But do you know what is the chief thing that makes a gentleman? Not blood, not birth—they are good in their way, but they won't do by themselves—not any one thing so much as the capability of being trusted."

"Mamma says so—but she is a woman."

"Well, I am a man, and I tell you the same thing. What is more, I tell you that nobody who bore the Morton name was ever lacking in this capability. Look round! do you see all this, which will be yours some day—these noble trees, and those broad fields yonder? Well, the men who owned all this before you were men who, if a trust had been given them, would have held it till they died—held it as you held that limb a little while ago. You are a Morton in courage, why not be a Morton in honor as well?"

The sudden question took his listener entirely by surprise. He looked up—still with wonder—into the earnest face which bent over him, as he said, slowly, "I am a Gordon, monsieur."

"I know. But you are a Morton also; and, whatever the Gordons were, the Mortons, at least, have always been brave and loyal gentlemen. I could tell you many a story about the men of your name—and then, perhaps, you would think that such a name was worth bearing."

"Tell me," said the boy, eagerly. "St. John used to tell me about the Gordons; and I liked to hear how they killed men and ran away with women, and drank wine and brandy."

"Then I am afraid you would not like my stories," said Morton, "for I have nothing of the sort to tell you. The men of whom I speak never did any of those things. They were simple, honorable gentlemen, who lived quiet lives, but who knew how to be true to their friends, to honor their God, and to serve their country; but not one of them would have put that flask of brandy to his lips!"

Felix's large eyes opened widely. "Monsieur! Did none of them drink brandy?"

"Oh, yes," said Morton, "I suppose all of them drank brandy, and sometimes more than was good for them. But none of them would have done so if they had been put on their honor not to do it by somebody who had a right to exact such a promise."

Felix looked thoughtful. It was evident that a new light had dawned on his mind—a light very different, when presented by this handsome young cavalier, to that which had been urged by his mother. At last, as he did not speak, Annesley broke the silence.

"Now, we must get down, or your mother will be uneasy about you. Were you alone when you climbed up here?"

"No; Babette was with me. She said I should not do it, and I said I would—and I did! She tried to hold me; but she isn't strong, though her arms are so big; and, when I kicked her, she had to let me go."

"Who is Babette?"

"My *bonne*," answered the boy, with a grimace. "St. John says I am too old—I shouldn't have a *bonne*."

"But, as you have got one, you ought to treat her properly. I am sorry to hear of your having acted as you did. Horses kick—not gentlemen."

"St. John says I ought to torment the life out of her, and then she will go away."

"And then your mother would get another, perhaps a worse one. Who is this St. John? He seems to have given you very bad advice."

"He was papa's secretary, and I liked him; but mamma hated him."

"Then you certainly ought not to obey him so well. Now let us

move forward. How does your arm feel?—well enough to bear a weight?"

"N—o," said Felix, regretfully. "What do you want me to do?"

"I wanted you to clasp your arms round my neck, while I go down the tree. But we must compromise with your feet. Do you think you can hold on with them?"

The boy laughed. "It will be funny," he said, "but I think I can."

"This way—let me lift you to my shoulder. Are you firmly seated? Now, hold tight—take a grasp of my collar."

"I'll do it."

And he did do it, with a vigor which threatened strangulation unless their descent was very speedy.

"Here we go!" said Morton, gayly. "Pity we haven't got an audience for this feat in gymnastics." And, lightly swinging loose from the bough on which they had been perched, he clambered down the trunk, without in the least seeming to feel his burdened condition.

In less than a minute they were standing on the ground laughing together in friendly good-fellowship. Ilderim had taken his departure some time before, so the sylvan solitude was all their own.

"Now for this arm of yours," said Morton. "It must be attended to at once; and your clothes are considerably the worse for your mishap. What will your mother say?"

The boy shrugged his shoulders. "She will think of *this*," he said, touching his arm. "Babette will scold about the clothes."

"Oh, I dare say you can hold your own against Babette. Is the avenue the shortest way to the house?"

"No; I'll take you a shorter one."

They set forward amicably, talking as they went. And, as they talked, it would be hard to say which of them conceived the most cordial liking for the other. On Morton's side it was more than half pity, for he perceived the moral perversion of the child's nature, and read plainly his reckless rebellion against the curb held over him by feminine hands. But he saw the elements of much nobility, together with the proofs of much bravery, and the latter in itself delighted him. The boy's face kindled when he spoke of heroism, and, if it did not kindle when he spoke of chivalry, it was because the principles of chivalry were foreign teachings to his mind—not because the nature was incapable of holding them. Some sinister influence had plainly been at work with him—some influence like that which has marred many another gallant nature—and had indissolubly associated valor with evil, and weakness with good, in the boy's apprehension. Pride of a certain sort had been duly instilled, but it was very far from being pride of a right sort—if, indeed, there be a right sort. Annesley was puzzled by the strange contradictions that unfolded themselves before him. But he was more interested than repelled, and he could not help thinking how pleasant it would be to draw these warped conceptions straight. Perhaps he was something of a Quixote in those early days—too prone to amateur philanthropy. But there was that about him which caused most people to forgive the failing; and, considering how soon such impulsive generosity is cooled and cured by later years, they could well afford to do so. His heart yearned now over this fatherless boy—this boy who was his own kinsman—and even while he talked to him of sports, and dogs, and horses, and on all the topics most dear to a boy's fancy, he was mentally considering how he could gain a sort of right of tutelage over him. It all depended on that unknown woman whom he was going to meet—that woman whose sworn defender he had already constituted himself; and he began to feel more anxiety about her reception of him, than he had suffered himself to entertain before.

This anxiety was soon set at rest; for, as they came in sight of the house, Felix uttered an exclamation.

"There is mamma now, and Babette, too—the horrid thing! They are coming after me."

"Go and speak to them, then," said Morton, quickly. "They do not see you yet. Go at once."

The boy hesitated a minute; but, at the second bidding, he went—speeding like an arrow straight to the terrace-steps, which his mother was hastily descending, accompanied by Babette—the latter talking eagerly, with many gesticulations—while a group of servants followed behind.

Annesley advanced deliberately, an amused spectator of the scene which ensued of Babette's stormy outcries and reproaches, of the mother's passionate caresses, of the half-defiant, half-triumphant story

of Felix, of the interested servants who brought their dusky faces near and nearer—and of the final moment when all eyes turned toward himself.

Then he came forward more quickly, very gallant and handsome in presence, very easy and graceful in bearing, yet with a slight tincture of embarrassment at the semi-heroism of his position.

Mrs. Gordon met him with outstretched hand, and so warm a light in her eyes that he marked none of the ravages of time, but only saw that they had spoken truly who called Pauline Morton's beauty without peer. "Oh, thank you, thank you!" she cried in that soft and melodious voice which had never yet failed to fascinate any one who listened to it. "I owe my darling's safety to you! How can I thank you enough!"

"You must not thank me at all," said Annesley, bending to kiss the fragile-looking hands that had grasped his own—and there was something very courtly in the action, though it was one of unstudied impulse—"or you will make me fear that you forget I have a kinsman's right to serve you and yours."

She read his face all over with one glance of her eyes, then spoke impulsively: "Ah, my kinsman, indeed—for I see you are Edgar Annesley's son."

There was something in the tone which pronounced his father's name that touched Morton's heart to the quick—won it, indeed, for this woman who had wrecked that father's happiness. It seemed to him that in her voice there was an echo of the admiring reverence, the regretful tenderness, which always thrilled his own soul when he thought of that brief life and premature death—an echo he had never before heard on any lip—not even his mother's. He felt that one other beside himself appreciated the spirit which had passed from earth without its due meed of lasting honor; and an emotion of almost passionate gratitude sprung up within him. Perhaps Mrs. Gordon read the meaning of the swift change that came over the frank young face; for she smiled kindly, and, laying her hand on his arm, said:

"Come. Let me welcome my kinsman to Morton House."

And then Annesley found himself led forward into the castle which had been declared impregnable—a paladin, invested for the time being with a sort of chivalric triumph, and quite the master of the situation.

CHAPTER VIII.—THE ADELAIDE.

"Now, Katy," said Miss Tresham, in a tone of authority, "you must say this lesson, my dear—and you must not mumble the words so that I cannot hear them, either. Take your finger out of your mouth, and hold up your head. Now begin—'A verb'—"

"'A verb,'" drawled Katy, "'is a word which signifies to be, to do'—or to do—or—is that all a verb signifies, Miss Tresham?"

"'To suffer,'" prompted Jack, in a loud whisper, with his eyes fastened on the pages of his arithmetic.

"Jack," said the governess, severely, "take your book and go and stand up in the corner, at the other end of the room. In a few minutes I shall see if you know your own lesson well enough to be prompting Katy with hers. You will have to learn a French verb after school, for breaking rules.—Now, Katy, I will give you one more trial. 'A verb is a word which signifies to be, to do, or to suffer.' What next?"

"'As, I am, he runs, she loves.'"

"Very well. Go on." For Katy, having delivered this much in a very loud voice, came to a sudden, dead stop.

"'Verbs are—are of two kinds'—ain't they of two kinds, Miss Tresham?"

"Go on, my dear," said Miss Tresham, with severe patience.

"'Verbs are of two kinds,'" repeated Katy, dubiously, as if the statement was, in her own opinion, a very doubtful one; and there she paused, and fell to twisting the corner of her apron.

"Hold your hands still, and go on, Katy," said the much-tried governess.

"'Verbs are of two kinds,'" repeated Katy, once more, and apparently in a state of despair. "'Verbs are of two kinds'—positive, comparative, and super—"

Here an audible titter from the other scholars was silenced by a look from the teacher, and a well-thumbed grammar was held out to its owner. "Take your book, my dear, and put it aside. After

school, you will have to learn this lesson. Now, children, get your slates and let me see your sums."

A slamming of desks and shuffling of books ensued, followed by the appearance of various slates, more or less covered with cipherings, all of which were submitted to Miss Tresham. She took the one nearest her, and began casting up the column of figures.

There was a temporary silence in the school-room, for all eyes were anxiously following the movements of the governess's pencil, and the only sounds were her strokes on the slate, as she made her firm, round numerals, and the swaying to and fro of some boughs before the open window—boughs that were faintly stirred by a soft, southern breeze, and between which the golden sunshine streamed across the school-room floor, across Katharine's dark-blue dress and bright brown head, across Jack's darned jacket, and Sara's neat check apron, and smooth little tails of plaited hair. Unfortunately, however, this window was directly over the front-door; and when a quick tread was heard advancing up the walk, and into the piazza, followed by a knock which echoed through the house, there was an instantaneous end both of silence and attention.

"Hallo! who can that be?" cried Jack. "I bet it's Tom Ford, come after his gun, Dick! I told you you'd no business—"

"Hush, Jack!" said Miss Tresham.—"Here, Sara—here is the mistake in your sum. When you added up this line of figures, you forgot to carry there—"

"Miss Tresham, if it's Tom, mayn't I go and give him his gun?" asked Dick, anxiously. He had been listening with all his ears to the muffled sounds below, but had failed to distinguish any thing to set his mind at rest.

"I'll go and look over the banisters, and see who it is," said Jack, briskly, and he made a dart toward the door, but was promptly arrested by the governess.

"Come back this instant to your seat, Jack! It does not concern you to know who is down-stairs.—Dick, if it is Tom Ford, your mother can have the gun given to him. Now, be quiet and attend to me. Five into thirty-eight goes how often? I am asking you, Dick."

"Five into thirty-eight," repeated Dick, removing his eyes hastily from the door, upon which they were fixed. "Five into thirty-eight goes—"

"It's Mr. Annesley," announced Katy, in a loud voice.

"How do you know?" demanded Jack, eagerly.

"I heard him," she answered joyfully; and she jumped down from her seat, and ran to the window. "Yes, it's Mr. Annesley—I see his horse!—Oh, Miss Tresham, please let me go down!"

"Take your seat," said Miss Tresham, briefly, "and don't let me hear another word."

"But he will go!" cried the child, turning first red and then pale, "and I won't get to see him at all. Miss Tresham, please let me—"

"Katy, did you hear me tell you to take your seat?"

"But he will go!" repeated she, half-passionately, half-entreatingly.

"Ba—a! Now, cry like a baby about it," said Jack.

"I'll cry if I want to!" was the angry retort.

"I don't think you will," said Miss Tresham, quietly. "If you don't come this instant to your seat, I will lock you up in the closet."

Katy gave a great gulp; but she knew the battle was an unequal one. She remembered how often she had got the worst of similar encounters, and she moved slowly and sullenly toward her chair. When she was fairly seated, Miss Tresham turned again to the arithmetic.

"Dick, you have not yet told me how often five goes into thirty-eight."

"Seven times, and three over," responded Dick, who had, meanwhile, been ascertaining the fact by the aid of his fingers.

"And how often does—"

"Tap, tap, tap," at the door—which was promptly thrown open by Jack, before Miss Tresham could utter a word. A servant stood outside. "Mr. Annesley's down-stairs, ma'am," he said, addressing Katharine.

She looked up and frowned a little.

"Whom did he ask for?"

"For you and mistis both, ma'am."

"Tell him he must excuse me. I never see any one in the morning. You know this, Tom. Why didn't you tell him so at once?"

"I did 'm. But mistis come out, and asked him to walk in, and told me to come up and tell you he was here anyhow."

"He must excuse me. I never see any one in the morning," Katharine said again, and returned to the lesson she was engaged with.

"Yes'm."

The servant disappeared, and blank dismay, seasoned with discontent, settled over the children. They had been unusually trying during the whole morning, and this interruption left them almost unmanageable. They felt that Miss Tresham's refusal to see Mr. Annesley was an outrage on themselves; and the perversity and stupidity with which they revenged themselves would have exhausted any patience less long-suffering than hers. Perhaps it exhausted even hers; but, if so, she did not afford them the gratification of seeing it. On the contrary, she sat, a model of quiet authority, and held them unflinchingly to the task in hand; but it was of so little effect that, when at last the welcome stroke of twelve told their release from the school-room, only Sara was able to close her books and take her departure.

"The rest of you are kept in," said Miss Tresham, looking at her watch, "and it will depend on yourselves whether you get through in time for dinner. If not, I shall leave you here, and send some bread-and-water up to you.—Jack, take Levizac there, and study 'moudre' for recitation; Katy, go to your grammar; now, Dick, let me see if you are still unable to cipher out this sum."

The threat of bread-and-water was not without effect on Dick's hitherto obtuse brain, giving to it a sudden insight into multiplication and division which it had lacked before. With little further trouble the sum was worked out to Miss Tresham's satisfaction; and, when he had seized his cap and scampered off, she was able to turn her attention to the other delinquents, who still sulked in different corners over their respective grammars.

They found the struggle which they had provoked a very hard one: for the young governess stood steadfastly at her post, and never flagged in word or sign all through the weary hour which followed. A very weary hour it was, and, when the dinner-bell pealed through the house, she was looking pale and exhausted, though the battle was fought and won. The two valiant champions had just finished their recitations, and were looking quite crestfallen as they put away their books and closed their desks. Katharine did not even have time to smooth her hair, or add a single adorning touch to her plain morning-costume. Mrs. Marks was very punctual herself, and liked punctuality in other people, especially with regard to meals; so, with one deprecating glance at the little school-room mirror, Miss Tresham ran down-stairs.

As she saw Ilderim still standing beside the front gate, she did not need the sound of a certain ringing laugh, which came through the open door, to tell her that Ilderim's master was in the dining-room. The next minute she was shaking hands with him.

"See how forgiving I am," he said, with a smile. "You refused to see me, and I not only wait your pleasure, but I encroach on Mrs. Marks's hospitality without the least remorse. Have you been victimizing those poor children for the last hour on my account?"

"The matter lies just the other way," she answered. "It is they who have been victimizing me on your account, until I wished that you had timed your visit better. I make no apologies for not seeing you. I believe you know my school-hours."

"I do know them; but I thought you might relax your rule for once, since I have been away so long. However, Mrs. Marks was kind enough to see me, and has entertained me so well that I did not find the time long."

"Indeed, then, Mr. Annesley, you must be fond of hearing about children and chickens," said Mrs. Marks, with a good-humored laugh; "for I don't remember talking about any thing else. I felt sorry for you, but I knew there was no use in going after Miss Katharine. She never will come down in her school-hours."

"And you're quite right, Miss Kate," said Mr. Marks. "Work is work, and play is play, and, in my opinion, the two should never be mixed up together.—Mr. Annesley, let me help you to a piece of this duck.—Bessie, what is that you have before you?"

"Some beef of my own corning," answered Mrs. Marks, with all a housekeeper's pride.—"Mr. Annesley, you must take some, and tell me what you think of it."

Mr. Annesley accepted a mammoth slice, and, with commendable

industry, ate a considerable portion of it, praising it the while highly, it is to be hoped, sincerely.

Then the conversation turned upon the different methods of corn-ing beef, and a grave discussion ensued, in which Morton acquitted himself with credit, and much pleased his host and hostess.

These good people, though even to their own hearts they would not have acknowledged such a thing, were not a little flattered by the attention which it had lately pleased the young owner of Annesdale to show them—attentions the source of which they were shrewd enough to suspect, but which in themselves were no slight tokens of distinction, as distinction was reckoned by the Tallahoma world. Already more than one envious friend had said to Mrs. Marks:

"How often Mr. Annesley comes to see you!"

To which Mrs. Marks replied, quite indifferently:

"Yes, he is so fond of the children, and Richard likes him very much."

Therefore, although she sometimes had serious doubts concerning what was to be the end of his evident fancy for Miss Tresham, she could not find it in her heart to discourage his visits.

"He is such a gentleman—there *can* be no harm in it," she once said to her husband, when she felt an unusual qualm on the subject; whereupon honest Mr. Marks answered in his way:

"Harm, indeed! What harm could there be? I'll warrant him for a gentleman—Edgar Annesley's son couldn't well be any thing else—but, even if he wasn't, I should think Miss Tresham was old enough, and had sense enough, to take care of herself."

On the understanding, therefore, that Miss Tresham was old enough, and had sense enough, to take care of herself, Mr. Annesley's visits had not been discouraged. Indeed, he was so bright a visitor that it would have been hard for any, either gentle or simple, to close their doors to him.

As he sat at the table now, it was wonderful how he managed to adapt himself to the tone of his entertainers. Often gay, always pleasant, and invariably courteous, he talked household economy to Mrs. Marks, politics to her husband, and nonsense to the children, with an ease that amused Katharine. There was none of that offensive air of "You see I put myself on your level," which some people assume when they attempt this kind of thing; but, on the contrary, such a frank charm, such an art, or rather such a gift of throwing, not a pretence, but a reality of interest into every thing he touched, and such a happy power of enlivening the dullest subjects, that the most sensitive person could not have found a shade of patronage to resent. He proved so entertaining that even Mr. Marks lingered over the meal, which was usually a very business-like ceremony; and, when at last he rose to go, apologized for his departure.

"I am sorry to say that I must be going," he remarked, with genuine regret. "But I leave you to the ladies, Mr. Annesley, and I don't expect you'll miss me much."

He knew perfectly well that his young guest had not come to see him; but he could not rid himself of an idea that it was "impolite" to leave him in this way.

But Morton replied that, though he was sorry to lose Mr. Marks's company, he had no doubt the ladies would manage to take care of him. And, as the bank was in need of its cashier, Mr. Marks said good-day, and departed.

Immediately thereupon Annesley turned and looked at Katharine, who was still seated at table, showing Nelly how to eat rice-pudding without sharing it between her dress and the table-cloth:

"What do you say?" he asked, with a smile. "Will you accept the responsibility?"

"Is it a very heavy one?" she inquired. "I expect—ah, Nelly, see how you have spilled that spoonful—I expect to be equal to it, Mr. Annesley, if you won't ask too much in the way of entertainment."

"I will only ask one thing," said he—for they and Nelly had all that end of the table to themselves, as Mrs. Marks was at the moment giving some order to one of the servants at the other, while Jack and Dick squabbled over a custard in the middle.

"Well, and what is it?"

"That you will let this child alone, and come and sing something for me. I have not heard any good music in such a long time. Not since—"

"Since when?" she asked, as he paused.

"Since I heard you last," he answered, with grave sincerity.

Katharine laughed, and made him a little bow.

"After such a compliment, I should be very ungrateful if I could refuse.—Mrs. Marks, will you come with us to the parlor?"

"After a while, my dear," said Mrs. Marks. "But don't wait for me.—You, Jack!—you, Dick!—Tom, take that custard from both of them."

A stormy scene ensued, in the midst of which Annesley and Katharine made an escape, shrugging their shoulders in sympathy as they crossed the passage and entered that gloomy solitude known in the Marks household as "the parlor."

A very gloomy solitude it was, for the children were strictly forbidden to enter it, and, being used only on state occasions, it had none of that air of comfort which pervaded the rest of the house. The stiff horse-hair chairs were ranged with regular uniformity against the walls, while a long sofa, with hard back and harder seat, occupied a position on one side of the fireplace, where a brass fender, polished to the extreme of brightness, enshrined two equally bright andirons and a paper screen of wonderful device. Over the mantel there was a bouquet of flowers, which bloomed all the year round (under a glass shade), a pair of silver candlesticks, a pair of empty vases, and various similar articles, arranged with due attention to mathematical precision. A round table occupied the centre of the floor; and on this reposed various books in gorgeous bindings—chiefly standard devotional works. In a corner stood the piano, and near it a stand on which lay a music portfolio bearing Katharine's name.

The owner of this name gave a slight shiver as she entered the sacred apartment, and, instead of proceeding directly to the piano, she walked across the floor, and opened one of the closed windows. "No, no; not that one," she said, as Annesley moved toward another, with the manifest intention of following her example. "If you open that, it will let in the sunshine; and Mrs. Marks will not allow such a thing, for fear of fading the carpet. Though, I am sure," added she, with a comical glance at the vivid hues spread under her feet, "I think the carpet would be much improved by a little fading. However, that is all a matter of taste. Now, what shall I sing?"

"My old favorite," said Morton, lifting the lid of the piano. "You know what that is."

She smiled, sat down to the instrument, and, softly touching the keys, began to sing the "Adelaide" of Beethoven—that most pure, most tender, most spirit-like strain that ever breathed in immortal tones the common story of our common human love! And as she sang it—as the glorious notes of the great master soared aloft in her rich young voice, as all the sordid things of life seemed to fade away, and all earth to grow more lovely in the divine glory of that tide of sound—it was not strange that the passion which is ever fed by such strains as these deepened on the mobile face beside her until one glance would have told her the story of his heart, without any need of words.

But she did not give that glance. When the song ceased, when her voice fell into silence, and the last vibration of those mournfully passionate cadences had died away, she made an effort to speak lightly; and, without taking her eyes from the keyboard, said, "Will you please look in that portfolio and find me the *Ave verum*? I will sing it for you to-day, though I could not do so the last time you asked me."

Half-mechanically, he obeyed—glad of a moment's time in which to collect himself before the words were uttered that he now felt impelled to speak. Temptation had gone so far, that he could resist no longer. Whatever might be the result, he must lay his heart at this woman's feet, and tell her that it was hers to accept or reject. That magic song had stolen away all his most steadfast resolves; for he had never intended to declare himself thus prematurely. He always had meant to make a formal demand for his mother's consent, and then to woo the girl he loved as if *she* had been the one whom Fortune placed so far above the other. It was always the way of the gallant gentlemen who had borne his name—if poor and humble the maiden whom they loved, they sought her with more state than if she had been the highest in the land. So, Morton had meant to come, when he offered his hand to Mr. Marks's governess; but the sudden force of passion was too strong for him. Words suddenly rushed to his lips, and in another moment Annesdale and all its belongings would have lain at Katharine Tresham's feet, if Fate had not intervened.

But, turning over, with absent mind and careless hand, the sheets of music, he came to a copy of the song he had just heard, the song

which had stirred every fibre of his heart—the sad, passionate, beautiful “Adelaide.” As he took it up, there fell from between the leaves an open letter. He caught it, as it was fluttering to the floor, and almost unconsciously his eyes fell on the first lines. They were written in a man’s hand, and stood out black and clear on the white paper.

“MY DEAREST KATHARINE: I am terribly uncertain whether this letter will reach you, but at least—”

This much Morton could not avoid seeing—more than this, he did not read. Indeed, the hot, sharp pang which shot through his heart sent a mist to his eyes which would have prevented his doing so, if he had felt such a thing possible. Then he strove to steady himself. Might not Katharine, for aught he knew, have brothers, uncles, cousins, a dozen relations, from whom such an address might naturally be permitted? What a jealous fool he was! He would speak to her immediately, and her first look would show him his folly. So he did speak—with just a slight quiver in his voice to betray his anxiety.

“Miss Tresham.”

Katharine turned quickly, and, as her glance fell from his face to the open letter in his hand, Morton’s heart gave a great bound—then suddenly stood still.

For she did not smile in recognition of a friend’s epistle, nor blush that rosy red which greets a lover’s missive; she did not hold out her hand or utter one word—she only turned ashen pale, and shivered from head to foot as if with a sudden chill. There was an instant’s pause: then Morton spoke hastily, as if eager to relieve a possible fear.

“I found this a moment ago, Miss Tresham. Do you leave your letters where any one might find and read them?”

She did not answer—only held out her hand toward him.

“It may not be of importance,” he went on; “but still—”

“It is of importance,” she broke in, passionately. “To think that I should have left it here! I must have been mad!”

She took the letter, and, walking to the fireplace, struck a match, set it on fire, and watched it burn until the last fragment was ashes. Then she shivered once more from head to foot. “I must have been mad!” she repeated.

And there was something in the tone and action which settled like ice upon the man who loved her—the man who, a moment before, had wellnigh asked her to be his wife. He could sooner have put his hand into the fire she had kindled than ask that question now. Not that any suspicion of any kind had entered his mind against her, but simply that he felt chilled to the very heart. The women who had always made his ideals of the sex were women into whose stainless lives there entered no pages that all the world might not read; and not a worldling of the world held more firmly than this chivalric but most fastidious gentleman the great maxim of the world, “Distrust secrecy.”

So, when Mrs. Marks bustled in a few minutes later, her advent was a relief to him as well as to Katharine, and, for the half-hour which ensued, that good woman had all the burden of conversation on her own shoulders.

Then Mr. Annesley found it was time to go; so he made his adieu and took his departure—riding very slowly from the gate where Ilde-
rim had stood so long, and unmindful of the wistful glances sent after him by poor little Katy, whose heart had been set upon a ride.

When Katharine was left alone in the parlor, her first act was to go and toss over the little feathery heap of ashes on the hearth, to see that no end of paper remained. Then she raised her face with a weary sigh, half of relief, half of pain.

“All gone!” she said, aloud. “But God only knows when that may come to me which I can never, never cast from me, as I now cast these ashes!”

[TO BE CONTINUED.]

A ROMANCE OF MOUNT DESERT.

I.

GLENDALF Seminary is situated on the Northern Railroad, about thirty miles from Boston. There, young ladies are educated in “all the accomplishments that adorn society, as well as in those Christian graces that adorn a home.” Miss Philomela Shearer, called by

the lively young ladies under her control “File” and “Shears,” is the principal. This much must be stated to explain the time and place and circumstances of a conversation which occurred one bright, fresh morning in spring in the room of a piquant little brunette, Alice Lennox by name.

A group of girls were standing entwined together in the middle of the room, while a little apart sat another, apparently engrossed in the study of Racine. This studious young lady deserves special mention. Her name was Constance Chamberlain, and she had the beauty and manner that a princess is popularly supposed to possess. Her hair was a chestnut brown, gleaming here and there with golden lights, her eyes rich blue, her mouth beautifully curved, and her complexion wonderfully clear and brilliant. One foot, as is customary with lovely girls, peeped from below the hem of her skirt, and her loose sleeve allowed a singularly beautiful arm to be partially exposed to the gaze of unappreciative female observers.

“Look at that Con there,” said Alice Lennox, “sitting by herself, and not caring a bit to know what we’ve got here.”

“No, I do not,” said Constance; “what is it?”

“Look and see,” said Alice, holding up a pamphlet in a blue paper cover.

“It looks like a catalogue of Harvard College,” said Constance.

“‘Harvard University’ is what is on the title-page,” said Alice; “but you are substantially correct, as File would say.”

“What are you going to do with it?” asked Constance, indifferently.

“We are going to select some names here,” said Alice, “and open a correspondence with their owners.”

“How silly!” said Constance.

“Oh no,” replied Alice, “for File needn’t know any thing about it. I can manage it so that you won’t think us silly at all in doing it.”

“I think it is more than silly, I think it is unladylike,” was the stately reply.

“But, Connie, we shall have letters from the Harvard boys, and it will be such fun,” said Alice, with a pout.

“Fun!” said Constance, with supreme disdain. “You may think so; but I have found boys decidedly stupid,” said this experienced beauty of eighteen years.

“Oh, of course, Miss Chamberlain, you have seen a great deal more than we have, and know much more than we do.”

“I know enough to keep my temper, Miss Lennox, and to avoid a scene,” and Constance swept out of the room.

“There,” said Alice, “she’s in a majestic mood to-day. I say, girls, I’ll tell you what we’ll do to pay her off.”

“What?” said the girls, in chorus.

“Why, send her address to Harvard with ours. Won’t she be furious when she gets an answer? And now let us select a name for her. We must have something romantic.”

“Fitzgerald Perkins,” said a girl, laughing.

“No,” said Alice, “I have decided upon the owner of that name as my property. We must have something very tremendous for Con. Read us out something.”

“George Washington Kenrick.”

“Stupid!” said Alice.

“Henry Kent.”

“Perfectly commonplace,” said Alice. “Go on.”

“Benjamin Franklin Lang.”

“Entirely unsuited to Constance,” said Alice. “Next name.”

“Philip Auchindrane Levincourt.”

“Magnificent!” said Alice, in delight. “Constance shall have him. Hush! here’s File.”

During the course of the day, Miss Lennox decided that, Philip Auchindrane Levincourt being a gorgeous name, she would appropriate it herself, while, to still further humiliate the friend of her soul, she would place her at the mercy of unromantically-named Perkins. The deed, once resolved upon, was promptly executed.

The class of 18—, at Harvard, is acknowledged to have been the best class of its decade. It was to this class that most of those who received letters from Glendale Seminary belonged.

Philip Auchindrane Levincourt was reclining on his lounge in a smoker’s reverie after supper, when a knock was heard at the door, and Fitzgerald Perkins and Aleck Jameson entered the room. Philip Auchindrane Levincourt was a small, round young person, with

plump contours and a pleasing dimple in his chin. He was celebrated throughout Harvard as a "rougher." A rougher is a person who, by sarcasm of an intense and not always delicate nature, can make one person in a group of three or four utterly uncomfortable. Roughing had been reduced by Ady Levincourt to a fine art. Be it here recorded that "Ady" was the natural abbreviation of "Adeps," which appellation, bestowed on Levincourt in his freshman year, had clung to him ever since. Ady's other specialty, besides his excellence as a rougher, lay in his rendering of the *soubrette* parts in college theatricals, which he acted in the most approved and conventional manner.

Fitzgerald Perkins, who entered the room of Ady Levincourt, was very handsome, and a thoroughly-refined and gentlemanly fellow. His hair was brown; his mustache, which was pleasing and symmetrical in shape, was a light hay-color. His character was high, and his trousers were not only faultless, but had a certain air of cultured manliness about them that won the hearts of all who knew him. Nature had been very liberal in her gifts, as if to atone for his slightly-absurd name, though, as he was of the Perkinses of A—, and not of the Perkinses of B—, this name, without the Fitzgerald which preceded it, would not have been an annoyance.

"There are Perkinses and there are other Perkinses," Ady Levincourt was in the habit of saying. "Fitz, as you will perceive by his manner, gentlemen, does not belong to the other Perkinses."

Aleck Jameson and Fitzgerald Perkins being seated, Ady Levincourt opened conversation:

"I know what you fellows are going to say—you've received letters from girls in Glendale Seminary. Don't get conceited over it, for every blackguard in Harvard has got one."

"Have you got one, Ady?" asked Aleck Jameson.

"That is quite good for a repartee," said the imperturbable Levincourt. "In its varied forms, that repartee has always been a favorite of mine. But, to tell the truth, I have received a card with 'Please reply' in the corner, and the name of the gay young female who sent it is Alice Lennox."

"The name on mine," said Aleck, "is Susan; but the handwriting being simply devilish, I have not yet deciphered the rest."

"The best of it is," said Ady, "that I have met an Alice Lennox, who must be my correspondent, though I was never introduced."

"What sort of a girl was she, Ady?" asked Fitzgerald Perkins.

"Pleasing," said Ady, conclusively. "She wasn't one of your swanlike beauties; but, then, I like a duck much better than a swan, you see. The duck is a much more companionable bird."

"What shall you do about your note, Ady?" asked Aleck.

"I shall write her a very gushing answer," said Ady, "and continue the correspondence until examinations come dangerously near."

"I was going to write to mine," said Aleck Jameson, "but Fitz advises me not to."

"No, I don't," said Fitz; "but I say that a girl who exposes herself to the comments of fellows in this way is unworthy my respect, and I want nothing to do with a woman whom I cannot respect."

"The knightly Perkins," said Ady, as if quoting, "did then give utterance to sentiments of an exalted character regarding woman, holding him base and no true knight who should gainsay his words. But, alas, in the veins of all men flows not the blood of the Perkinses, so that the *Sieur Alexander de Jameson* and the *Sieur Philippe de Levincourt*—"

"Oh, do stop that bosh!" said Fitzgerald. "I don't advise, I only act for myself. You fellows can do as you like."

"Thanks for the gracious permission," said Ady. "What is the name of your female?"

"I shall not tell any one that," said Fitzgerald.

Then it was that a demoniac idea entered the brain of Ady Levincourt. He was observed by his friends to chuckle disconnectedly several times during the evening, and, as they were leaving his room, Fitzgerald remarked:

"You are plotting some mischief, you little wretch, and I believe it's about those infernal letters. I wish they had never come."

And, the moment they had left the room, Ady Levincourt went to his writing-desk and began a letter to Miss Alice Lennox. And this letter, which, as a piece of verbose nonsense, could not easily have been equalled by any other fellow in Harvard, he signed with the name of Fitzgerald Perkins.

"The girl that wrote to him won't get an answer," he said to himself, while getting into bed; "while, at the same time, he will be supposed to have written to another girl, who will be insulted at not hearing from me. I rather guess there will be a row among the petticoats at Glendale Seminary."

And, with a final chuckle at the prospect of affairs, Philip Auchindrane Levincourt went to sleep.

II.

Allow me to introduce to the reader Mrs. Higgins, of Mount Desert. Whether it is Mrs. Joel Higgins, or Mrs. Hiram Higgins, or Mrs. Bildad Higgins, I do not mean to state. There are between thirty and forty Mrs. Higginses upon the island of Mount Desert, and I do not mean to incur a libel suit by telling the reader which one I am now introducing. However, as all of them write poetry, and receive guests during the summer, my description will do for any one of the number.

By some sort of feudal fief, the cottages at Mount Desert come under the dominion of the hotel-keepers. Mrs. Higgins placed her cottage at the disposal of Captain Higgins. Captain Higgins is not this Mrs. Higgins's husband, but he keeps an hotel; whether by Captain Higgins, I mean the older Captain Higgins, or the younger Captain Higgins, or the other Captain Higgins, I shall not state, for reasons similar to those mentioned in the case of Mrs. Higgins, but I will simply give the conversation between the male Higgins and the female Higgins. It was the third or fourth week of the season. Said the female Higgins to the male Higgins, "Do you want any rooms?" Said the male Higgins to the female Higgins, "Well, I've got two folks on hand." The female Higgins then inquired, "Be they male or female?" The captain's brief and concise answer was, "Fellows, both on 'em." "I will take them," said the female Higgins, with alacrity, and thus it was that two young men went to live in the Higgins cottage, taking their meals across the road, at the hotel of Captain Higgins. To properly understand this arrangement, the reader must be careful not to confound the two Higginses. Then, and only then, will he be able to bear the announcement that these two young men were Fitzgerald Perkins and Philip Auchindrane Levincourt. The young men were received by Mrs. Higgins with effusion.

"I suppose that you young men are from Cambridge," said Mrs. Higgins, leading the way to their room.

"Yes, dear madam," replied Ady Levincourt, with unnecessary fervor.

"I have wanted the advice of some talented young man," continued Mrs. Higgins, "to aid me in naming my cottage. You may perhaps not be aware of it, but I am literary."

"I should have known it," said Ady Levincourt.

"Yes," said Mrs. Higgins, "I had a hundred and forty-odd poems writ, but our woodshed, where they was stored, took fire, and I don't suppose I shall ever get time again to make up for their loss. But I was thinking of naming this here cottage Ravine Lodge. How does that strike you?"

"It's a sweet name," said Ady.

"But why call it Ravine?" asked Fitzgerald.

"Because there is a ravine," said Mrs. Higgins—the good lady pronounced it "rayvine," by-the-way—"at the other end of the island. Nothing hain't yet been named for it, and why shouldn't this house? Ain't this house worthy of a name?"

"Most assuredly," said Ady Levincourt. "You must excuse my friend, for the fact is, he has been unhappy in love."

"Ady, hold your tongue," cried Fitzgerald, angrily.

"Do tell!" said Mrs. Higgins.

"He is of noble blood," continued the irrepressible Ady. "He is distantly related to the great English nobleman, the Duke de Perkins."

"The Duke de Perkins! Well, to think!" said Mrs. Higgins, in awed delight, as she withdrew.

"Ady Levincourt! I shall go home in to-morrow's boat, thanks to you for making me ridiculous before that woman."

"Now, don't fly off at a tangent," said Ady. "La Higgins is interesting, and she'll treat you magnificently, I've no doubt. What an admiring look she gave you as she went out! By Jove! I'll bet she addresses you as 'Your grace' before long."

"Chuckle away, you little wretch, and be hanged to you," said Fitzgerald, laughing in spite of himself.

During the next two days Mrs. Higgins did not appear before them. On the third day she knocked at the door, and, with a courtesy to Fitzgerald that sent Ady Levincourt into convulsions of laughter, she said: "I thought you young gentlemen might like to know that young ladies are a-coming to this house. Two young ladies, with Miss Dorothy Shearer, who has been here before, and who never makes no bother."

"Shearer!" said Ady, "the name is familiar."

"Her sister keeps a female school," said Mrs. Higgins, "and is a spry woman; but Miss Dorothy is quiet, and good-natured, and meek."

"Quiet, and good-natured, and meek," and with young ladies in her charge. Oh, rapture!" said Ady Levincourt, as Mrs. Higgins withdrew.

"Provided the young ladies are pretty," said Fitzgerald.

In the evening the expected guests arrived. Mrs. Higgins performed the ceremony of introduction in a somewhat original manner, which may perhaps explain the state of surprise in which Fitzgerald appeared to be plunged when introduced to Miss Constance Chamberlain, and the curious expressions on the faces of Ady Levincourt and Alice Lennox. To the justice of this last-named pair, it should be stated that any confusion that either of them may have felt was quite eclipsed by enjoyment of the ludicrous position that they felt affairs must soon take. On Alice's side was a vigorous determination to flirt with this Philip Auchindrane Levincourt, and so to punish him for not answering her note. Equally was she determined to ignore and avoid Fitzgerald Perkins, whose correspondent she had been. On Ady Levincourt's side was a deep regret that, by his own action, he had placed Fitzgerald Perkins ahead of himself in the favor of this pretty little girl, and an equally deep determination to cut Fitzgerald out. He knew Fitzgerald was reserved and proud, and that there was therefore little danger of exposure, and he resolved to confess the whole truth when affairs took a clearer shape.

As for the other pair, Constance was pleased and interested in Fitzgerald at the first glimpse of him, though she knew very well that he would go and be silly like the rest of them. "To be silly" were Constance's words for describing the general conduct of her adorers. She was doomed to disappointment for once, however, as Fitzgerald Perkins had himself been flattered and admired; and, although dazzled for a moment by the splendid beauty of Constance, he remembered receiving a card from her with a feeling of distaste, if not of disgust. Fitzgerald was no strait-laced prig, neither was he possessed of morbid delicacy; but he held certain old-fashioned ideas in regard to the modesty that once was considered a woman's rarest charm, and these ideas made him shrink from such a slightly-fast girl as he imagined Constance to be.

The group of guests stood in the little front room of the cottage as Mrs. Higgins finished her introduction.

"And now," said Mrs. Higgins, "I have washed the dishes and swept up, and I'm going to take a pencil and half a sheet of paper and go up-stairs to make up some poetry. Poetry naturally occurs to my mind from the sight of them four young things standing there and looking as if they was all meant for each other."

The four young things looked both amused and vexed by this remark, and poor Miss Dorothy Shearer, from her arm-chair in the corner, cried out:

"You really mustn't talk so, Mrs. Higgins. Philomela never would forgive me if she knew such things were said, even by accident."

"You needn't be alarmed on our account, Miss Shearer," said Fitzgerald.—"Come, Ady, I'm going over to the hotel;" and, with an easy bow, Fitzgerald left the room.

"Won't you ladies come, too?" asked Ady.

"I should be delighted to," said Alice.

"I am too tired," said Miss Dorothy, and Constance simply declined, so that Ady had the satisfaction of a little stroll across the field with a remarkably nice girl leaning confidently upon his arm. Once at the hotel, Alice found some friends, and the merriment grew fast and furious. Inside the parlor the kerosene-lamp sent its light dimly over the table where three flies were gorging themselves on a sticky piece of candy, carelessly left by some child between the "Lives of the Three Mrs. Judsons," which book was the property of Captain Higgins, and the last new novel, which belonged to some one of the guests. Outside, groups of people sat on the piazza, or sauntered in pairs through

the yard, while down by the fence a knot of Harvard boys sang songs of a somewhat exuberant character, which were duly applauded.

Fitzgerald Perkins did not seem as lively as usual, that evening, and, before the singing was concluded, he left his friends and strolled slowly back to the cottage. It was bright moonlight, and all the beautiful landscape around seemed tinged with a silvery halo. He had almost reached the cottage before he fully realized the beauty of the night, and then he flung himself at full length on the grass, regardless of consequences, determined to enjoy the scene. His eye rested on the front of the cottage, upon which the radiance of the moon fell in shadowed softness. Out of the window of the second story, beneath the gables of the roof, which seemed to form a quaint old frame for it, looked the lovely face of Constance Chamberlain. She was evidently lost in reverie, and, as he gazed on the sweet eyes and curved lips, the beautiful arm, partly bare, and the magnificent hair, which, falling loosely over her shoulders, seemed bathed in the glow of the moonlight, it seemed to him to be the most wonderfully-beautiful picture he had ever seen. For but a short time he gazed, as voices and footsteps were heard, and the beautiful vision hurriedly disappeared.

The voices came nearer. He heard one—apparently a girl's—say:

"Wasn't it jolly at the hotel this evening?"

Then the other voice, which to his astonishment he recognized as Ady Levincourt's, replied:

"I liked the walk over there and back better."

The words and the tone alike seemed slightly tinged with sentiment; but, strangely enough, Fitzgerald did not feel inclined to laugh. He followed the two people from whom the voices came, then delayed a while at the cottage-door, looking up once or twice again at the window in the second story, but in vain. Finally he turned impatiently, and went up-stairs to bed. Ady Levincourt was there, apparently asleep. Fitzgerald knew it was all pretence on Ady's part; yet, for some strange reason, he took no notice of it, and both of them went to sleep without a single word of roughing passing between them.

III.

Sleep partially undid the effect of the previous evening upon Fitz and Ady; so that on the next morning they began to rough each other before they were out of bed, and continued this pleasing amusement until they were down-stairs. Then Ady, instead of starting with his usual alacrity for breakfast, sought a dozen excuses for delaying a while at the cottage.

"Don't be ridiculous, Ady," said Fitz. "You're hanging around here for an opportunity of trotting off with those girls. Hang and be hanged, then! You want female society; I want my breakfast."

"But, Fitz," asked Ady, "won't you wait for me?"

"No," said Fitz, with unnecessary asperity, "I won't."

But he did, though, for at that moment the ladies descended the stairs—Miss Dorothy placid and comfortable, Constance with an air of expectant homage, and Alice Lennox with a smile which was aimed directly at Fitzgerald. The cause of this smile arose from the young lady's reflections during the night. Having at first ignored Fitz, whom she supposed to be her correspondent, and having flirted judiciously with Ady, who she supposed had insulted her, she now felt it time to alter her course, in order to properly accomplish her designs for the discomfiture of both of them. But her fascinations were powerless with Fitzgerald. He bowed to her and to Constance, and then very quietly offered his arm to Miss Dorothy, and calmly walked to breakfast with her.

"Well," said Alice, "there is no accounting for—"

"Tastes?" suggested Ady.

"No—for boys' actions," said Alice.

Constance, in the mean time, had walked away, hardly liking the novelty of being in the same house with two young men who did not seem inclined to be silly.

"Let me offer you my arm," said Ady, insinuatingly.

"You are not complimentary," said Alice.

"Why not?" asked Ady, aghast.

"To imply that I need help, like poor old Miss Dorothy," was the reply.

"I didn't mean any such thing," returned Ady.

"You ought to talk so that people can understand you, then," said Alice; and, having thus logically crushed her victim, she announced

her intention of catching Constance, and skimmed away from her infatuated admirer.

Ady did not follow. Running was not a favorite exercise with him, and, besides, he was fearful that she was offended. Following her slowly, he reached the breakfast-table, and found his companions seated in the following order:

Alice, Constance, Miss Dorothy, Fitzgerald.

"Where am I to sit?" he asked.

"Below me," said Fitzgerald, who had with heroic fortitude managed to place Miss Dorothy between himself and the too-dangerous Constance. Even with this precaution, he was thrilled from time to time, as he leaned back in his chair, by the glimpses he caught of a mass of golden-chestnut hair, against whose rich color, as if on a background, Miss Dorothy's pudgy little coil seemed outlined.

"If Mr. Levincourt," said Alice, "had not deserted me, his breakfast would have been warmer."

"Deserted you!" said Ady, naively; "why, you ran away from me!"

At this, Constance laughed. Her laugh, though subdued, was singularly clear and melodious; and, to resist its influence, Fitzgerald was obliged to devote all his energies to the steak on his plate, which he attacked with ferocity. Had the steak been of the consistency of ordinary steak, Miss Dorothy would have supposed that he was gnashing his teeth, and would have fled in terror; but luckily the steak was of that inflexible nature peculiar to Mount Desert, and so no one noticed him.

For some time the breakfast continued in silence; then Alice Lennox said, sweetly:

"Shall I pass you the eggs, Mr. Perkins?"

"I never eat eggs," said Fitzgerald.

"Why, I've seen a letter of yours," said Alice, meaningly, "in which you expressed a liking for eggs in very strong language."

"I was not aware that you had ever seen any letter of mine," said Fitz, "and, if I said I liked eggs, I wasn't telling the truth." And, as he said this, he rose and left the table.

"He's not telling the truth now," said Alice. "I have seen letters of his, and I remember this one particularly. 'What gastronomic indulgence can plunge the mind in such depths of contemplative speculation as eating an egg—the germ of future existence, the connecting link between the old life and the new'—dear me! Mr. Levincourt, what is the matter?"

For Ady Levincourt, with a purpled face, had uttered some inarticulate sounds, which seemed compounded of a suppressed shriek and a guttural chuckle.

"Don't mind me," he said; "it's nothing;" and precipitately withdrew.

"Well," said Constance, "they are a pair of very rude young men. I hate to have people bore you and be silly; but to show us absolutely no attention is uncivil."

"You are partly right, Connie," said Alice. "Mr. Levincourt has been very gentlemanly to me since he has seen me, though I must acknowledge that Mr. Perkins acts very strangely."

"Don't say a word against Mr. Perkins, you foolish girls," said Miss Dorothy, with surprising warmth. "He is, without exception, the most polite and agreeable young man I have met for many years." And with this remark Miss Dorothy subsided into her usual quiescent state.

Thus did the days go by. Alice Lennox and Ady flirted, and Fitzgerald and Constance were on terms of distant civility. Ady Levincourt was several times on the point of acknowledging his guilt to Fitzgerald, but was dissuaded from so doing by the fear that Fitzgerald, in revenge, would devote himself to Alice, with whom poor Ady was now ridiculously and desperately in love. One person in the house had divined Ady's secret, and that was Mrs. Higgins, who felt called upon to behave in a disagreeably confidential and sympathizing manner to Ady in consequence.

When she met him going up or down stairs, she would mysteriously allude to love and roses, and state that youth was the spring-time of life.

"It is my opinion, Mr. Levincourt," said Alice Lennox, after witnessing one of these demonstrations, "that you have inspired a hopeless passion in the breast of Mrs. Higgins."

"Now, don't," said Ady.

"Taint me he loves, Miss Lennox," said Mrs. Higgins, "but some

one do possess his heart. Some folks is war-horses, and some folks isn't. Them two"—indicating Fitzgerald and Constance, who, strangely enough, happened to be together in the garden without—"are war-horses. But neither of you are war-horses."

"Very true," said Ady; "but what of it?"

"Simply this," resumed Mrs. Higgins; "let them as is war-horses take to them as is war-horses, and let them as is not war-horses take to them as is not war-horses, and so shall the designs of Providence be fulfilled."

Saying which, Mrs. Higgins went majestically out of the room.

"Nice woman, isn't she?" said Ady, tranquilly.

"I think her excessively disagreeable," said Alice, with a heightened color. "I'm going out to see Constance."

Meanwhile Constance had fairly lost her heart. Fitzgerald, showing no symptoms whatever of becoming silly, her other admirers on the island, who were numerous and devoted, grew insupportable. The poor child looked at her face in the cracked looking-glass that Mrs. Higgins had placed in her chamber, to see why Fitzgerald did not admire her, and then cried till she reflected that tears would make her eyes red and render her chances less than ever, whereupon she stopped with great rapidity. But the end was at hand, and the troubles of Mrs. Higgins's four young things were soon to reach a climax.

It was twilight. In the porch of Mrs. Higgins's cottage Ady Levincourt sat smoking. Inside, Miss Dorothy dozed peacefully in her arm-chair, while Constance and Alice, mutually entwined in the fashion peculiar to young girls, looked out of the window.

Unconscious that they were near, Ady smoked and whistled various popular melodies for his own amusement, stopping occasionally to chuckle over some reminiscences of the past and anticipations of the future. Suddenly he saw Fitzgerald coming toward the house.

"By Jove, Fitz," said he, heartily, "I'm glad you've come. Sit down and talk a little."

"What is there to talk about?" said Fitzgerald.

"Lots," said Ady. "We've only a week longer to stay here."

"Are you sorry for that?" asked Fitzgerald.

"Yes, I am," said Ady. "It's a jolly place naturally, and the additions to Nature, in the shape of works of art or nice girls, are refreshing to the masculine mind."

"Nice girls!" said Fitz, contemptuously. "Don't be unnecessarily plural. You mean Alice Lennox."

"Well, she is nice, now, isn't she?" said Ady.

"Perhaps," said Fitzgerald, "but her friend is about seventeen times as beautiful. I despise both of them though, as I do all girls who do such foolish things."

"Such foolish things as what?" asked Ady.

"You know well enough," replied Fitzgerald. "Didn't you tell me about a letter last term?"

"Signed Alice Lennox," said Ady. "What a fuss about nothing! Why shouldn't a girl have a little fun as well as a boy?"

"Because a girl is not a boy," said Fitzgerald. "You don't mind, but I do. I can't bear Alice Lennox just on that account."

"Well, that shows bad taste," said Ady; "but why in thunder are you down on the pair?"

"Because they are a pair," said Fitzgerald. "Ady, Constance Chamberlain wrote to me when Alice Lennox wrote to you."

"What do you mean, Mr. Perkins?" said Constance, from the window.

"I beg your pardon," said Fitzgerald. "I did not know you were there."

"Of course not," said Constance. "But what do you mean?"

"Well, briefly, what I said," replied Fitzgerald. "You chose to open a correspondence with me, and I did not choose to continue it."

"Mr. Perkins," said Constance, coming out into the porch, pale and beautiful, "you have insulted me most shamefully. I knew you disliked me, but I did think you too much of a gentleman to utter falsehoods about me. I never wrote a word to you in my life." And Constance began to cry.

"Oh, forgive me!" sobbed Alice Lennox, suddenly emerging from the doorway. "I only did it in fun, Connie, darling. It was I that wrote to Mr. P—P—Perkins, and sent him your name. And Mr. Perkins needn't act like a hypocrite about it, for, though he didn't write to you, he did to me, and here are two of his silly and disgusting letters, now."

And while one hand of Alice Lennox grasped her damp handkerchief, the other waved two creased and well-worn notes in the air.

"Silly and disgusting! Come now, I say—" burst in Ady Levincourt, and then he suddenly stopped.

"I never wrote to you in my life, Miss Lennox," said Fitz, indignantly.

"How dare you deny it," asked Constance, "when here are the proofs?"

"Oh, dear," said Ady Levincourt, "I shall have to explain. Miss Lennox began the mischief, and I finished it. I wrote those letters to you, Alice—I beg your pardon, Miss Lennox. You see Fitz was so dreadfully high and mighty that I wanted to play off a joke on him."

"Joke, indeed!" said Fitzgerald, thoroughly angry. "You have made me appear like a liar and a hypocrite, and all acquaintance between us ceases from this moment.—Miss Chamberlain, I can't apologize as I ought—"

"Don't attempt it," said Constance, "it was all the fault of our friends, it seems.—Oh, Alice, I never was so mortified and humiliated in my life as I have been by you.—Mr. Perkins, can I have a few words with you, so as to entirely explain matters?"

"Oh, this is dreadful," sobbed Alice, as Constance and Fitz walked away.

"Horrid," said Ady.

"And it has all been my fault," said Alice.

"No, mine," said Ady.

"We—we—we will call it *ours*," said Alice.

"Do," said Ady, tenderly, "and don't cry."

"I can't help it," sobbed Alice.

Thereupon Ady kissed her.

Dead silence ensued, both of them terribly frightened. Then Alice suddenly burst out afresh. Poor Ady, in utter bewilderment, put his arm around her waist, and then lacked presence of mind enough to take it back again. Then Alice, still crying, dropped her head on his shoulder, and then he kissed her again.

Half an hour afterward, as Alice was sitting in her room with tears in her eyes and a smile lingering around the corners of her dear little mouth, a noise was heard at the door, and Constance rushed in and embraced her with a fervor that met with a similar return.

"Oh, Alice," whispered Constance, "I am so happy!"

"So am I, dear," said Alice.

More embracing.

"Do you think, darling," asked Constance, with her head in Alice's lap, "that I am too young to be engaged?"

"No, Connie," said Alice, "for you are older than I am, and—"

But this sentence was never finished, as both these young women felt the necessity at that moment of further embracing.

The class-day of Fitzgerald Perkins and Philip Auchindrane Levincourt was in every way worthy of the class to whom it was sacred. As hosts, these two members of that class would have been entirely successful, had it not been for their marked attentions to two young ladies of great beauty, who were rapturously admired by all the underclassmen present.

Miss Constance Chamberlain was bewildering and beautiful in a singularly intricate mass of rich lace and pale-green silk, while Miss Alice Lennox, in an equally mysterious combination of lavender and cherry, presented a delightful appearance. So tremendous was the impression produced by these young ladies that, at the president's reception in the evening, that wearied official actually took the opportunity to congratulate Mr. Perkins and Mr. Levincourt upon their future prospects, which was, as Ady told Alice afterward, an occurrence without precedent in the history of Harvard.

F. W. LORING.

LORD PALMERSTON IN PARIS IN 1815.

[EXTRACTS FROM HIS PRIVATE JOURNALS.]

PARIS, September 3d.—I went at eight to a review of Prussian troops in the Champ de Mars. There were about twenty thousand infantry, cavalry, and artillery. The Emperor of Russia, King of Prussia, and the Duke of Wellington, were present. Many English, but scarcely any French. The sovereigns rode round, the troops standing in close columns, the cavalry drawn up with their backs to the Invalides. The staff then took post, and the troops marched by.

The Prussians are remarkably fine-looking men, and extremely neat in their dress. The guards are particularly tall and well-sized, so that the whole front rank of each company looks as if it had been sized by a ruler. The cuirassiers are fine troops, the rest of the cavalry are rather slovenly in their appearance, and mounted upon strong but not very active looking horses. The lancers, with their little black-and-white striped flags at the end of their lances, have a very singular and pretty effect at a distance. The foreign troops all march with a shorter and more constrained and stiff step than ours. The Emperor of Russia was so much struck with the active, swinging step of our men, that he ordered his troops immediately to adopt it. In two days afterward he had a body of them out in the Champ de Mars. The men, as might naturally have been expected, were confused and puzzled between the step they were used to and that which they were now required to march with; the consequence was, they did neither one thing nor the other, and marched remarkably ill. The emperor was in a great passion, and put three colonels of regiments into close arrest in one of our guard-rooms. His aides-de-camp thought themselves lucky that he did not order them to dance like Vestris, at twenty-four hours' notice, under pain of a visit to Siberia.

Monday, September 4th.—I went at eight to a sham-fight of the Prussians in the Plain of Grenelle, about two miles out of Paris. There appeared to be about twenty thousand men of all arms. They were drawn up in two bodies, and, after some evolutions of cavalry, one line advanced and the other retired; they did not fire. The manœuvres were said to be meant to represent the late attack of the Prussians upon Paris. The troops manœuvred with great quickness and accuracy, and the Duke of Wellington was much pleased with their manner of deploying from column. I was observing to him the different practice of our army and that of other nations in their manner of advancing to an attack: they always advance in column, we in line. He said he was satisfied that this was one reason why we had always beaten the French; that if troops are steady, and the line is well formed, the line will always have an advantage over the column, from presenting so much larger a front of fire; and that, by attacking the column rapidly, they are prevented from deploying, which is an operation that cannot be performed under a close fire. The object of the column attack is to penetrate into the enemy's position, and deploy in their rear; if it succeeds in this, the result is certain. Twice in the Peninsula the French had established a column on our position, at Busaco and Albuera, but, in each instance they were immediately charged by fresh troops and the column destroyed. At Busaco the duke had had a regiment of Portuguese militia to make a road. The work had, however, been done before they came, and he was going to lead them back. They begged that, as a battle was likely to take place, they might be kept. He consented, and desired them to remain on the very ground where they then were. This happened in the course of the action to become an important point, and the French made a great effort to gain possession of it. The militia soon found that they had made a hard bargain of it, and lost no time in debating who should go away first. The duke, however, immediately brought up two British regiments, and, before the French column could deploy on the ground it had seized, it was cut to pieces. He said he had not above sixteen or eighteen thousand British infantry at Waterloo; that he started with the very worst army that ever was got together; but that four or five regiments who had been in the Peninsula soon gave a tone and character to the whole army, and the result was known. The other troops under his command did very ill. The Nassaus ran away, and fired at him when he rode up to rally them. The Prussian army started with double his force, but, by the time they reached Paris, he was as strong as they were, though he had received no reinforcements, and they had not lost any great number in battle. But their discipline was so relaxed that their numbers rapidly diminished during the march. He had brought sixty thousand to Paris, and they not more than that force. The system of individual plunder had been the ruin of the French army, and would be the destruction of the Prussian. When officers were allowed to make requisitions for their troops, they soon began to make them for themselves; and those who demanded provisions to-day would call for money to-morrow. War then assumed a new character, the profession of arms became a mercenary speculation, and the officer's thoughts grew to be directed to the acquisition of plunder instead of the attainment of glory. The duke had succeeded in keeping his army well in hand. No officer was permitted to make any requisition himself, but was obliged to state his wants to the commissary, who applied to the agents of the French Government for the articles required; and the supply being made through channels known to the people, and by authorities recognized by them, the burden was not felt to be so oppressive as if the exaction had been made by the immediate order of an enemy, and at the caprice of individual officers. The consequence was that, though both the Prussians and ourselves lived equally at the expense of the country, the first are detested and the latter liked.

The Louvre has not as yet been deprived of any pictures of importance, but Lord Clancarty (British ambassador at the Hague) has marked above a hundred which are claimed as the property of the King of the Netherlands; and Canova is arrived from Rome, to claim

both the pictures and statues that belong to the pope. The Venus de Medici is also preparing to return to Italy. The *basso-reliefs* upon the arches and public buildings, in which any thing is contained that relates to Bonaparte, have been chiselled off, and the number of plain entablatures is daily increasing. This is perhaps the best compromise that can be made.

September 19th.—The dispersion of the gallery was begun to-day, and yesterday it was shut for the purpose. The Duke of Wellington, as commander-in-chief of the army of the King of the Netherlands, begins by taking down all the pictures belonging to Holland and the Low Countries; and Austria will take all the pictures and statues that belong to her Italian dominions, and will assist Canova in receiving those which are the property of the pope. The French are extremely indignant at this restitution, and accuse us of a breach of faith, founding themselves upon the articles of the capitulation between Wellington and Blücher on the one hand, and the French army which evacuated Paris on the other. The facts of the case, however, as told me by the duke himself, entirely fail them in making out their case.

When the sovereigns arrived, a negotiation was commenced for a general restitution; but the most powerful parties, England and Russia, being little interested in the question, the matter was not very warmly pressed; and the French Government continued evading the demand in hopes of procrastinating the business till the sovereigns should have left Paris. The Dutch, however, were with much warmth urging their demand, but found some difficulties in their way. In the mean time Canova arrived from Rome to claim the property of the pope; and Charles Long and Hamilton uniting with him in strong and urgent representations, the attention of the allies was drawn to the question. A disinclination, however, was found to exist, and a suspicion that our eagerness arose from interested motives. In order to remove this impression, Lord Castlereagh sent in a note to the Emperor of Austria, to state that, as one objection urged against a general restitution was that some of the parties, and particularly the pope, were too poor to be able to defray the expense of removal, we were willing, in order to prove the sincerity as well as the earnestness of our representations, to engage to pay this expense for the pope, rather than that he should not have his property restored to him. At length the objections of France and the disinclination of Russia were overruled, and a general restitution was resolved upon. The first claimant to be satisfied was the King of the Netherlands, who had indeed an unfulfilled promise from Louis XVIII. of a year's standing. Wellington was sensible that the measure must be unpleasant to the king, and endeavored to carry it into effect in a manner the least likely to hurt his feelings. He said he had never taken more pains about any thing in his life than to make a satisfactory arrangement on this subject. His efforts, however, were fruitless. Talleyrand always evaded answering his propositions, and never would fix upon any day or manner for giving up the pictures. At length the duke's patience was exhausted; and, being called upon by the ambassador of the King of the Netherlands, of whose army he was commander-in-chief, to bring the matter to an issue, he sent word to Talleyrand and Denon that he should, on the following morning, send a party of workmen to take down the pictures, and that the party would, if necessary, be accompanied by a British regiment. This step was taken yesterday, and the gallery shut to the public. This afternoon, however, it has been opened again by the order of Muffling, the Russian commandant; but the workmen who are taking down the pictures are protected by British sentries, posted at every fifty feet along each side of the gallery, and a British detachment mount guard in the square at the entrance of the Musée. This signal proof of the triumph of our arms and of the justice of our principles, in the very palace of the capital, is a remarkable sight. It was well observed by Hamilton, as one reason among many for the general restitution, that it was almost the only gratuitous and unequivocal proof of victory within the reach of the allies. The mere presence of their armies in Paris might be explained away by arrangements and conventions; the cession or deposit of fortified places, or the payment of sums of money by the French, must be the stipulations of a treaty to which the government of France might consent from motives of policy or justice, but in which it acts at all events as an independent power; but, when history shall record that those works of art, which were brought to Paris by victories and held there by the sword, were sent back to their respective proprietors by an allied army in possession of Paris, there will exist no doubt that such a measure would not have been submitted to, unless it had been enforced by arguments more sharp and weighty than the mere principles of reason or of justice.

Friday, 22d.—Went to the review of the British army. The troops were on the ground early, and I got to them about nine o'clock. They were posted in a line parallel to the great road to St.-Denis, with their left on Montmartre and their right on St.-Denis. There were sixty thousand men, including three thousand cavalry and five thousand artillery, all red-coats and subjects of the king, British or Hanoverian. The cavalry consisted only of the Life Guards and Blues, two regiments of heavy dragoons, and one of the hussars of the German Legion. The bulk of our cavalry being stationed in Normandy and Picardy, it was not thought worth while to march them in for this sole purpose. The Emperor of Russia, and King of Prussia, and Emperor of Austria, were all present.

The Duke of Wellington told me afterward that he had not even

looked at the ground; that he had intended to have done so, but never could find time, and had only a sketch of it made by one of his officers, whom he sent to reconnoitre it. The duke had given no orders but to appear upon the ground, and there was not a general of division who knew what was to be done. The first thing the duke did was to change the position of the whole line, advancing it some little distance forward from the ground they had originally taken up. He then gave a sort of representation of his manœuvres at the battle of Salamanca. He supposed his object to be to gain possession of some heights in front of Montmartre, or rather the brow of the hill itself. He detached part of two divisions from the right toward St.-Denis to go round and take the supposed enemy in flank, while he himself attacked them in front. He marched the army about a couple of miles across the country, describing a sort of quarter-circle round Montmartre; and the manner in which the columns of infantry advanced, with occasional charges of cavalry and of bayonet, gave one a perfect representation of the attack of an army in an engagement, with the exception that there was no firing. At last, when those who did not understand his evolutions the least expected it, he suddenly deployed the whole into two lines in the most beautiful order imaginable. There was then a general salute. The sovereigns having taken part, on the spot where they happened to be, the whole army marched by, in about an hour and a half. Nothing could exceed the steadiness, and precision, and rapidity, with which the manœuvres were performed. There was no confusion at any point. The men got over the ground at a surprising pace; and, when the deployment was made at last, the lines were as correct as they could have been when on parade. The foreigners who had been to the Prussian review, where the whole thing had been diligently rehearsed for two days beforehand, and where the plain was covered with little posts with bunches of straw on the top of them, to point out to each division the ground it was to occupy, were surprised and astonished to find that no such preparations had been made on our part, and that Wellington set out to move about an army of sixty thousand men with as much ease as he would have done to move a set of chessmen upon a board. It was some time before they would believe that no orders had been given or plan formed; and Prince Maurice Lichtenstein did not seem to credit it till he had been assured of the fact by almost all our generals of division, whom he successively asked. They were also much struck by seeing the Blues and Life Guards charge over two very deep and wide ditches that ran on each side of a road which they were ordered to cross, and which they effected with very little loss, having only three or four tumbles. That which our men did least well was marching by. The army was very much admired for its steadiness, its lightness, and regularity, and the care with which it was manœuvred. The Highlanders and the horse-artillery seemed particularly to excite attention; and, though the proceedings at the gallery had put us out of favor with the Parisians, still there were a considerable number of French spectators, and many carriages full of ladies, a thing never seen at any of the Prussian reviews.

Thursday, 26th.—Dined at Verey's with Bruce L. Nervins Ment Breton, a man who had been chief of the police under Bonaparte for three years. He looks like a thief as much as a thief-taker, and has the most remarkable side-look out of the corner of the eye I ever saw. He told us some amusing anecdotes of the Bonaparte family. He said that Napoleon was very much swayed and influenced by them, and particularly by his sisters, who were clever and ambitious women, and who often made him change determinations which he had formed with apparent obstinacy. He said the brothers were most of them weak and foolish, and had all of them the inconceivable folly to imagine that when they were sent to be sovereigns of conquered states, they were really meant to be independent kings, and that it was often difficult to convince them of their mistake. He was at Cassel when Jerome came to take possession of the kingdom of Westphalia, and he said the little man strutted about and gave orders to the right and left just as if he was fixed there for all eternity; and, when Nervins hinted to him something about the emperor, he replied, with admirable dignity, "Sachez que je suis empereur chez moi." Nervins, however, whose particular business it was to keep him in order, suggested that perhaps the emperor might send a general of division to take possession of his kingdom if he gave himself too many airs; and Jerome appears at length to have been accessible to the force of such persuasive reasoning. One day at a *levée* a courier arrived with dispatches from Bonaparte. Nervins, who had sent complaints of Jerome, and entreated Bonaparte to give him a lecture, was curious to see how it would be taken, and maliciously pressed the little king to let them know what the emperor said. Jerome opened the letter, and, with the utmost coolness and self-possession, read it aloud to the ministers and persons present; and, as he read it, it ran that Bonaparte was delighted to hear how well he went on; that his administration was so prudent and popular, his finances so flourishing, and his army so well established, that he every day saw fresh reason to approve the choice he had made of him for that kingdom, and ended by assuring him of his undiminished affection and regard. Nervins smiled at the manœuvre, and, having observed that a tall officer of hussars had taken advantage of his superiority of stature to crane over little Jerome's shoulders while he was reading the letter, he asked him as they went out what he thought of the letter.

"Think of it?" replied the officer. "I never was so thunder-

struck in my life. Why, would you believe it, I read the letter over the king's shoulder, and it was word for word the direct contrary of what he read in so unhesitating a manner to us!"

Thursday, 28th; Friday, 29th.—Usual Paris life; going to the gallery, or the buhl-shops, or the sights in the morning; taking an early dinner, and visiting some one of the theatres and Lady Castlereagh's in the evening. On the evening of Friday we were much amused by the hereditary Prince of Bavaria, a very well-disposed man, but of very singular manners and appearance. He has some defect in his palate, and a considerable deficiency in his intellects, so that, what with the original absurdity of his ideas, and the inarticulate manner in which he gives vent to them, it is difficult to preserve a decorous gravity when conversing with him, especially as he is very fond of talking English, which he speaks extremely ill. Lady Castlereagh told me that he came up to her one day in the gardens at Versailles, and said, "Madame, you Lord Cassel's wife?" She assented, upon which he exclaimed, with a tender and engaging look, "Dahm de French!" His fondness for the English and his detestation of the French seem the only interesting parts of his character.

Saturday, 30th.—To-day the Austrians made their long-talked-of attack upon the brass horses attached to the gilt car on the top of the triumphal arch in the Place de Carrousel. As, however, they had no workmen or tools with them, they were obliged to apply to us, and we lent them a detachment of our staff corps under Captain Todd. Parties of Austrian cavalry guarded the approaches to the square, and in the inside of it a battalion of Hungarian grenadiers were drawn up.

It had been intended to take the horses down in the night, by way of avoiding an apparent insult upon the king, as the arch is so close to the windows of the Tuileries; but it was found impossible to take them down with safety in the dark, and it was also thought that any disturbance that might arise would be less easily dealt with at night than by daylight. There had been some little symptom of a disposition to resistance on the part of the mob, and a brigade of British troops were under arms at the entrance of the Champs Elysées, ready to march in at a moment's notice. The display of force, however, prevented the necessity of using it, and no interruption was offered to the workmen; indeed, no persons on foot, except English or allies, were allowed to enter the square, so that the mob was kept aloof. A triangle was hoisted up and fixed upon the top of the arch, the horses were slung by a pulley fastened to it, and, the cement which held their feet having been cut away, they were hoisted up and then lowered just in the same manner, and with as much care, as live horses are embarked on board a ship from a pier in a harbor. The erection of the triangle, however, having taken a considerable length of time, only two of the horses were got down before sunset, and the remaining two were left to be got down to-morrow morning. The operation was performed with the greatest success; they were lowered into wagons loaded with straw, and placed under the arch to receive them, and then drawn away under an escort of Austrians to the place where they were to be properly packed. I ascended the small staircase which leads to the top of the arch to see them before they were taken down, and was much struck with the exquisite beauty of the workmanship, which, of course, was lost to the eye when one looked at them from below. Their age and master are not well known, but it is generally believed they were made by Lysippus, a contemporary of Alexander. They were originally at Corinth; from there they were carried to Rome; when the seat of empire was moved they followed the emperor to Constantinople, where they were placed in the Hippodrome. There they remained from the days of Constantine till the Venetians entered Constantinople. They were then transported to Venice, and in the further lapse of ages the victories of Bonaparte brought them to Paris, to remain there, as he said of the Apollo, *forever*. They are now returning to Venice, and are at least likely to continue there as long as they have done at Paris. The triumphal car to which they were attached was soon stripped of the gilt-lead ornaments and wreaths with which it was decorated. I was lucky enough to get to the top of the arch before the plunder was completed, but I was told that pieces of the spoil sold in the course of the afternoon for a Napoleon apiece. A magnificent spread-eagle, which was stuck to the front of the car, was claimed by the staff corps for the sideboard of the mess-room.

Sunday, October 1st.—The remaining two horses were taken down early this morning, and the car and angelic grooms left looking most forlorn. I met in the evening, at Lady Castlereagh's, a dark-looking man, whom I imagined to be Alava, the Spanish minister, and a great friend of Wellington's. We were talking of the descent of the horses; he said it had enraged the French, and regretted the manner in which it had been done. I asked in what other possible way it could have been effected. He said the King of France ought to have had another lot of horses made as like them as possible, but of lead. He should then have taken down these in the night, and have put up the others, and by that means all parties would have been satisfied; the Venetians would have had their own, and the French would not have found out their loss. I stared, and said to myself, "Who you are I know not, but I am sure you are not Alava." I found out he was the Sicilian minister.

CHARLES DICKENS.

BY W. C. FROST, TRINITY COLLEGE, DUBLIN.

O H Soul of Sympathy! if, for one hour,
Might rest on me that high and subtle power
Which gave thee strength for those that were all-weak,
And eloquence for those who could not speak,
Not then, methinks, my willing verse should seem
Unworthy ever of its glorious theme!
Yet let me think of thee as I have grown
To love thee through the page where thou hast shown
Thy very self eternally enwrit;
The charitable heart, the kindly wit.

Thy freshening thoughts, which spring as myriad flowers
From a rich soil, enclustering the bowers
Wherein thou ledest us to pure retreats,
While all the air around is filled with sweets—
A quickening atmosphere of buoyant health
A mirthful essence, wakening as by stealth
Unconscious merriment—such is the store
Which thou hast left posterity; yea, more
Than this is ours, for this were passing joy;
And thou hast given wealth without alloy.
Of thee shall not be said, as of the sage
Who hath bequeathed a dark mysterious page
To teach the world—"He read the distant spheres;
Drew wisdom from the skies, and taught the years
To run their courses in unerring line."
A simpler, truer eulogy is thine!
Of thee we speak: "He did not seek to trace
The laws of suns and stars, but marked the grace
Of Nature's flowers, growing at his feet,
And loved their modest fragrance softly sweet;
Or wept, beholding beauty, once so fair,
Foul in the dust, or faint in poisoned air."
For thou hast taught us mysteries of life;
Hast shown us hungry Misery at strife
With idle Ease. Through thee, the dull'd eye,
Whose lustrous sparkle of light infancy
Is quenched by early tears, looks on our own;
With eloquence more strong than Sorrow's moan
Praying our love. Gaunt figures wan and pale;
Slow-suffering Silence; haggard looks that quail
And shrink from life—these find a voice in thee,
And ask a crumb of passing charity
From a cold world. Anon, as if o'erweighed
By sadness at the picture thou hast made,
Thou bring'st an Angel-presence to our sight;
A gladdening Angel, shedding heavenly light
With incense of pure kindness; healing grief,
And ministering gifts of sweet relief.
Delightful Dreamer! at thy potent spell,
Home-palaces, where regal natures dwell
Unlit by fame—shine radiant with the glory
Thy genius throws around in magic story!
We fain would follow thy enchanting light
And breathe the delicious humor, till our sight
May better read the truths thou wouldst impart,
And learn the noble greatness of thy heart!

And art thou loved for sympathy with sorrow?
Sure never could there come so dark a morrow
When thy unceasing mirth might not prevail
To glad our fancy with the sparkling tale
Of overflowing drollery—keen wit—
Circling as air the thousand thoughts that flit
Mid incident and scene. Creation true
Of master-spirit, portly Pickwick grew;
A very friend of all; a nation's own;
An English heart, whom English brain alone
Could shape "immortal:" while a humorous train
Bear company, and in a charmed domain
Of merriment, make groupings picturesque;
And shift the changeful scenery grotesque
To ever-fresh conceits. Or now, behold
A new assemblage, strange and manifold,
And mocking life itself: the brutal Sikes;
Poor fallen Nance, bred where hunger strikes,
Goading to crime. Behold the crafty Jew,
His miserable train and cunning crew;
The unctuous Beadle, and the Outcast Boy;
The Man Benevolent, bestowing joy
On hopeless hearts; the Scoundrel, Beggar, Thief;
Offsprings of want, begot in sin and grief,
Cursing the world. Or see, where shadows fall!

FLORENCE bereft of mother; dreamy PAUL,
The child of fancies, snatched by eager death :
Or withered SKEWTON, in her latest breath
Worshipping earth. The smoothed-faced Hypocrite
And canting Knave, reflected every whit
In PECKSNIFF stands. A miser NICKLEBY,
Gold-grasping, lost to love and charity ;
Lost to the home-love of a gentle KATE ;
Panting for wealth, yet storing naught but hate ;
Points a high-road to misery and woe,
Where sin-empoisoned spirits come and go.
And ever throng the multitude of forms !
Bright-gleaming faces ; faces beat with storms ;
Faces of love-light ; faces stained with tears ;
The child's sweet face ; the face of bitter years.
Humanity, in wrinkled quaintness sprung,
Scarce like Humanity in form and tongue,
But human still at heart—a curious race,
Mixed with our common life in every place—
Sought by thy yearnings, cherished by thy love,
Comes forth to speak with us, as fain to prove
Ourselves their brethren, thee their brother-friend
And champion-love, till human love shall end.

The full-fed Ignorance, which claimed to teach
And nurture youth—which fattened out of reach
As out of sight of Justice—shaped in SQUEERS—
Stands forth the hideous monument of tears
And early woes : stands forth the hateful nurse
Of supple minds—the foul and greedy curse
Of tender hearts—whose slothfulness, by thee
Deep-stung, hath hid its base deformity :
Like monster bred of darkness, whose dull eyes
Shrink from the morning broke from eastern skies.
For this how shall we thank thee ? Nay, thou'rt blest !
And thanks were naught, since thou art laid to rest.
Yea, though thou heard'st us from thy high-set place,
And we might look upon thine angel-face,
And know thou hearest—thou hast thy reward !
And acts of charity shall best record
The thanks and love we owe. If but Love's strength
Shall bind our social wounds, until at length
True sympathy—the well-spring of our deeds—
Shall gently heal the smitten heart that bleeds,
Thus shall we weave for thee a crown of flowers,
Made of the blossomed days and budding hours.

Let not our English friends, beyond the sea,
Refuse the satire's lash which fell from thee ;
Nor hate a CHUZZLEWIT, whose open mind
Rebuked with candor, or with wit refined.
But if they scorn, yet they at least may dwell
On the fresh beauty of a LITTLE NELL,
Or LITTLE DORRIT : or, in meek TOM FINCH,
May read simplicity. Thou couldst not flinch
From all Columbia's hate. The cloud hath past.
The sunset of thy day was overcast
By no dark cloud. Thy glory is but young ;
Though, in thy life, fame's dawn hath brightly sprung.

Improvident Absurdity, appear !
MICAWBER, with thy condescending leer
And sounding words ; and bid us laugh again
Thou pompous ass ! Bring back the bright-linked chain
Of cherished faces ! DORA ; good AUNT TROT ;
Bid DAVID tell again the checkered plot
Of his own story. PEGGOTTY and HAM ;
STEERFORTH and BARKIS ; and thou bare-faced Sham,
Base-fawning HEEP—appear ! we know you all :
Your forms, as household shadows on the wall,
Oft flit before us, like the loving thought
Wherewith our household memories are wrought.
DAVID, we bless thee ! whatsoe'er thou be :
Whether a sprite that hath reality
Enclosed within thy shape—a DICKENS' self—
Or whether, yet, no more than fabled elf
With human sympathies, thou dost instil
Gay mirth or tender sorrow at thy will—
Yet ever, Bless thee ! since in thee we find
DICKENS, most truly DICKENS, heart and mind.

Upon the mirth of nations there hath come
A pause of sadness, for that he is dumb
Who could alone pour forth a flood of joy
Upon the people ; he who could destroy
The narrow prejudice of chilling pride
With warmth of happy humor, and o'erride,
In multitudinous fancy, scornful hate ;

With power more simple than of high debate,
Or well-trimmed sentiment. His light of mirth
Shone as a sunbeam on the thankful earth :
Into the foulest dens it brightly fell,
Where shapes of wasting sorrow darkly dwell ;
Smiting the blindness of the wearied eyes
With healing strength of hope, and glad surprise :
Still purely shining. To the boy at school,
Crushed 'neath the rigor of a tyrant's rule,
It came the harbinger of clearer day,
When shadows, born of ignorance, give way
To dawn of sober truth. We wept, we smiled ;
A thousand times we laughed ; we were beguiled
Out of our very selves ; we dwelt in air,
And far below us left each pining care ;
When BOOTS appeared ; when WELLER cracked the joke ;
Or CAPTAIN CUTTLE, moralizing, spoke.
Since DOGBERRY and FALSTAFF, PETER QUINCE
And BOTTOM were our friends ; yea, even since
Bold CRUSO held us charmed—no power could reach
Our hearts like DICKENS : never sage could teach
Like him who gave us gladness without measure ;
Great precepts hid in sweetness and pure pleasure.

Nor men alone he drew. The city-street ;
The alley and the lane, where busy feet
Pass to unnumbered ways ; the country-town ;
The shady forest-glade ; the breezy down ;
Quaint by-ways, ancient nooks, and antique places,
He made familiar as the well-loved faces
That haunted them. With IRVING's own delight
He pencilled beauty, where our duller sight
Saw naught but shapes uncouth. For IRVING's heart
Seemed of his own the earlier counterpart.
With brighter light his gleams of satire burn
Than shines in BALZAC, or erratic STERNE :
More chaste than SMOLLETT, or voluptuous FIELDING
His armored wit with true compassion wielding.

What man is he, unthinking and unkind,
Who murmuring complains, " We cannot find
Thy teaching like to His who taught us Love
With heavenly Truths ? " Say, whence but from above
Might such broad-beaming charity descend ?
(Albeit the earthly teacher did unbend
To earthly fancies)—whence that burning light
Which scorches rank hypocrisy, where night
Would cloak the sin ? Oh, let the dumb mouth speak,
And plead an answer ! Let the pallid cheek
Flush crimson at the mention of his name !
And let the brilliant lustre of his fame
Grow fainter day by day, if not of Heaven
Such great and pure imaginings be given !

What was he then himself ? What were his deeds ?
What was his life ? And which of all the creeds
Held he in death ? The wider creed which grows,
Embracing all humanity—which knows
Each common hope, each common tender love ;
The Charity which cometh from above—
This was his creed in life ; his creed in death ;
The blessed creed which drew his latest breath.

SAVANNAH.

THE city of Savannah, the commercial emporium of Georgia, is situated on the south bank of the Savannah River, about seventeen miles from its confluence with the sea. The site was selected by General Oglethorpe, the founder of the colony of Georgia, who made his first settlement at this point in February, 1733. The city occupies a promontory of land, rising in a bold bluff, about forty feet in height, close to the river, extending along its south bank for about a mile, and backward, widening as it recedes, about six miles. The river making a gentle curve around Hutchinson's Island ; the water front of the city is in the form of an elongated crescent, about two and a half miles in length. The present corporate limits extend back on the elevated plateau, with lowlands on its eastern and western flanks, a distance of about one and a half miles ; the area of the municipal limits, at present almost entirely occupied with buildings, being three and one-third miles square. Beyond the city limits, to the south, suburban settlements are fast growing up ; and, at the present ratio of expansion, the city proper will soon comprise double its pres-

MOUTH OF THE SAVANNAH RIVER.

VIEW OF SAVANNAH FROM THE RIVER.

ent area, the adjacent grounds being both eligible and available to an unlimited extent.

In its general plan, Savannah is universally conceded to be one of the handsomest of the American cities; and in view of its antiquity, and the fact that its founders were for the most part poor refugees, seeking a home in the wilderness among hostile savages, it is a matter of surprise that they should have adopted a system at once so unique,

These plazas—twenty-four in number, located at equal distances through the city, handsomely enclosed, laid out in walks, and planted with the evergreen and ornamental trees of the South—are among the distinguishing features of Savannah, and in the spring and summer months, when they are carpeted with grass, and the trees and shrubbery are in full flower and foliage, afford delightful, shady walks and play-grounds for the juveniles, while they are not only ornamental, but

BONAVENTURE CEMETERY, SAVANNAH.

practical, and tasteful. The streets—running nearly east and west, and north and south, and crossing at right angles—are of various widths; the very wide streets, which run east and west, being alternated with parallel narrower streets, and each block intersected with lanes twenty-two and a half feet in width. The streets running north and south are of nearly uniform width, every alternate street passing on either side of small public squares, or plazas, varying from one and a half to three acres in extent, which are bounded on the north and south by the narrower streets, and intersected in the centre also by a wide street.

conducive to the general health by the free ventilation which they afford. They have well been called the lungs of the city.

Upon the large "trust-lots," four of which front on each of these squares—two on the east and two on the west—many of the public edifices and palatial private residences of Savannah are built. It is a little singular that the Savannaheans are indebted for this beautiful and unique feature of their city to the sagacious precaution of the first settlers against the dreaded attacks of the Indians.*

* We are told by Mr. Francis Moore, who wrote in 1736, that "the use of this is, in case a war should happen, the villages without may have places in

In addition to these old camping-grounds—many of which were occupied for the same purpose by General Sherman's troops, during his occupation of the city—a public park, comprising some ten acres (since increased to thirty acres), called Forsyth Place, was, a few years since, laid out, a considerable distance south of the city limits. It is, however, now being rapidly enclosed by buildings, and will in a short term be the centre of one of the finest and most populous portions of the city. Many of the original pine-trees were left standing on the grounds, which are laid out in serpentine walks, and ornamented with evergreen and flowering trees and shrubbery. In the centre is a handsome fountain, after the model of that in the Place de Concorde in Paris, and which is supplied with water from the city water-works. The lofty pines still standing, with the ornamental trees, afford a grateful shade; while the beautiful shelled walks, the luxuriant grass, the fragrant flowers, and the plashing fountain, make Forsyth Place a delightful retreat from the noise, bustle, dust, and heat of the city.

Among the peculiar features of Savannah which command the admiration of strangers are the wideness of its principal streets, abounding with shade-trees, and the flower-gardens which, in the portions of the city allotted to private residences, are attached to almost every house.

Ornamental trees of various species, mostly evergreens, occupy the public squares, and stud the sidewalks in all the principal thoroughfares; while the gardens abound with ornamental shrubbery and flowers of every variety. Conspicuous among the former are the orange-tree, with its fragrant blossoms and golden fruit in their season, the banana, which also bears its fruit, the magnolia, the bay, the cape-myrtle, the stately palmetto, the olive, the *arbor vite*, the flowering oleander, and the pomegranate. Flowers are cultivated in the open air, many choice varieties—queen among them all, the beautiful *camellia Japonica*, which flourishes here in greatest perfection, the shrub growing to a height of twelve to fifteen feet—blooming in mid-winter. At all seasons, Savannah is literally embowered in shrubbery, and in the early spring months, when the annuals resume their foliage, and the evergreens shed their darker winter dress for the delicate green of the new growth, the aspect of the city is truly novel and beautiful, justly entitling it to the appropriate *sobriquet* by which it has long been known, far and wide, of the "Forest City."

The old city of Oglethorpe's time was located on the brow of the bluff, about midway between the present eastern and western suburbs, and its boundaries are still defined by the Bay, and East, West, and South Broad Streets. Upon the river-front, a wide esplanade, about two hundred feet in width, extending back from the brink of the bluff, was preserved for public purposes. This is called the Bay, and is now the great commercial mart of Savannah. As commerce grew up, warehouses and shipping-offices were built by the first settlers, under the bluff between it and the river. In time these were replaced by substantial brick and stone structures, rising four and five stories high on the river-front, with one or two stories on the front facing the Bay, connecting with the top of the bluff by wooden platforms, which spanned the narrow road-way beneath, passing between the buildings and the hill-side. Some of these buildings, spared by the great fire of 1820, which consumed the larger portion of the old town, are interesting for their antique and quaint architecture. A range of them, opposite the foot of Bull Street—the fashionable thoroughfare of the city—is made the subject of a sketch by our artist. These relics of old Savannah, and a few others, hold their place in the line of stately modern buildings, which now extend along the larger portion of the city front under the bluff. Platforms still connect the upper stories of the stores under the bluff with the Bay; and at the foot of the principal cross-streets walled road-ways lead to the quay, which is wide, and occupied at intervals with large sheds for the protection of goods in the process of shipping and discharging. Along the quay, in close proximity to the wharves, are also located the cotton-presses and rice-mills.

While Savannah makes no special pretensions to architectural beauty, nevertheless the city contains many fine public and private buildings, and the good taste which characterizes her modern improvements evinces a progressive spirit and liberality worthy of her rapidly-increasing wealth and commercial importance. Some of her church edifices are models of architectural beauty; and among the

town to bring their cattle and families into for refuge, and for that purpose there is a square left in every ward, big enough for the outwards to encamp in."

new buildings, many of which have been erected within the past two years, are some substantial and imposing structures. Conspicuous among these is the stately pile, six stories high, crowned with a Mansard roof, which occupies the centre of the accompanying pictorial sketch, recently erected by Mr. Eugene Kelly, a Northern gentleman, who, since the war, has invested largely in real estate in Savannah. The spirit of improvement which has received such an impetus within the past two years is fully shared by the municipal government, which, having recently completed the new police-barracks, is now erecting a new market, that, when completed, will challenge comparison with any similar structure in the country.

The present population of Savannah is about thirty thousand souls, of whom five-eighths are white, and three-eighths black and colored; the increase of population since the census of 1860 being some seven thousand. The present assessed total value of the real estate of the city is \$15,341,900, showing also a very considerable augmentation of wealth during the same period.

If, under all the embarrassing circumstances of the past ten years, Savannah has advanced in population and wealth, her commerce has increased in a still greater ratio, as will be shown by a comparison of the exports, foreign and coastwise, in 1860, with those of 1870. The total exports in 1860, the year preceding the war, consisting of cotton, rice, and lumber, were \$17,798,922. The exports for the year 1870, as ascertained from the official records of the custom-house, amounted to \$58,000,000, with a tonnage in port, during the year, of 1,129,884 tons, employing 22,101 seamen. This great increase in the commerce of Savannah is mainly owing to the extension of her railroad connections. Recently, direct rail communication with the Mississippi River at Vicksburg has been opened, and already its advantage to the commerce of the city is being realized. The receipts of cotton, from September, the close of the commercial year, are already in excess of the entire receipts of last year, and will, it is estimated, reach at least 700,000 bales the current year, with a corresponding export in value of at least \$70,000,000.

These facts afford a striking illustration of the growing importance of Savannah as a commercial centre of the South—the natural result of the completion of a railroad system which her enterprise projected, and which the capital and energy of her citizens mainly built. Until the construction of the Central Railroad, some thirty years since, Savannah was comparatively isolated from the internal commercial world, her only communication with the interior of the State being by the Savannah River to Augusta, the head of steamboat-navigation—the wilderness and the great swamps of the Altamaha interposing an impassable barrier to the vast and fertile regions of the Southwest. By her great trunk-roads—the Central, and the Atlantic and Gulf, and their connections—she now offers an outlet for the products of the entire State of Georgia, Middle and West Florida, and portions of Alabama and Tennessee, and is in unbroken railroad connection with Memphis, Mobile, Vicksburg, Louisville, Cincinnati, and the principal commercial centres of the West. When it is considered that this system of railroad communication, which has already accomplished so much, is constantly radiating and extending; that the harbor is one of the best, safest, and most accessible on the South-Atlantic coast, and that it is almost on an air-line by the shortest route with San Diego on the Pacific, the impulse which must be given to the commerce of Savannah by the completion of the South-Pacific Railroad cannot be over-estimated.

The benevolent, literary, and educational institutions of Savannah are numerous and liberally sustained, some of them being among the oldest in the country; the Union Society, for the support and education of orphan boys, and the Female Asylum, for the care and education of orphan girls, having been founded in 1750. The St. Andrew's Society, St. George's Society, Hibernian Society, Irish Union Society, Hebrew Benevolent Society, Ladies' German Benevolent Society, the Abram's Home for Poor Widows, the Home for Old and Indigent Colored People, the Savannah Poor-House and Hospital, and the Marine Hospital, are all highly-respectable, prosperous, and beneficent institutions. There are also the Georgia Historical Society, the Georgia Medical Society, Young Men's Library Society, and Young Men's Christian Association, besides other fraternal and social associations.

The subject of popular education has commanded the attention of the best and most influential citizens of Savannah, through whose exertions, sustained by the liberal provision of the municipal government, a public-school system has been inaugurated, which is justly

pronounced equal to that of any city in the Union. The Rev. Barnas Sears, D. D., Agent of the Peabody Fund, while on a recent visit to Savannah, after investigation, in a public address, highly complimented the Board of Education on their admirable school system. At the public schools, which are classified, progressing from the primary to the grammar and high schools, two thousand children are in regular attendance.

The people of Savannah are justly proud of their well-disciplined and efficient uniformed police, all white, and of her thoroughly-organized and effective fire department, which comprises four first-class steamers, with several hand-engine hose, hook and ladder companies.

Owing to the crescent form of the city front, its elevation, and the absence of any eligible point of observation on the opposite side of the river, it is difficult to obtain a view that will convey a correct impression of its size and appearance. This difficulty our artist experienced, as the best position which he could obtain, on Fig Island, presented but a meagre profile of the city front and its eastern environs. He has, however, given us a sketch of the city as seen from that point, that will be readily recognized. The view takes in the line of Hutchinson's Island, on the opposite side of the river, which extends the entire length of the city. The average width of the river, between the city, and the island, is about seven hundred and twenty feet, with a depth of water, at the wharves, averaging from thirteen to twenty-one feet. The island, which is two miles in length, and one mile in width, was formerly extensively cultivated in rice; but, with all the other low lands in the immediate vicinity of the city, is now restricted by sanitary laws to dry culture. Lumber-mills are located in it, and a large dry-dock is being constructed on that side of the river.

The accompanying view of the mouth of the Savannah River conveys a very correct idea of the appearance of the entrance to the harbor, which is capacious and well protected, Tybee Island being the head-land on the right, and the extreme southern point of another island defining the entrance to the river on the left. The steamer seen nearly opposite Fort Pulaski, which is situated on Cockspur Island, has passed the bar, upon which there is a depth of twenty-six feet of water, and, following the wide channel marked by the buoys, is proceeding on her way to the city, which may be reached at full tide, with a depth of eighteen and a half feet of water. When the dredging is completed in what is called "The Wrecks," an obstruction which has existed in the river opposite the eastern end of Fig Island since the old Revolutionary War, a much greater depth of water can be carried up to the city. Passing up the river, the stranger is struck with the peculiar aspect of the wide expanse of grass-clad salt-marsh through which it meanders, forming many islands, but preserving at all times ample width for the navigation of vessels of the largest class. About four

miles from the city, at the opening of St. Augustine Creek, the Confederate earth-forts and the remains of the obstructions are passed, and, a little farther on, Fort Jackson, from which point the city is in full view.

Since the war the tonnage visiting the port of Savannah has largely increased, and in the business season the present wharfage is hardly sufficient to accommodate the shipping, a fact which has rendered an extension of the wharves necessary. The present steam marine comprises seven lines of ocean steamships; four lines to New York, one to Boston, one to Philadelphia, and one to Baltimore, besides lines of steamboats to Charleston, Augusta, Darien, Brunswick, Jacksonville, Pilatka, and other Florida ports.

Being in latitude thirty-three degrees and some minutes, and so near the Gulf-Stream as to be within the influence of its atmospheric current, the temperature of Savannah has all the mildness of the tropics in winter, without the intense heat in summer, the mean temperature being 66°, very nearly the same as that of Bermuda. The sultriness of the "heated term" in Savannah is less oppressive than in New York or Boston, mitigated as it is by a soft, humid atmosphere, and the never-failing breath of the "trade-winds," so grateful at that season. In point of health, the mortality statistics of Savannah will compare favorably with those of any other city of the same population in the United States,* the locality being comparatively free from the fevers of the lower latitudes, and almost entirely exempt from the pulmonary affections so prevalent farther North. For Northern invalids the climate of Savannah, with the conveniences and comforts of the metropolis, is considered preferable to that of the sanitary retreats on the coast farther South.

Savannah is not without suburban attractions, there being several places in its vicinity of historical interest, whose sylvan character and picturesque beauty are in keeping with the "Forest City" itself. Thunderbolt, White Bluff, Isle of Hope, and Vernon, are all rural retreats on "the salts," within short drives of the city, where, in the summer months, the bracing sea-breeze and salt-water bathing are enjoyed. At each of these places, which are reached in a few minutes by an extension of the city railroad, are small settlements and good accommodations for visitors. Bethesda, about ten miles from the city, where the Union Farm School is located, was the site of the Orphan House established by Whitefield in 1740.

Our artist presents a sketch of Bonaventure, which is located on Warsaw River, a branch of the Savannah, about four miles from the city. The scenery of Bonaventure has long been renowned for its Arcadian beauty. A hundred years ago, the seat of a wealthy English

gentleman, the grounds around the mansion, of which only a dim outline of its foundations remain, were laid out in wide avenues, and

* The ratio percentage of deaths last year, based upon a permanent population of 15,938 whites and 13,217 blacks, was, of whites, 2.91, and of blacks,

STREET SCENE IN SAVANNAH.

planked with native live-oaks. These trees, long since fully grown, stand like massive columns on either side, while their far-reaching branches interlacing overhead like the frilled roof of some vast cathedral, the deep shade of their evergreen foliage shutting out the sky above, and the long gray moss-drapery depending from the leafy canopy, silent and still, or gently moving in the breeze, give to the scene a weird and strangely-sombre aspect at once picturesque and grandly solemn. Many years ago Bonaventure was devoted to the purpose for which it is so peculiarly fitted by Nature, and became the burial-place of many of the prominent families of Savannah, whose memorial monuments add to its solemn beauty. Recently the place has been purchased by a company, by whom it has been enclosed, the trees trimmed, the grounds cleared of their rank growth, laid out in lots, and opened to the public as a cemetery. In this operation much of the wild beauty of Bonaventure has been literally trimmed away, thus demonstrating the fact that, in the picturesque at least, it is not always in the power of art to improve upon Nature.

Though constantly threatened from the commencement of the war till its evacuation at its close, Savannah was so fortunate as to escape attack. Since the war her citizens have been equally fortunate in being able to preserve her municipal government in the hands of her own people. A wise and prudent administration of her affairs, together with the business enterprise and energy of her citizens in re-opening and extending the old channels of commerce, and in inviting and providing employment to capital and enterprise from abroad, has given an extraordinary impetus to the growth and commercial prosperity of the city, which, with the great natural advantages of her position and the accomplishment of the great enterprises of internal improvement with which her interests are identified, afford the most encouraging assurance of a prosperous future.

W. V. THOMPSON.

THE FIRST MAYOR OF NEW YORK.

IN an old burying-ground, at the head of a smooth sheet of water known as Bullock's Cove, in what is now Seekonk, Massachusetts, may be seen a rough stone, on which is rudely carved the following inscription:

MDCLXXXIV.

Here lyeth the body of the worthy

THOMAS WILLET, Esq.,

Who died August ye 4th, in ye lxiivth

Year of his age, Anno —,

Who was the first Mayor of New York,

And twice did sustain the place.

THOMAS WILLET, the successor of Miles Standish in the captaincy of the Plymouth-Colony militia, the founder of Old Swansea, and the first English Mayor of New York, was born in England, in 1611. He was bred a merchant, and he became acquainted with the Pilgrims at Leyden, when a mere lad, while travelling on business in Holland. He was a resolute youth, large-hearted and adventurous, and, the lofty aims of the Pilgrims having engaged his sympathies, he embarked for Plymouth in 1629, being one of the last of the Leyden company who sought a place of religious freedom in the rugged solitudes of the Western World. He was then about eighteen years of age, his mind well schooled in the duties and responsibilities of mercantile life, and polished by travel and by intercourse with the most cultivated people; his aspirations high, and his trust in God firm and pure. Soon after his arrival he was sent by the people of Plymouth to establish a trading-house at Kennebec, and to superintend their business at that place as agent. He remained there about seven years, and, though a mere youth, he bravely endured the hardships of the winter-bound forests, and fulfilled his duties with singular prudence and success.

The following anecdote, as related by Mr. Winthrop, affords a pleasant picture of the young merchant at this period of his adventurous career: "At Kennebec, the Indians wanting food, and, there being store in the Plymouth trading-house, they conspired to kill the

English there for their provision; and, some Indians coming into the house, Mr. Willet, the master of the house, being reading the Bible, his countenance was more solemn than at other times, so as he did not look cheerfully upon them as he was wont to do; whereupon they went out and told their fellows that their purpose was discovered. They asked them how it could be. The others told them that they knew it by Mr. Willet's countenance, and that he had discovered it by a book he was reading. Whereupon they gave over their design."

In 1647 he succeeded Miles Standish in the command of the military of Plymouth Colony. This office was no sinecure, but one involving stern duties and grave responsibilities, and he brought to it the essential requisite of mature judgment, an unbending will, and a stout heart.

In 1651 he was elected one of the Governor's assistants in the Court at Plymouth, to which office he was annually reelected for fourteen years.

In the winter of 1660 Captain Willet was an inhabitant of Rehoboth, Massachusetts, having obtained permission to purchase large tracts of land in that section of country. Soon after his coming to Rehoboth, he received the consent of the Court at Plymouth to purchase a tract of land of Womsitta, or Alexander, the eldest son of the friendly Sachem Massasoit, which was then called the Rehoboth North Purchase, but which is now known as Attleborough, Massachusetts, and Cumberland, Rhode Island. He was also the original proprietor of a large tract of land known as the Taunton North Purchase, where now flourish the towns of Norton, Mansfield, and Easton, Massachusetts, names familiar to the traveller.

In 1664, Charles II. of England, unwilling that any but English settlers should maintain an independent government in the midst of his growing colonies, made a grant of all the territory claimed by the Dutch at Manhattan and on the North River to his brother, the Duke of York and Albany. Colonel Richard Nicholls was commissioned to take possession of these Dutch colonies, and to exercise jurisdiction over them in the name of the crown. Colonel Nicholls, with ships-of-war and an armed force, landed at Boston in the summer of that year, and, demanding and receiving reinforcements from the Massachusetts and Connecticut Colonies, appeared in New-York Bay about the beginning of autumn.

The result of the expedition is well known—the resolute behavior of Governor Stuyvesant, the councils at the old Stadt-house, and the easy capitulation of the town by the fat burgomasters. New Amsterdam took the name of the city from which the English duke derived his title, and the Dutch officials gave place to a new government formed in harmony with the colonial laws established by the English king.

Colonel Nicholls, after the reduction of Manhattan, turned to Captain Willet as a man of an even disposition and a well-poised mind, a professional merchant, and a fluent speaker of Dutch, to assist "in modelling and reducing the affairs of the newly-acquired settlements into good English." He wrote to Governor Prince, earnestly requesting that Captain Willet might have such dispensation from his official duties in Plymouth Colony as to act as his assistant, and pointing out his especial fitness for the work.

The request was granted, and Captain Willet entered at once upon his difficult labors in New York. He was already favorably known to the Dutch, and his appointment was received by them with satisfaction.

The code of laws established by the Duke of York and Albany for the government of New York, and which continued in force till the period of the revolution in England, read strangely to-day. We extract a few from those compiled under the direction of Governor Nicholls, in 1664, which were then known as the Duke's Laws. There is a wide difference between this old Leviticus and the statute-book of to-day. Truly, "Tempora mutantur, et nos mutamur in illis."

Capital Laws.—"1. If any person within this Government shall by direct exprest, impious or presumptuous ways, deny the true God and his Attributes, he shall be put to death.

"2. If any person shall Commit any wilful and premeditated Murder, he shall be put to death.

"3. If any person Slayeth another with Sword or Dagger who hath no weapon to defend himself; he shall be put to Death.

"4. If any person forcibly Stealeth or carrieth away any mankind; He shall be put to death.

"5. If any person shall bear false witness maliciously and on purpose to take away a man's life, He shall be put to Death.

"6. If any man shall Traitorously deny his Majestyes right and titles to his Crownes and Dominions, or shall raise armies to resist his Authority, He shall be put to Death.

448. The population of Savannah is increased several thousand in the business season, by seamen, artisans, and laborers, from abroad, a fair portion of whose deaths are added to the death record, while no account of these is taken in the census. If these were added to the census, the ratio percentage of mortality would of course be less.

"7. If any man shall treacherously conspire or Publicly, attempt to invade or Surprise any Town or Towns, Fort or Forts, within this Government, He shall be put to Death.

"8. If any Child or Children, above sixteen years of age, and of sufficient understanding, shall smite their Natural Father or Mother, unless thereunto provoked and for their selfe preservation from Death or Mayming, at the Complaint of the said Father and Mother, and not otherwise, they being Sufficient witnesses thereof, that Child or those Children so offending shall be put to Death."

The enforcement of a law like the following during the War for the Union would frequently have quieted the excitements and agitations of Wall Street, and have often silenced the click of the telegraph with its gossip news:

Lying and False News.—"Every person of age of discretion which shall be reputed of fourteen years or upwards, who shall wittingly and willingly forge or Publish fals news whereof no Certain Author nor Authentique Letter out of any part of Europe can be produced, whereby the minds of People are frequently disquieted or exasperated in relation to publicke Affairs, or particular persons injured in their good names and Credits by such Common deceites and abuses Upon due prooffe made by Sufficient witnesses before the Governour or any Court of Sessions the Person so Offending in ordinary Cases shall for the first offence be fined ten shillings, for the second offence twenty shillings and for the third offence forty Shillings and if the party be unable to pay the same he shall be Sett in the Stocks so long, or publickely whipt with so many stripes as the Governor or any Court of Sessions shall think fitt not exceeding forty stripes; or four houres Sitting in the Stocks, and for the fourth offence he shall be bound to his good behaviour, paying Cost or Service to the Informer and witnesses, such as shall be judged reasonable satisfaction, But in Cases of high nature and publicke Concernes, the fine or punishment shall be increased according to the discretion of the Governor and Council onely."

The following laws exhibit the spirit of the age as well as the eagerness of men in authority, whether Protestant or Catholic, to compel others to think like themselves:

"All Jesuits, Seminary Priests, Missionaries, or other Ecclesiastical person, made or ordained by any power or Jurisdiction derived or pretended from the Pope, or see of Rome, residing or being within the Province, to depart the same, on or before the first of Nov. 1700.

"If any such continue, remain, or come into the Province, after the said first of November, he shall be deemed an Incendiary, a disturber of the publick peace, an Enemy to the true Christian Religion, and shall suffer perpetual imprisonment.

"If any such person, being actually committed, shall break Prison and escape, he shall be guilty of Felony, and if retaken shall die as a Felon.

"Persons receiving, harbouring, succouring, or concealing any such person, and knowing him to be such, shall forfeit the sum of 200 pounds, half to the King, for and towards the support of the Government, and the other half to the prosecutor, shall be set in the Pillory three days, and find sureties for their behaviour, at the discretion of the court.

"Any Justice of peace may cause any person suspected to be of the Romish Clergy to be apprehended, and if he find cause, may commit him or them, in order to a trial.

"Any person, without warrant, may seize, apprehend, and bring before a Magistrate, any person suspected of the crimes above, and the Governor, with the Council, may suitably reward such person as they think fit."

Captain Willet encountered many difficulties in his efforts to establish pacific measures. The Dutch were hostile to the English, and the Indians were unfriendly toward the Dutch. But he succeeded so well in harmonizing the discordant elements that he won the sympathies of the new subjects, and received from them the title of Peacemaker. Immediately after the organization of the government, he was elected the first English Mayor of New York, which office he filled so acceptably as to secure a reelection on the following year. He afterward was chosen umpire by the Dutch to determine the disputed boundary between the New-York and New-Haven Colonies. When the two years of his mayoralty had expired, he returned to his home in Rehoboth.

Captain Willet was a man of liberal religious views, and did not sympathize with the exclusiveness of the colonist. He probably had connected himself in youth with the Reformed Church in Holland. Shortly before his retirement from public office he made the acquaintance of the Rev. John Miles, a Baptist clergyman who had been driven from his living in Wales by the Act of Conformity of 1662—an acquaintanceship that ripened into warm friendship, and yielded generous fruit. In 1667, Captain Willet and Mr. Miles secured from the Plymouth Court the grant of a township which they named New Swansea, from the old home of the Welsh pastor and the Sea of Swans near his home in Wales. Here they established a church, Baptist in name, but open in communion, the covenant defending in powerful language the equal rights of Christians to the table of the Lord. The mode of baptism to be administered was to be left in each

case to the choice of the candidate, and the church, free from all ecclesiastical impedimenta, went vigorously to work and soon drew to its fellowship many strong men from the colonies. The Presbyterian adventurers from Harlem-Meer sung sweetly with the exiles from the Severn; Baptists, Congregationalists, and Quakers, worshipped under the same roof, and before the pulpit of a liberal Baptist elder:

"We legends read of Church and State,
Of wars in lands decaying—
The banner of the Cross in hate
Uplifted o'er the slaying.

"A better legend lingers here
In stainless history given:
Sweet sung the men from Harlem-Meer
With exiles from the Severn."

Captain Willet, shortly after the grant of the township of New Swansea, made proposals to the church and to the town concerning the admission of new settlers:

1. That no *erroneous* person be admitted into the township as an inhabitant or sojourner.

2. That no man of any evil behavior, as contentious persons, be admitted.

3. That none may be admitted that may become a charge to the place.

These proposals were "ratified, confirmed, and settled as a foundation-order" by the church and the town.

It should be here stated, in justice to these worthy men, that this last proposal was not intended to disqualify unfortunate persons for citizenship, but to keep out the unthrifty. All well-meaning persons were welcome to the township, however poor.

Here, amid the pine-groves of Swansea, near the calm waters of the Narragansett, Captain Willet passed his declining years. Respected by the expanding colonies, revered by the church and by the inhabitants of the town he had founded, and beloved by a numerous family, the close of his life was serene and happy, and he passed away peacefully at last, as one goes home at eventide after resting a while on the sun-sprinkled sheaves of a bountiful harvest.

Captain Willet married Mary Brown, the daughter of John Brown the elder, at Plymouth, by whom he had thirteen children. His grandson, Francis Willet, was a prominent man in the colony of Rhode Island. His great-grandson, Colonel Marinus Willet, served with distinguished honor in the Revolutionary War, and was also elected Mayor of New York. The descendants of Captain Willet are numerous in New York and in other sections of the country.

His house was a fine one for colonial times, and relics of it still remain. One of the doors may be seen in an antiquarian collection in the possession of the city of New York. Rhode-Island antiquarians have bricks from the chimney, and a house in South Providence, occupied by Samuel Viall, Esq., contains bricks used in building the old Willet Mansion (probably imported from Holland), and two doors of like antiquity that retain the fantastic ornamental painting of a departed age. Captain Willet's sword is in the keeping of the city of New York.

His grave is neglected, but antiquarians sometimes find their way to the sequestered spot, and decipher the rude inscription amid the moss and the fern. It would seem that the defender of infant colonies, the founder of flourishing churches and towns, and the first English mayor of our great metropolis, should have a more appropriate memorial than a rough stone to mark the spot where rests his dust.

H. BUTTERWORTH.

FOOD IN CENTRAL AFRICA.

"TELL me what a people eat, and I will tell you what they are," wrote Brillat Savarin in his great work; and the inferior style of dinner which prevails on the African Continent would probably have enlisted his sympathies on behalf of the slave-owners had he lived in the days when that question was so angrily discussed. It is, in fact, impossible to deny that cookery and civilization are inseparably connected. The Orientals have never thoroughly acquired the art of dining, and have, therefore, always stopped short at a certain point. But although the negroes are decidedly low in the social and culinary scale, they are, both as men and as diners, superior to many

other races; for instance, to the aborigines of Australia, the Andaman-Islanders, and various tribes in America and the Indian Archipelago. The African boils his food. He is, therefore, acquainted with pottery, one of the most useful and one of the most elegant of the rude arts. The Bushmen of South Africa, who are usually regarded as a race entirely distinct from the negroes, frequently subsist in a very miserable manner on roots, berries, and even locusts. These insects are highly relished by many negro tribes, and are eaten as a *hors-d'œuvre*, or accessory, as we eat shrimps and prawns. But the Bushmen eat them vulgarly, in order to allay the cravings of hunger. This fact alone would be sufficient to enable the gastronomic ethnologist to assign them a very inferior position in the family of man, and the observations of travellers and anatomists justify him in so doing. In considering the food of Africa, therefore, the Bushmen will be placed on one side.

The Africans may be divided into three classes:

1. The purely pastoral, who live on milk and meat, with the slight and irregular addition of wild grain from their pastures or of corn collected from other people's stores.

2. The purely agricultural, who eat only vegetables.

3. Those who subsist on fish.

Between these classes there are various sub-classes, or classes of transition, and these are by far the most numerous. Whether there exists a people who have never tasted grain, or who have never tasted meat or fish, may perhaps be doubted. Certainly the pastoral, hunting, and fishing tribes of Africa usually combine a little agriculture with their principal pursuits, or obtain some farinaceous food by selling skins, smoked fish, etc., to the agricultural tribes. These again, though they live on vegetables, usually contrive to taste meat from time to time. They have invariably (as far as my experience goes) domestic animals—fowls, goats, sheep, etc., which they kill on great occasions. They get an antelope now and then, and some tribes have always their grandmothers to fall back upon. Among the agricultural or starch-eating tribes oil is the substitute for meat. Some physiologists assert that farinaceous substances combined with oil supply all that is necessary to human life. Be that as it may, in the forest-regions of equatorial Africa and elsewhere meat is the rarest of all luxuries, and in such countries the slaves must pass long periods of time without tasting it. Even the dogs are there obliged to adopt a vegetable diet. It has been inferred from such facts as these that a vegetable diet is proper and natural in a hot country, and, if the Africans showed any antipathy to meat, there might be some foundation for this theory. But the fact is, they are so fond of meat that they will eat "gamey" crocodile and other carrion substances from which a starving beggar in England would turn in disgust. It is quite possible that an Englishman should eat less meat in the tropics than he takes at home, but vegetarianism is as wild an outrage on the laws of health in one country as in another. If a man vegetates (as the Africans often do), he can live on vegetables, but, if he works hard, either with his head or his limbs, he requires good solid food to repair the waste. I have been among a people who never breakfast, but who eat once a day only, and then very sparingly. But what is their occupation? Sleep and talk. When they go on a journey they break through their usual rule, and eat before they start. Yet with all this I am willing to admit that habit has much to do with the quantities of food that we eat, which must appear extraordinary to the African, for an alderman devours as much in a day as would serve him for a month. No doubt a large part of that which we eat simply passes through the system without yielding up any of its nourishing powers, and probably the savage derives the full benefit of his simple meal.

I shall not enter into long details, as it would be very easy for me to do, respecting the various forms of food which exist in the African peninsula, and the elaborate methods by which many of them are prepared. I shall content myself, for the present at all events, with stating as briefly as possible the principal articles of food in Central Africa, and these will be found to depend upon the physical geography of the country.

The border regions between the Sahara and the Soudan are inhabited by nomadic tribes who live chiefly on milk, and who pass from pasture to pasture according to the rains. Southward of this region we enter the fertile plains of the Soudan, and here we find in some places rice, in others millet or maize, forming the staple. But meat is also abundant, and milk is an article of daily diet over the plateau

which extends southward till it merges into a range of forest-covered hills. From these mountains to the sea all is forest; cattle become scarce. In some parts rice still holds its ground; in others, cassava, plantains, eaten in the half-ripe or starchy stage, and sometimes yams, form the bread of the people. In these dark and gloomy forests even wild animals are rare, and, unless there are rivers in their neighborhood supplying fish, the inhabitants live in a very poor way. In such forest-regions the palm-oil-tree is usually found, and its produce, which is used here in the candle and soap making business, is there much thought of as an article of food. In the higher plateau this tree does not exist, and the oil used in cooking is obtained from the ground-nut (which also supplies much of the olive-oil of Marseilles), or in the form of vegetable fat from the famous shea-butter-tree of Park.

There are various articles of food in Africa which form a commerce of their own. Salt, for instance, doubtless creates more movement and interchange among the African tribes than gold itself. It is supplied to Central Africa from the mines in the desert on one side, and from the European settlements on the other side. Corn is largely exported from the Soudan states to the oases of the Sahara. I found an active trade going on in rice and gold-dust between the miners of Bouré and the adjoining agricultural tribes. Smoked fish is hawked about the country in many parts, and there is a peculiar fruit called the *kola*, or *gooroo*, somewhat resembling the chestnut in shape, very bitter, but which has the effect of making water that is drunk afterward taste like *eau sucrée*, or, according to one observer, "like white wine and sugar." It is most eagerly sought after by all Mohammedan tribes. It is not only employed as a comfit, but is used mystically and emblematically in all their marriages, negotiations, and oaths, and is so highly prized in the upper parts of Senegambia that, according to an old traveller, "fifty of them will buy you a wife." Yet on the Kru Coast and the Gold Coast, where it grows abundantly enough, no attention is paid to it by the natives.

With respect to cooking, the Africans, as I have before observed, are a *boiling* people. Every thing goes into the pot, is served in a calabash, or wooden bowl, and is eaten with the hand. Oil, tree-butter, or cow-butter (according to the latitude), flavors the corn, the rice, the plantain, the yam, or the cassava (which last is the worst food of all); and the mess is strongly seasoned with peppers, sometimes in such fiery fashion that my lips have swelled up after a few mouthfuls had been taken. The young leaves of the baobab (*Adansonia*) are much prized in native cooking, and the celebrated *palava sauce* is so elaborately compounded that it can only have been invented by a Soyer among the negroes. They usually consider it unwholesome to eat eggs or fresh (that is, unsalted) butter, or to drink new milk, which they always prefer in the form of curds. The pagan tribes drink also large quantities of palm-wine by tapping the tree, collecting the sweet sap, and fermenting it in the sun. They also brew a sweet beer from maize or millet, or they make a kind of mead.

To sum up, if we divide Africa into two geographical regions, the one an open plateau at some elevation above the sea, and the other consisting of forest and marsh, sometimes mountainous and sometimes forming alluvial plains, we shall find the first region inhabited by negroes partly Mohammedan, possessing cavalry, and walled towns, and everywhere displaying a certain energy of character; the second, by pagan savages, living in miserable villages, constantly at war, and engaged in no regular commercial intercourse with one another.

In the first region agriculture has made some progress. The fields present a clean and flourishing appearance; the hills may be seen covered with cattle, while ricks of rice and corn, or dry granaries, like houses in miniature, gladden the eye of the hungry traveller. There are markets in the town, where meat is often exposed for sale, and people even stand at the side of the road to offer onions and such minor articles of food to the passers-by.

In the second region the women are the agriculturists, and plant just enough to keep their husbands and themselves from starving. They can endure hunger, and often die peaceably of starvation, but they cannot endure work. They have no cattle, but here and there a goat or a sheep and a few fowls. These are their possessions, which they seldom eat, but keep to sell for a little finery, or for the salt which is necessary to sustain even their miserable lives. The traveller who ventures among such a people must endeavor to acquire that noble indifference about dinner which has been so much lauded by philosophers.

WINWOOD READE.

TABLE-TALK.

It may be almost questioned whether there exists in any channel of public secular expression an instinct for telling the truth. That politicians should habitually give intentionally a false color to the subjects upon which they expatiate, is what we have long learned to expect; but, when we find professed moralists, public reformers, people who claim to have weighty statements to make or valuable lessons to inculcate—when we find this class far more anxious to be sensational than sound, or pungent than truthful, we may well be perplexed as to the fountains which shall supply us with pure waters of learning and wisdom. Our lecturers, especially, might reasonably be supposed to rest under the obligation of truth in their teachings. Men who come before others to instruct them, ought neither intentionally nor even ignorantly to mislead their hearers. A public teacher—whether of the pulpit, the lecture-room, or the press—has no right to make a misstatement. He is bound not only to say what he honestly believes to be true, but he is bound also to make thorough research in order that what he believes to be true shall not be idle or vague impressions, but sound deduction from ascertained facts. A man is often almost as culpable in giving vogue to an assertion which he has not investigated, as in deliberately inventing a lie. That is a felicitous touch in Sheridan's "School for Scandal" which asserts that when the drawer of a scandal cannot be discovered, it would only be good law to demand reparation of the indorser. Our public lecturers, especially those who discuss social questions, have apparently abandoned every pretension to honesty. To be racy, smart, piquant, severe; to set on their hearers to laughter; to say things that will titillate the fancy, flatter the pride, or give a sort of intellectual intoxication to the imagination; to utter rude or hurtful things of women, in order to amuse a crowd of men; to make husbands and fathers objects of racy ridicule in the eyes of ladies; to make our neighbors appear absurd; to be satirical and eloquently critical; to laugh at this man's picture, or that man's book—to go about, in brief, as literary mountebanks, and, like the court-fools of old, amuse the world by satire and jest—this thing is their ambition. They encourage the vice of extravagant overstatement, which is prevalent enough without them. They contribute largely to that spirit of inaccuracy which seems grounded in the very foundations of society. Dr. Johnson was wont to assert with emphasis that the habit of truth must be inculcated in children by the most rigid enforcement; they should not be allowed to digress in the smallest details, even with innocent intent, but, if trained always to note carefully and report accurately, they would thus acquire truth-telling as a habit as well as a principle. We rather reverse all that now. Absolute lying is still a cardinal sin; but, no matter what false coloring may be given to a statement, if by so doing there is a little fun for the listener, or a little fancy in the inventor. And this sort of thing public speakers are

largely responsible for; more so than journalists, whose sins are many, but who have not a crowd to amuse at any cost, and whose statements are often face to face with their contradictions. We might cite some instances of the thing we complain of, but cannot do so without appearing invidious.

— A writer in the *Edinburgh Review* finds in the peasant-proprietary system prevailing in France one great cause of that country's recent misfortunes. The English Liberals have long been advocating the introduction of the French system into England, and have strenuously maintained that many of the existing ills in England and Ireland would disappear under a system which made cultivators of land proprietors instead of tenants. But the writer in the *Review* believes he has discovered the fallacy of that argument. The French peasantry are ignorant and narrow-minded, careless of every thing but their individual welfare, afraid of nothing so much as revolution, distrustful of all political innovations, with no care for the state, and hence without patriotism. They went reluctantly into the army, and were eager to return home again at any cost of national reputation. The cities alone, according to the *Reviewer*, exhibited love of country. It must seem extraordinary to every American that the ignorance and selfishness of the French peasantry should be attributed to a system that in the United States has lifted farmers far above the level of the same class in any other country. Land is not subdivided here into petty plots as in France; but the great fact that the larger part of our cultivated soil is divided into small farms, and owned by those who cultivate them, has been the rock of our political fortunes, the foundation of our prosperity and civilization, and remains the pledge of our future welfare. With us it has been the very source and fountain of patriotism. It has been the means of eliminating from our social organization a peasant-class altogether. Our farmers are men of intelligence, of social position, often of large culture, and are notable for high qualities of character. Love of country is a passion with them. In America the noblest and best thing we have to point to is our landed democracy, which more than any thing else distinguishes us from other lands, and more than any thing else marks the true nature of our superiority. We use the word superiority as applicable solely to the higher average level of our intelligence and culture. In view of these facts, it is certainly remarkable to find an Englishman attributing the defects in the character of the French peasants to their proprietary system. He may be certain the cause lies elsewhere. It is equally surprising to find him locating patriotic virtue in the cities solely. Does he not mistake the froth and revolutionary hubbub of the cities for a higher virtue? His judgment is an entire reversal of our American experience; for here the great towns have proved, what Jefferson predicted of them, "ulcers on the political body." Political debauchery and flagrant misrule have characterized more or less most of them while the great rural populations have been true to the best interests of the nation.

— The "Chinese question" seems more and more to occupy public discussion, but we doubt if any theme before the public admits of such wide differences of statement, or includes so many diametrically opposed assertions. At this moment we have just turned from one paragraph in a leading paper to another in a journal equally conspicuous, in which one utters great apprehensions as to the presence of Chinese in America, and the other draws a very different picture. One predicts, among other evils that are to arise from the large Chinese immigration, the introduction of Asiatic pestilences on the Pacific coast. The Chinese settlements, according to this account, are so foul and filthy, and the utmost efforts of sanitary commissions so unavailing in inducing decent habits among these heathen, that epidemics in due time are sure to be bred from them. The foulness and degradation of the Celestials are presented in this paper with great force. But the other article referred to—which chanced to meet our notice after reading the preceding one—gives a different idea of the new-comers. From this we learn that the Chinese in California are "docile and willing, sober, frugal, and industrious." The authority for these assertions is Mr. Pelham W. Ames, whose statements are the fruit of personal observation. The Chinese, according to Mr. Ames, have been exposed in California to every indignity; they have been robbed, murdered, and beaten with impunity. "The cruel wrongs inflicted upon these people," he says, "are a blot upon our national record." The prejudices against the Chinese are intense, and no doubt there is at least some truth in Mr. Ames's statements. But which are we to believe—that the Chinese are a foul, dangerous, pestilence-threatening, demoralizing element, or a valuable addition to our productive labor?

— In the discussion on the subject of underground railroads in New York, the successful operation of such roads in London is always brought forward as a strong argument in their favor. The facts, however, do not seem to be altogether on one side of the question. We find in the English journals a report of a meeting lately held in London to oppose a modification of the Metropolitan and St. John's Wood Railway charter, by which it was proposed to allow heavy freight-trains to run on the line. Dr. Musgrave, who occupied the chair, stated that "his house was so jolted by the present passenger-traffic that there was not a single article of furniture which was not rattled about. It was quite certain that, if the Midland Railway had the power conferred upon them to run goods-trains over this line of railway, there would be no peace day or night. He could only foresee that most of the houses, if that traffic were carried over the line, must fall down." Dr. Musgrave's troubles, however, are not comparable for intensity with those of "a resident in the Finchley Newroad," who said that "the mere shifting of the empty trains from one line to another near his house had caused it, to a certain extent to give way—the back of his house evidently so. Between his breakfast-room and the pantry a hand could

be put right through and seen in the opposite room. Other parts of the house were constantly dropping from the vibrations, and it was in such a bad condition that if a dog ran across his dining-room the spoons and forks clattered on the plates or dishes on which they might be lying." He further added that he had been informed by a surveyor that his house was in a very dangerous condition, and, if he (the speaker) let any thing drop heavily, he might have "the back front" of the house come down.

— There is something singular about the fascination which diamond-mining exercises over the popular mind. Adventurers from every part of the world are rushing to South Africa, prepared to encounter dangers, privations, hardships, and toil, in the hunt after the precious stones, with not one chance in a thousand of finding them. The official statement at the Cape of Good Hope is, that in 1870 the total value of the diamonds found was only a little more than a million dollars. The amount of energy and labor wasted in gathering them would have produced ten times as much in solid cash, if applied to the culture of cotton or tobacco.

Foreign Items.

OCTAVE FEUILLET, the French Academician, and author of "Camors" and "The Romance of a Poor Young Man," is in trouble. He was one of the most ardent adherents of the Empress Eugénie, through whose influence he obtained a very comfortable sinecure, the position of librarian at the palace of Fontainebleau. When Eugénie fled to England, Octave Feuillet thought that he was no longer safe in France either, and fled to England without taking any steps to secure from injury the large and valuable library intrusted to his care. No sooner had Feuillet left Fontainebleau than some of the most valuable books were stolen, and the remainder disappeared during the occupation of the place by the German troops, so that, when Feuillet returned to his post after the capitulation of Paris, he found nothing but empty shelves. The government has now notified him that his conduct will have to undergo a judicial examination.

Sovereign princes and their heirs-apparent have often not been on the best of terms. The latest instance of this state of affairs is the quarrel between the Czar Alexander II. of Russia and the imperial crown-prince. These two personages differ widely about the war between France and Germany. The czar enthusiastically espoused the cause of the latter, while the crown-prince, instigated, it is said, by his very pretty young wife, who displays considerable ability as a political intriguer, makes no secret of his sympathies for France. Very disagreeable scenes ensued in consequence between father and son. The czar repeatedly ordered the prince from the imperial dinner-table for violently contradicting and even ridiculing him. One day the prince's conduct was so offensive that the czar ordered him to be confined in his rooms for several weeks.

When the Bavarians occupied the charming country-seat and large farm of Eugène Rouher, Napoleon's ex-minister, a peasant offered to show them the place where the proprietor's plate had been buried, provided they would

leave his own humble home undisturbed, and not take his cattle from him. The Bavarian soldiers readily agreed to the proposition, and unearthed M. Rouher's plate, which, at a low valuation, was worth fifty thousand francs. A relative of Rouher heard of it, and got the whole back for five thousand francs.

Some time ago the Municipal Council of Lyons unanimously adopted a resolution making Garibaldi an honorary citizen of that city. Nine thousand citizens of Lyons have now signed a protest against that step. They assert in it that Garibaldi, so far from having rendered any valuable services to France, had caused one of the greatest disasters of the war; for it had been owing to Garibaldi's incapacity that Bourbaki's army had been forced to flee to Switzerland.

Eckmann-Chatrian's novels have had an aggregate sale of five hundred thousand volumes in France down to July 1, 1870. During the early part of the war so many orders for copies of such of the novels as referred to the war in Alsace were sent to the publishers that the latter were unable to fill them. Eckmann-Chatrian's home is at the little fortress of Phalsbourg, which suffered terribly through the bombardment by the German troops.

Some speculators in Paris realized enormous profits during the siege. Mirès, the well-known banker, had purchased, a short time previous to the investment of the city by the German troops, one hundred and fifty thousand barrels of flour, which he sold early in October to the government at an advance of one hundred per cent.

The Italian publishers of Manzoni's "Sposi Promessi" announce the appearance of the hundredth edition of that celebrated novel, which has proved to be the most popular book published in Italy for many years past, except one, Silvio Pellico's "Le Mie Prigione," of which one hundred and twelve editions have appeared thus far.

Madame Anna Rattazzi is engaged in writing a book, entitled "Ma Prédiction," and in which, referring to her former literary attacks upon the ex-Empress Eugénie, she tries to prove that the exile of Chiselhurst is principally responsible for the downfall of the second empire.

Villemeussant's Paris *Figaro*, which a year ago had a daily circulation of upward of sixty thousand copies, has now less than seven thousand subscribers. Damaging disclosures about the manner in which the leading editors of the *Figaro* had sold their pens to the imperial government utterly ruined the paper in the estimation of the public.

During the last year of Queen Isabella's reign the average daily circulation of the Madrid papers was only between sixty and seventy thousand copies. The Spanish capital has now three times as many political journals, with an aggregate daily circulation of two hundred thousand copies.

Hacklaender, one of the owners of the *Stuttgart Illustrated News*, is one of the few German novelists who obtained fame and fortune by writing novels. His "Wachtstuben-abenteuer" (Guard-room Adventures) alone yielded him a net profit of over twelve thousand dollars.

A volume of Turkish poems, said to have been written by a young girl of Pera, and most remarkable for their pathos and sweetness, has

recently been published at Constantinople, and, what has rarely happened of late years to a Turkish book, has already had nine editions.

Dr. Strousberg, the Prussian Israelite, who by dint of successful speculations, in the course of ten years, rose from poverty to great wealth, and finally became proprietor of some of the most productive railroads in the kingdom, is reported to have been bankrupted by the war of 1870-'71.

The offers of public libraries, book-publishers, and private citizens in Germany, to furnish books to the library to be formed at Strasbourg, in place of the one which was destroyed during the bombardment of the city, exceed already one hundred thousand volumes.

The French Government has ordered the discontinuance of that costly publication, at the expense of the state, of "The Correspondence of Napoleon I.," the last volumes of which were edited by Prince Napoleon with so little tact and discrimination.

Carl Gutzkow, the great German dramatist and novelist, was so mortified at the cool reception which his new war-play met at the hands of the public, that he withdrew the play from the stage, and declared that it never should appear in his complete works.

Pope Pius IX. has given an order to several Roman fresco-painters to paint the so-called White Hall of the Vatican with frescoes illustrating the adoption of the infallibility dogma by the Ecumenical Council of 1870.

Baron de Brisse, the author of the best French cook-book, and famous for his culinary contributions to the Paris papers, died of heart-disease at Brussels, on the 22d of February.

The Russian papers intimate that Adelina Patti, the Marchioness de Caux, is negotiating with the manager of the Imperial Opera at St. Petersburg for a five or ten years' engagement.

Björnson, the Norwegian novelist, has recently published two small volumes of fairy-stories, which the Scandinavian critics pronounce superior to any thing which Hans Christian Andersen has recently written.

Thiers and Dufaure, ex-ministers of Louis Philippe, are opposed to the restoration of the Orleans dynasty. Guizot, to the great disappointment of the Orleanists, has now taken the same position.

M. de Noë, better known as "Cham," the signature of his droll caricatures in the Paris *Charivari*, was quite severely wounded by the bursting of a shell during the bombardment.

The young Queen of Spain is said to be the author of a volume of novels, which appeared at Florence two years ago anonymously, and which was quite well received by the public.

Duke Ernest of Saxe-Coburg-Gotha, the elder brother of the late Prince-Consort of England, intends to visit the United States and Mexico next summer.

Among the valuable presents which old General von Moltke received during the war in France was a costly sabre sent him by the Shah of Persia.

They say in Madrid that King Amadeo, previous to his arrival in Spain, never read a book written by a Spanish author, not even "Don Quixote."

The Empress Elizabeth of Austria has grown prematurely old. Her face is wrinkled, her eyes are dim, and her features, which were once so delicate, have become quite gross.

Anastasius Gruen, the Nestor of the Austrian poets, has a German translation of Shakespeare's sonnets in press.

Strauss, the Vienna composer of dancing-music, has written an opera, which, despite some charming melodies, proved a failure at its first representation.

A woman was arrested the other day at Brescia, in Upper Italy, on the horrible charge of having poisoned all her seven children.

Four of the new Austrian cabinet-ministers were formerly professors at the University of Vienna.

The wives of Count von Bismarck and General von Moltke are both in very feeble health.

There are now upward of one hundred permanent American residents in St. Petersburg.

The most eloquent preacher in Italy is said to be a young Franciscan monk at Messina.

The Abbé Bauer, the famous preacher at the chapel of the Tuilleries, is now in Vienna.

Miscellany.

President Thiers.

IT is a reasonable opinion held by many that the second empire in France owed its existence to the legend of the first Napoleon, as it was told in the skilful pages of M. Thiers. The first Napoleon exhausted France, and brought his conquerors to take possession of Paris. But that is not all. During the most brilliant period of the first emperor, France was internally in great distress—without commerce, and exhausted by the destruction of men and the want of money. Had the tale been told, not by such a one-sided rhetorician as Thiers, and decorated by such a poet as Béranger, but truthfully by such an historian as M. Lanfrey, Louis Napoleon would never have dreamed his dream—his empire would never have come into existence. He did, however, dream his dream, his empire came into existence, and endured for nearly twenty years, and during its continuance France enjoyed an amount of material prosperity and a growth of commerce, manufactures, and wealth, to which her past history had furnished no parallel. Not many months have passed since the emperor made an appeal to the French people, in effect requiring an answer to the question whether they were so far satisfied with his government as to desire that he should not be controlled without an appeal to them. Between seven and eight million Frenchmen by their votes in effect approved his rule, the negative votes being comparatively few. Sadowa was fought, Prussia grew great, and Germany was consolidating into a mighty power. M. Thiers said, France ought not to have permitted another people to grow great; France was great, and ought to be great, and that the greatness of a neighbor was a detraction from her greatness, and therefore ought not to have been permitted, and ought not to be endured. This view, maintained and propagated by M. Thiers, was indirectly a cause—perhaps the cause—of the war which has created the German empire, and has proved so disastrous to France. With the exception, possibly, of the destruction brought upon the Confederate States of America by the

Secession War, modern history records no case of such a collapse of power, of such calamities as this war has brought upon France. The blame, the whole blame, of this collapse, of these calamities, is laid upon the late emperor. No man in France dare whisper a word in his favor. And the man to whom all France with equal unanimity resorts to govern the country, to obtain peace, and to restore the prosperity of France, is M. Thiers. Of Thiers himself, it has been said that in external appearance it is impossible to conceive a more ignoble little being. He has neither figure, nor shape, nor grace, nor mien; and truly, to use the most unsavory description of Cormenin, he looks like one of those provincial barbers who, with brush and razors in hand, go from door to door offering their *savonnette*. His voice is thin, harsh, and reedy; his aspect sinister, deceitful, and tricky; a sardonic smile plays about his insincere and mocking mouth; and at first view you are disposed to distrust so ill-favored a looking dwarf, and to disbelieve his story. But hear the persuasive pigmy, hear him fairly out, and he greets you with such pleasant, lively, light, voluble talk, interspersed with historical remark, personal anecdote, ingenious reflections, all conveyed in such clear, concise, and incomparable language, that you forget his ugliness, his impudence, insincerity, and dishonesty. You listen, and, as Rousseau said in one of his most eloquent letters, "in listening, are undone." As a journalist he was successful, as an historian he was popular, as a minister he was notorious, and national to a certain extent. He has, no doubt, many talents and many defects; but his successes in life are more owing to his worst vices than to his negative virtues. He is probably the most intelligent man in Europe, if a perception of the wants and wishes of the million indicate intelligence; but some think him also one of the most insincere, mocking, and corrupt of public men, and at the bottom one of the shallowest in all sound knowledge.

The Old English Squire.

The country squire of the last century, whether he was a Squire Western, or a Squire Allworthy, resided for the greater part of his life in the parish where he was born. The number of freeholders was four times what it is at present; plurality of estates was the exception; the owner of land, like the peasant, was virtually *ascriptus gleba*—a practical reality in the middle of the property committed to him. His habits, if he was vicious, were coarse and brutal—if he was a rational being, were liberal and temperate; but in either case the luxuries of modern generations were things unknown to him. His furniture was massive and enduring. His household expenditure, abundant in quantity, provided nothing of the costly delicacies which it is now said that every one expects and every one therefore feels bound to provide. His son at Christ-church was contented with half the allowance which he now holds to be the least on which he can live like a gentleman. His servants were brought up in the family as apprentices, and spent their lives under the same roof. His wife and his daughters made their own dresses, darned their own stockings, and hemmed their own handkerchiefs. The milliner was an unknown entity at houses where the milliner's bill has become the unvarying and not the most agreeable element of Christmas. A silk gown lasted a lifetime, and the change in fashions was counted rather by generations than by seasons. A London house was unthought of—a family trip to the Continent as unimaginable as an outing to the moon. If the annual migration was something farther than, as in Mr. Primrose's par-

sonage, from the blue room to the brown, it was limited to the few weeks at the country town. Enjoyments were less varied and less expensive. Home was a word with a real meaning. Home occupations, home pleasures, home associations and relationships, filled up the round of existence. Nothing else was looked for, because nothing else was attainable. Among other consequences, habits were far less expensive. The squire's income was small as measured by modern ideas. If he was self-indulgent, it was in pleasures which lay at his own door, and his wealth was distributed among those who were born dependent on him. Every family on the estate was known in its particulars, and had claims for consideration which the better sort of gentlemen were willing to recognize. If the poor were neglected, their means of taking care of themselves were immeasurably greater than at present. The average squire may have been morally no better than his great-grandson. In many respects he was probably worse. He was ignorant, he drank hard, his language was not particularly refined, but his private character was comparatively unimportant; he was controlled in his dealings with his people by the traditional English habits which has held society together for centuries—habits which, though long gradually decaying, have melted entirely away only within living memories.

The Spring-time.

Now, at this season, when Nature is marshalling all her forces for her great summer work, and in every garden-enclosure the busy hum of preparation gives token of the season for spading, and planting, and pruning, the literature of the time takes a special turn. Old books on gardening come down from the shelves, and new books reach home from the booksellers. What to plant, and where to plant, and how to plant, are all at once questions of great import. The seedsmen become the most important tradesmen in the town. People hie to the shops to consult with them, to gather advice from them, and to plunge eagerly into the pages of their catalogues. The seedsmen's catalogues, in fact, are now an important element in our civilization. And how attractively some of them are gotten up! Here before us is the issue of B. K. Bliss & Co., of New York. Of the bewildering lists of seeds it announces, no mortal could keep a record. Of course, it exhausts the needs of every gardener, whether his field be the practical or the ornamental; and then it is illustrated with such superb-looking tomatoes, done in color; such luscious beets, such charming pansies—in fact, it is a pretty book to look at, and in April a very useful one to consult. In the spring every man feels the old gardener Adam working in him a little; he will pant for the odors and the sweets of the early blossoms; he will pause at the windows of the florists in a sort of rapture; peer over the paling of his neighbor's fence with a subdued ecstasy, and never be content until he has given the old leaven in him its way by buying at least one package of seeds, whether he ever plants them or not.

International Exhibition.

There is to be an International Exhibition this year at South Kensington, London, and yearly forever after, it appears, from the statement to that effect made by her majesty's commissioners, and the inference to be derived from the permanent character of the buildings. The edifice is in the decorated Italian style, with mouldings, cornices, columns, and courses, in buff-colored terra-cotta; the brickwork being of the hard red Fareham bricks, so as to match

the garden architecture, and harmonize with the new Museum buildings, which are rising in front of them. The terra-cotta and red Farnham bricks are more durable against the stress of a London winter than even granite. The building is capable of holding about fifty thousand persons. Briefly, the objects the commissioners have in view are as follow: They propose, in the first place, to make an International Exhibition a permanent institution of the country, giving to industrial art the same opportunity that is afforded to fine art by the annual exhibitions of the Royal Academy. In the second place, they produce the area over which the exhibition shall spread itself, by reducing the various industries into groups, and, taking certain of these each year, bring the entire industry of the country under review every seven or eight years, fine art being a standing division of the programme. And, in the third place, to restrict the conditions under which exhibits have hitherto been received, by making all articles undergo a preliminary sifting, through appointed committees of selection, thus excluding all works that do not possess sufficient artistic merit to warrant their exhibition, and by the further exclusion of mere masses of natural products. The manufactures exhibited this year will be woollens and pottery, in addition to fine art of every description. France, it is said, notwithstanding the war, will be a large contributor; but, what with the absorption of the energies of the peoples of France and Germany in the war, and an apparent want of public interest in England in the project, it is not probable that the exhibition of 1871 will rival its predecessors of 1851 or 1862.

The Hohenzollerns.

The first of the Hohenzollern family honors are traced originally to the attachment of a certain Count Frederick von Zollern to the Emperor Frederick I. He was rewarded with the hand of the daughter and heiress of the Burggrave (Count of the City) of Nuremberg in 1180, and in 1192 was publicly installed into the burgraviat, an important imperial dignity, which continued in his family for six succeeding generations. The burgraves did constant good service to the emperors, and were usually in their confidence; and the Emperor Sigismund took into his especial trust a Burggrave Frederick of his time, making him his chief associate in his magnificent plans for restoring the full power of the Roman empire and the dignity of its head. Part of this design was to be carried out by the elevation of his friend to the Kingship of Rome. This was never carried out; but by way of preparing the way for such a dignity, the emperor made the burgrave the Marquisate of Brandenburg with the rank of elector in 1415, and Frederick I., the first elector, was solemnly invested with the dignities of his office in May, 1417. The House of Zollern, or Hohenzollern as it now came to be called, was thus transplanted from South to North Germany solely by imperial favor, and became the chief guardian of the empire against Slavonic aggression. This charge was abundantly justified, as all readers of modern history know. True, the part played by the Hohenzollerns in the great Thirty-Years' War was not very brilliant or honorable. But by pacific means or warlike exertions they maintained their border-land constantly intact, and frequently enlarged the marquisate, until, two hundred and sixty-one years after the exaltation of his family to the electorate, Frederick III. placed the royal crown on his own head in the palace at Königsberg, and declared himself King of Prussia on the 18th of January, 1701. We need not repeat here how the kingdom has

grown into the empire, for to do so thoroughly would be to write the whole history of Europe for the last hundred and seventy years.

William Hazlitt.

With all his eloquence and subtlety of thought, Hazlitt was the prey of the most crazy fancies, dreading all the refinements of social life, and writhing at the thought of being considered strange and ungainly by the footman whom he despised. Even with his oldest friends, like Lamb and Leigh Hunt, Hazlitt preserved the wildness and shyness of a misanthropic recluse. He entered a room, Mr. Paterson has recorded, as if he had been dragged there in custody, shuffled sidelong to the nearest chair, sat himself down on one corner of it, dropped his hat on the floor, and after his set phrase, not always appropriate, of "It is a fine day," lapsed into dreary silence, and seemed to resign himself moodily to his fate. If the talk did not please him he sat half-absorbed and indifferent, till at last by a sudden impulse he started up, and with an abrupt "Well, good-morning," shuffled to the door and blundered his way out. His self-consciousness was morbid almost to madness, and his pride extreme. His daily life was of that suicidal character sometimes adopted by authors who despise the laws of health, and suffer the inevitable penalty of softened brain or premature paralysis. He usually never rose till one or two o'clock, and brooded over his breakfast of intensely strong black tea and a toasted French roll, till four or five in the afternoon, "silent, motionless, and self-absorbed" as a Hindoo Yogi. His tea was generally very strong, as he half-filled the teapot with tea. For the last four or five years of his life, Hazlitt drank no liquids but tea and water—of the latter he sometimes drank three or four quarts while talking after supper. This meal, of meat or game, was invariably taken at a tavern late at night. His favorite haunt for his great talks was the Southampton Coffee-house, in Southampton Buildings, Chancery Lane. Any small slight, or the mere fact of the bill being brought him before he asked for it, scared him from a tavern or chop-house for years. If he went to the theatre, even to see the wonderful Kean, Hazlitt hid himself in a back corner seat in the second tier of boxes, and there he sat, like a sullen owl, shrouding himself from view, and trusting apparently to mere quick glances and odd moments of listening.

Ancient Marriages.

In the days of the patriarchs a suitor had to pay for his wife. But in our more advanced civilization a woman who has a dowry may be said to pay for herself. At the first glance, the contrast would seem all in favor of the ancient system. In those times, it may be said, men must have put a wonderful value on women, when they actually paid a sum for the privilege of keeping them. Halcyon days for those that reared daughters, when the expense of bringing them up was reimbursed by their sons-in-law. There we must look for the real golden age, when the daughters of men were so eagerly coveted, and handsomely paid for. And then, what a miserable age is ours in which the old happy state of things is entirely reversed, and men can hardly be persuaded to take wives, unless, by means of a dowry, they are bribed to keep them! On a closer inspection, however, we find that our apparent degeneration is really a development; and that the old practice, so far from being an evidence of the high regard of men to women, is the surest mark of female degradation. The

idea contained in the most ancient forms of marriage prevailing among the Roman people was, that marrying a woman meant acquiring the ownership of her. One ceremony was an ordinary sale; the husband bought the wife from her father with good money, as he did his cattle or his slaves. Another consisted in obtaining the proprietary right over a wife by a year's unbroken cohabitation. The position of the wife was low. In legal parlance, she was said to be the daughter of her husband, at a time when children had no rights of ownership, when all their earnings went to their father, when they were incapable of gaining by any contract, and when even their life was at the father's mercy. So the wife had nothing she could call her own; she was the menial servant of her husband and owner. Moreover, in this phase of society polygamy generally prevailed, a system that signifies and seals the most degrading opinion as to the sphere of woman.

The British Taste for Beer.

The British taste for beer has been of gradual growth, and has been developed from very small beginnings. In all these things a man naturally goes to Shakespeare. You cannot mention any subject under the sun, but Shakespeare has his say upon that subject. Though Chaucer talks of "a glass of moist and corny ale," and his miller prayed for enough good ale, and, indeed, took more than was good for him, yet Shakespeare speaks of that "poor creature small ale;" and Prince Hal and his followers by no means took kindly to beer. The taste has been a gradual taste, just as the improvement in beer has been a very gradual improvement. People liked it when brewed, not "small," but strong. The saying soon crops up, "Blessed be her heart, for she brewed good ale." We find that the astute statesman Charles James Fox shouted out to the electors, "A mug, a mug!" to popularize himself. The famous Isaac Bickerstaff, when he went to Dick's Coffee-house, asked for "a mug of beer." "I observed that the gentlemen did not care to enter upon business till after their morning draught." Beer is essentially a Hanoverian drink. It is said that it kept the race of Brunswick on the throne during the era of the Pretender. It is a large political influence at the present day, and may be said to have a daily newspaper to represent the beery section of the British mind.

Singular Manner of Death.

Sir Henry Durand, an English official of high rank in India, lately came to his death in a singular manner. He was mounted on an elephant, and about to enter in procession the town of Tank. The entrance to the town is by two gateways, standing at right angles to each other, but under the same roof. There appears only to have been room enough in the first gateway for an elephant, carrying a howdah, to pass. From the first to the second gateway the ground rises, and the arch of the second gateway is considerably lower than that of the first. Owing to the dusk of the evening, Sir Henry Durand, who was riding in the howdah of the first elephant with the Nawab of Tank, did not see the danger till he was close upon the fatal spot. He then called out to the driver of the animal to try and back out or turn. Either there was not time enough to do this, or the elephant, becoming excited, refused to obey, and moved on through the gateway. Sir Henry Durand's head came violently in contact with a beam which supported the arch, and he was thrown to the ground, whence he

was picked up insensible. From the first there was great fear of his death, as it was perceived that the spine had been seriously injured. On the following morning he regained his consciousness, and was in full possession of all his faculties till within half an hour of his death. He was able to state briefly his own impression of the accident. The Nawab of Tank experienced a severe contusion on the back of his neck, and had one of his ribs broken.

Simancas.

The small town of Simancas, about six miles from Valladolid, is famous as being the spot selected for keeping the old state-records of Spain, from the reign of Ferdinand and Isabella till a century ago. The records are kept in an old castle, without guns, surrounded by a dry moat. The documents are put up in bundles called Legajos, each containing from five to twenty manuscripts or so. They occupy shelves in endless rooms, and are about eighty thousand in number, i. e., the Legajos; Berengerrothe, I think, says they are about one hundred thousand, but the gentleman at the head of the curators told me eighty thousand. Such curiosities I saw! State-papers about Catharine of Arragon and Henry VIII., letters of Ignatius Loyola, the Duke of Alva, Mary Stuart (our Queen Mary), the will of Isabella the Catholic, the war-accounts of Gonsalvo the great captain, letters of Cervantes, and a host besides. The documents are in wonderful preservation—paper good and white; but the free-and-easy manner in which these valuable documents were handled somewhat astonished me. We saw more than one chamber full of documents of the Inquisition in various towns. A discovery among the papers of the Inquisition of some previously unknown works of Lope de Vega, and Calderon, etc., has been made. These MSS. have been sent to Madrid.

Varieties.

THE following estimate of woman's love appears in an English contemporary: "A Frenchwoman will love her husband if he is either witty or chivalrous; a German woman, if he is constant and faithful; a Dutch woman, if he does not disturb her ease and comfort too much; a Spanish woman, if he wreaks vengeance on those who incur his displeasure; an Italian woman, if he is dreamy and poetical; a Danish woman, if he thinks that her native country is the brightest and happiest on earth; a Russian woman, if he despises all Westerners as miserable barbarians; an English woman, if he succeeds in ingratiating himself with the court and aristocracy; an American woman, if he has plenty of money."

There is a good story told in Washington about a Chinese servant employed by Admiral Porter. On reception-day, the duty of attending door was assigned to Ah Sin. Accustomed to the social usages of his own land, where a visitor's rank is indicated by the size of the card, and where a huge yellow one means the presence of a prince, he treated the little bits of pasteboard with contempt. While nodding his head, and tossing the bits of paper uncereemoniously in the basket, the gas-collector happened to present his bill. The long yellow slip took Ah Sin, and with profound salaams he bowed the astounded gas-man into the presence of the amazed family.

Sydney Smith once told a friend that between ten and seventy years of age he had eaten and drunk forty-four one-horse wagon-loads of meat and drink more than would have preserved him in life and health, and that the value of this over-feeding was something like seven thousand pounds.

Professor Huxley dresses elegantly. He is tall, strong, and gracefully built, but has none of the dense solidity, begot of beer and beef, that is characteristic of modern Britons. His

head is rather square than oval, his hair thick, straight, and black. The forehead is perpendicular and dogmatic; the nose not turned up, but turned into the air; thin, firm-shut lips, above a chin mercilessly firm, and small eyes that sparkle in their sockets.

One of the last illustrations in the *Charivari*, signed "Cham," represents a crowd of Prussians carrying away in their hands, on their backs, and in baskets, all the clocks in France, and Cham remarks: "They may carry off all the clocks, but they will not prevent the hour of vengeance from striking."

The other day, while a teacher was hearing a boy recite his lesson, the following passage occurred: "The wages of sin is death." The teacher, wishing to get the word "wages" out by deduction, asked: "What does your father get every Saturday night?" The boy answered promptly, "He gets drunk."

One of the Prussian shells entered through the roof of a bath-house in Paris, and fell into a bath in which there was a bather at the time. Of course, it did not explode; but the gentleman in the bath immediately vacated it in favor of the new-comer, and got away with a few slight bruises.

The late Robert Barnes, of Evansville, Indiana, bequeathed his entire estate of four hundred thousand to six hundred thousand dollars, without the reservation of a cent, for the purpose of providing for and educating the destitute orphans of Indiana.

A Western paper states that an old lady followed up a bishop as he travelled through his diocese, and was confirmed several times before she was detected. She wished the ordinance repeated because she had understood it was "good for the rheumatism."

Alabama has outstripped every Southern State in the number of miles of railroad built since the war. Alabama has built 296 miles, Georgia 281, Tennessee 155, Texas 132, North Carolina 146, South Carolina 128, Virginia 104, Mississippi 128, Arkansas 90, Florida 44.

Guizot is reported to have said that he would yet live to see France lead the progressive nations of Europe to victory over the despotism of the East. As he is now in his eighty-fourth year, he must be expecting a much longer life than falls to the lot of most men.

"Mother," said a four-year-old, "what season of the year was it when Adam and Eve were in the garden of Eden?" "I don't know, my dear, unless it was summer—a perpetual summer." "Oh, no, mamma; it must have been in the fall, for you know apples were ripe."

If you are a wise man, you will treat the world as the moon treats it. Show it only one side of yourself; seldom show yourself too much at a time; and let what you show be calm, cool, and polished. But look at every side of this world.

Census returns for Michigan foot up as follows: Number of dwellings in the State, 235,637; number of families, 234,725; number of voters, 268,756; number of inhabitants, 1,184,638.

Two posthumous tales by Miss Austen will soon be published—"Lady Susan," one of the very earliest of her writings, and "The Watsons," one of her best productions, but incomplete.

It is announced by authority that Mr. Swinburne has from time to time written several novels, both in English and French, but has no present intention of publishing any of them.

Sir Boyle Roche once said, in reference to persons, all relations to each other, but who happened to have no descendants, that "it seemed to be hereditary in the family to have no children."

Some of the African diamond-hunters have found that they have spent several years' labor and have paid a great deal of freight money for importing into England about six bushels of translucent quartz.

The *Saturday Review* says: "The only fact that can be predicted, with any degree of con-

fidence, of many youths, is that Providence does not seem to have designed them for any thing in particular."

One of the stories told of the Paris siege is that Baron Rothschild, tiring of rat, vainly offered one hundred dollars for a pheasant. He was forced to take fifty sparrows instead, for a pot-pie, at two dollars each.

Nauvoo, formerly famous as the capital of Mormondom, is becoming equally famous for its grape-wine. Sixty thousand gallons were sold last year, and more than that amount is now in store.

Maine's fishing-fleet in 1870 consisted of seven hundred and eighty-six vessels, employing five thousand two hundred and twenty-eight men.

Railroad managers are perhaps not to blame for the conduct of those they employ; but is it not strange that none of them ever hires a civil engineer to run the engine?

The ingenuity of Chinese swindlers is peculiar. They split half-dollars, take out a third of the silver, fill the space with lead, and adroitly close up the cut.

Emerson remarks that "astronomers eclipse planets." This seems a little obscure at first, but it is obviously true—because they discover them.

Foul air is positively benumbing to mind and body. Many a stupid meeting owes its stupidity largely to inadequate ventilation.

It is a somewhat notable fact that fifty-six members of the Maine House of Representatives are freemasons.

The difficulty with the Cuba cable is said to be that Loggerhead turtles bite it off and stop the current of electricity.

Portland has a colored centenarian, whom the *Transcript* of that city calls "one of the dark ages."

Some members of an Indianapolis church lost their church on fire and destroyed it because they didn't like the pastor.

Iowa has amended its laws so as to admit women to practise as attorneys on an equal footing with men.

Female suffrage has been refused in Illinois, Iowa, and Missouri.

The first Spanish-and-Portuguese dictionary ever published has just appeared in Madrid.

Paris has only a fraction over fifty-seven thousand houses.

Berlin has thirty-one theatres.

Detroit boasts four millionnaires.

M. Léon Gambetta is thirty-two years old.

Cannel-coal is found in Virginia.

The Museum.

THE war-canoes of the New-Zealanders are made from the cowrie-pine; the tree is large, and the natives are able to make their canoes of considerable size. Some of them are upward of eighty feet in length, and in consequence are able to carry a great number of warriors. They are built in rather an elaborate manner. First, the trough-like vessel is formed from the tree-trunk; and, as it is intended for sea-voyages, and may have to endure rough weather, it is much wider in proportion than the boat which is only used on rivers, and is, moreover, rendered more seaworthy by gun-wales. These are made separately, and are lashed firmly to the sides of the boat by the ordinary flax-ropes.

Both the head and stern of the canoe are decorated with elaborate carvings, which have as their basis the *contour* of the human countenance and the semi-spiral curve. Perhaps a single canoe-head will have fifty or sixty nu-

man faces on it, each with the tongue protruded, with the cheeks and forehead covered with tattooed lines, and with a pair of goggle-eyes made of the haliotis-shell. The mode which a native adopts when carving these elaborate patterns is as follows: After shaping out the general form of the article to be carved, he fixes on some part which he thinks will be suitable for the purpose, and carves a human head upon it. When this is completed, he pitches upon a second spot at some distance from the first, and carves another head, proceeding in this way until he has carved as many heads as he thinks the pattern will require.

He next furnishes the heads with bodies and limbs, which are always represented in a very squat and ungainly manner, and fills in the vacant spaces with the beautiful curved lines which he loves so well to draw and carve. The minute elaboration of some of these war-ca-

noes is so intricate that it baffles all power of description, and nothing but a well-executed photograph could give a correct idea of the beauty of the workmanship. It is a marvelous example of the development of art under difficulties. It is quite unique in its character, so that no one who is acquainted with the subject can for a moment mistake a piece of New-Zealand carving for that of any other country.

Besides carving the canoes, the Maori paints them with vermilion in token of their warlike

object, and decorates them profusely with bunches of feathers and dog's hair. When the canoes are not wanted, they are drawn up on shore, and are thatched in order to save them from the weather.

Like more civilized nations, the New-Zealanders give names to their canoes, and seem to delight in selecting the most sonorous titles that they can invent. For example, one canoe is called Maratuhai, i. e., Devouring Fire; and others have names that coincide

almost exactly with our Invincibles, Terribles, Thunderers, and the like.

These boats are furnished with a very remarkable sail, made of the rau-pu-rush. It is small in proportion to the size of the vessel, is triangular in shape, and is so arranged that it can be raised or lowered almost in a moment. They are better sailors than would be imagined from their appearance and run wonderfully close to the wind.

Head of a New-Zealand War-canoe.

GUIDE-BOOKS FOR TRAVELLERS,

PUBLISHED BY

D. APPLETON & CO.

Appletons' Railway Guide,

Containing Maps of the Principal Railways in the United States and the Canadas, and a General Map.

Appletons' Northern and Eastern Guide-Book,

Containing an account of the Principal Watering-Places and Summer Resorts. A New Edition. \$2.00.

Appletons' European Guide-Book,

Including England, Scotland, and Ireland, France, Belgium, Holland, Germany, Switzerland, Italy, Spain, and Portugal, Russia, Denmark, Norway, and Sweden. Containing a Map of Europe, and Nine other Maps, with Plans of 20 of the Principal Cities, and more than 150 Engravings. Thick 12mo, tuck, gilt edges. Price, \$6.00.

Skeleton Routes

Through England, Scotland, Ireland, Wales, Denmark, Norway, Sweden, Russia, Poland, and Spain; with various ways of getting from place to place, the time occupied, and the cost of each journey for a party of four, with some of the principal things to see. 12mo. Price, \$1.00.

New York Illustrated.

With 48 Illustrations, and a Map, from drawings made by the best artists. The most complete illustrated memento of New York ever published. 8vo. Price, 50 cents; cloth, \$1.00.

Either of the above sent free, by mail, to any address, on receipt of the price.

ANNOUNCEMENT.

PICTURESQUE AMERICA.

The publishers of APPLETONS' JOURNAL have the pleasure of announcing the completion of arrangements by which Mr. HARRY FENN will for a time give his professional services exclusively to the prosecution of the series of views entitled "PICTURESQUE AMERICA," which for a few months past has been a conspicuous and attractive feature in the JOURNAL. Mr. Fenn will this spring visit SOUTH CAROLINA, GEORGIA, TENNESSEE, and VIRGINIA, after which he will proceed to sections North and West; and, when the summer heats are over, he will visit other Southern localities. It is the design to illustrate every portion of the Union, in a manner far superior to any thing of the kind hitherto attempted, so that in time the series will present a splendid and complete gallery of American landscapes and places. Mr. Fenn, whose vivid and graphic pencil has placed him at the acknowledged head of American draughtsmen, will for the present give his professional labors solely to the pages of APPLETONS' JOURNAL.

A NIGHT SCENE ON THE HUDSON.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER IX.—MR. WARWICK MAKES AN OFFER.

AFTER that day, the Marks household saw no more of Mr. Annesley for some time. Even in the walks which Katharine regularly took with the children, they ceased to meet him, as often before; and they might have thought him absent from home, if they had not seen him occasionally ride past on his way to and from the village. Katy mourned this sudden desertion faithfully; but even for Katy's heart there proved at last to be a balm in Gilead, and it came in this way.

Between the well-cultivated fields which Mr. Marks called his own, and the stately Morton woods that stretched to meet them, and bore the Morton name for many a long mile, there lay a strip of land belonging to the latter, which, having been "thrown out" for years, had made that place dear to every child's heart—an old field where broom-straw and young pines disputed possession with blackberry-bushes and wild fruit-trees; where strawberries by bushels were to be found in spring, and sweet, delicate wild-flowers bloomed in profusion; where the boys of Tallahoma came when they wanted to arrange strictly private racing or shooting matches; where there was always a ring ready for amateur circus performers; where there was a "branch" in which minnows and crawfish abounded (not to speak of the best possible mud for mud-pies), and where the Marks children spent as much time, the whole year round, as was left at their own disposal.

One day they came home from this favorite resort full of momentous intelligence—they had made a new acquaintance. When the name of this new acquaintance was heard, the interest of the elders was scarcely inferior to that of the children; for it was Felix Gordon—the little prince, as people began to call him, on account of his proud young beauty and grand young manners.

"And he's downright jolly, mamma," cried Jack, in his vociferous way. "I thought he was a baby, you know—having a great big nurse following him about all the time; but he isn't a bit of a one. And he says he hates her; and he says she ain't going to mind him any more."

"But he's got a boy that follows him now," said Dick; "and he orders him about just as if he was a man."

"But I thought his mother kept him so close, he was never allowed to see anybody?" said Mrs. Marks. "He must have been there without her knowledge."

"He says he can go anywhere he pleases now, provided this boy goes along with him," answered Jack, whose volubility made him spokesman for the party, whether the others would or no. "He says Mr. Annesley talked his mother into 'lowing it; and he says he's going to have a pony soon as ever Mr. Annesley can find one for his mother to buy."

"And he says I may ride it!" broke in Katy, determined to have an utterance on this point at least.

"My daughter!" said her mother, reprovingly. "I hope you were not such a forward little girl as to ask him."

"Oh, no, mamma; he promised me his own self."

"Oh, did he?" cried Jack, sarcastically. "Well, I reckon he did—after you'd been hinting like forty! She told him she liked riding, mamma, and she kep' a-telling him so, till he was 'bliged to ask her. Yes, missy, you know that's so!"

"I don't," retorted the little lady, angrily.—"'Tain't so, either, mamma; he asked me his own self."

"Why didn't he ask Sara, too, then?" inquired provoking Jack. "She's a great deal prettier than you are—you stuck-up, forward thing!"

"He did ask me," said Sara's quiet little voice.—"He turned round and asked me just after he asked Katy, mamma; and just like he was a grown-up gentleman. But I told him no, I was much obliged to him, but I was afraid of horses."

"And that was what Katy ought to have told him," said Jack, looking severe reproof at Katy.

"But I ain't afraid of horses," cried she, indignantly; "and I

oughtn't to have told a story.—Mamma, he is so nice. Mayn't we please go to see him?—he asked us."

"Yes, mamma, he asked us—mayn't we?" chorussed all the rest.

But of this, Mrs. Marks would not hear. "You may go to see him, if he comes to see you," she said; "but otherwise—certainly not."

With this condition, the children were obliged to be content—trusting to their new acquaintance for its fulfilment. But their new acquaintance either would not or could not fulfil it. He met the little Marks every day in their favorite place of resort; and every day they brought home more wonderful accounts of Felix's sayings and doings; but Felix himself never appeared.

And so the Indian summer came gradually to an end; the soft, blue haze faded from the landscape; a few fierce storms tore all the bright leaves from the trees; and Winter—at least as much of winter as the fair South ever knows—was seated on his throne. His first act of power was a nipping frost, accompanied by such a "freeze" as had not been known in that region of country for a fabulous number of years—a freeze which, to the amazement of everybody, spread a sheet of ice over a small mill-pond near the town, and put all the boys of Tallahoma figuratively on their heads, and literally on their backs.

In the new field of amusement thus opened, neither Jack nor Dick were behindhand; and one day they joined in begging Miss Tresham to come and witness their prowess. "Sara and Katy want to see some skating," said the boys, who were not bad brothers as boys go; "and mamma says they can't come out to the pond, 'less you'll come too, Miss Tresham. Please, do; it's such good fun."

"Is it?" said Miss Tresham. "But it is cold fun, too, for people who don't skate. Have you got a fire out there?"

"Oh, the biggest sort," cried both boys, in a breath. "And we'll make it up splendid, if you'll come, Miss Tresham."

Miss Tresham looked doubtfully out of the window. It was certainly cold; but the boys were anxious; Katy and Sara looked unutterable things; she herself felt that she needed exercise; and, then—the wind was not blowing! That is such a great point in a climate where still cold can never be very dreadful.

"Do you want to go very badly?" she asked, with a smile, of the two little girls.

And they—who knew by that smile how their cause was won—answered, eagerly: "Oh, yes'm; oh, Miss Tresham, indeed we do!"

"Very well, then; we will walk out after dinner. And as for you"—she shook her finger at the two young skaters—"if you deceive me about the fire, I will never trust either of you again."

They made the most effusive promises, the two young scamps, who were secretly burning to be off. "Never mind, Miss Tresham, I'll see about it," said Jack, grandly. "I'll make them bring heaps of pine-knots, and they shall all be put on when you come.—But, I say, Dick, look sharp—it's time we were off."

"Off!" echoed the governess. "Are you not going to wait for dinner?"

"We can't," said both in a breath. "But Mom Judy promised to have us a basket ready, and we'll eat it on the road." (They did not mean the basket, but its contents.) "Don't change your mind, Miss Tresham—we'll look for you."

"You shall see me," answered she. "I hope you will enjoy yourselves."

They had the grace to thank her; and then were off, running down the passage, leaping down the staircase, as if the fate of a nation depended on their speed; and filling the house with that stir and clatter, that healthful noise and pervading sense of vitality, which only the presence of boys can diffuse.

After they were gone, Miss Tresham and her two young charges drew near the school-room fire, and waited for the sound of the dinner-bell. It came at last, breaking in upon the oft-told story of the "Fair One with the Golden Locks;" and they went down together, the children claiming each a hand of their young teacher, and making quite a pretty picture when they entered the dining-room.

At least, so a gentleman thought who was standing before the fire with a paper in his hand, and at sight of whom Katy burst into an exclamation.

"Why, unky! I thought you never came to dinner."

"I have come to-day, at any rate," said he. "Do you mean to say you are not glad to see me?"

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

"Oh, yes, so glad—ain't we, Sara? But, unky—" Here a sudden pause, and a tiptoe peeping into "unky's" coat-pocket.

"Well?" said he, apparently unconscious of this fact.

But Katy was too busy for speech. She had detected a brown-paper parcel in that receptacle, and she was now intent on an abstraction of the same—a design very well favored by Mr. Warwick's deep interest in politics. Then came a shout.

"Oh, Sara, look! Mamma—Miss Tresham—look!"

"French candy, I declare!" said Mrs. Marks. "John, you really ought not to be so extravagant. You ruin these children."

"Oh, mamma, it's so nice!" said Katy, with a crystallized fig in one hand, and a rose-flavored triumph of confectionery in the other.

"So nice, is it?" said her mother, severely. "And pray, where are your manners? Have you offered Miss Tresham any?—or even your uncle? No; you need not do it now" (as Katy penitently gathered up the paper in her two little hands), "I hear your father's step on the piazza, and dinner is ready.—Tom, put that candy on the mantel-piece."

"May I have it as soon as dinner's over, mamma?" asked Katy, watching, with regretful eyes, the elevation of the candy.

"Yes, you may have it; and I hope you will offer the rest of us some," said Mrs. Marks, taking her seat at the head of the table. "I am fond of candy myself.—Well, my dear, it is cold out—is it not?"

This was addressed to Mr. Marks, who, coming in from the outer world with the state of the thermometer written legibly on his nose, made straight for the fireplace.

"Cold! I should think so, indeed," he answered. "Almost cold enough to nip a man's ears. I never saw such a spell of weather but once before in my life."

"And that was not in December, I am sure," said Mr. Warwick, surrendering possession of the hearth-rug.

"No; I never saw any thing like it in December before," answered Mr. Marks, standing with his back to the fire, and critically scanning the table over his wife's head. "Our mild weather always lasts until after New-Year."

"Last Christmas we had garden roses on the dinner-table," said Katharine; "but the poor bushes are melancholy sights now. Did you notice them as you came through the garden, Mr. Warwick?"

"Yes," answered Mr. Warwick. "Your cloth-of-gold buds, especially. The frost did not spare you even one."

"Mr. Annesley'll send her some prettier flowers," remarked Katy. "He always does; and I like them better than ours."

"No doubt of that, you true daughter of Eve!" said Mr. Warwick, who had sufficient discretion to remove his eyes from Katharine's face, and transfer them to the saucy little speaker. "It would be all the same, too, if we had the japonicas, and Mr. Annesley sent the roses.—What is it, Bessie?"

"Do come to dinner," said Mrs. Marks, who had finished piling the ham before her with well-cut slices, and was at leisure to observe that the leg of mutton, at the other end of the table, had ceased to steam. "Richard, you are surely warm by this time?"

"Moderately," said Mr. Marks, as he left the fire with a regretful sigh and went round to his seat, which had two comfortable sluices of air blowing upon it from two ill-fitting windows. After his short grace was finished, and he began to carve the leg of mutton, he observed the absence of Jack and Dick.

"So those young scamps are off to the pond again!" he said. "I wonder they don't kill themselves. Everybody seems pond-crazy! All Tallahoma has gone out on a general jollification."

"We are going, too, papa," cried Katy, eagerly. "Miss Tresham is going to take us this evening."

"Is she? Well, I'm sorry for Miss Tresham, then. I know you little ones have tormented her into it."

"No," said Miss Tresham, speaking for herself, "I shall really enjoy the walk. How far is it to the pond?"

"A good two miles," said Mr. Warwick. "Rough miles, too; so I would advise thick shoes and warm wrappings."

Dinner went off in short order; and, when it was over, the children ran for their cloaks and hoods without demanding the candy, which Mrs. Marks suggested should be taken along and feasted on beside the pond.

"Wrap up your best," said Mr. Warwick, with a smile, as the young governess rose to follow. "I shall stay here to see—and ad-

miere," he added, when the door had closed on her.—"What a pretty creature she is, Bessie!"

"And as good as she is pretty," said Mrs. Marks, enthusiastically. "The children love the very ground she walks on; and, if ever I had a lucky day in my life, it was the day I met Katharine Tresham."

The table was cleared off, draped with its bright-crimson cover, and wheeled into its accustomed corner; the last plate and goblet whisked away to the pantry, the fire replenished, the hearth swept, the cheery dining-room looking the cheeriest, when Katharine came in again.

She found Mr. Warwick the only occupant of the room—Mr. Marks having gone into town, and Mrs. Marks into the kitchen. It was that important era in housekeeping known as "hog-killing time," and the lard and the sausages absorbed Mrs. Marks almost as much as the pigtales and the roasting thereof distracted the children. Katharine was not surprised to find her gone, but she was surprised to see Mr. Warwick, who looked up from his newspaper as she entered.

"Ready?" said he. "I gave you thirty minutes, and you have only taken fifteen. Well—" with an amused glance from her bonnet to her shoes—"I think you can safely defy the weather."

"I think I am ridiculously wrapped up," answered she; "but panics are infectious. You have all been talking about the cold till I deluded myself into a belief that it must be Siberia; while the truth is, that I opened my window just before I came down, and it is absolutely pleasant."

"So much the better for your walk, then. But I think you'll change your mind when you are once out-of-doors."

Just here there was a rush in the passage outside, and the two little girls flashed into the room in their warm cloaks and bright-crimson hoods. Then came an outcry.

"Why, Miss Tresham's all ready, and we don't have to wait—how nice!"

"Katy, don't forget about the candy."

"Unky, please hand me down the candy."

"Do it up tight."

"Miss Tresham, please tie this knot. I can't get my gloves off."

"You little torment!" said Miss Tresham. "How can I do it when I have my own gloves on? Ask Mr. Warwick."

"Unky, please."

"I suspect Miss Tresham could do it better with gloves than I can without," said "unky."

But he tied the knot very deftly, nevertheless; and then slipped the package into his pocket, much to the astonishment of Katy and Sara, who raised a frightened cry of expostulation.

"Unky!"

"Oh, that's Indian-gift!"

But the Indian-giver turned quietly to the governess.

"May I go along, if I promise to show you the best road, and not to promote any disturbances?"

Katharine looked surprised.

"Are you in earnest, Mr. Warwick?"

"To be sure I am in earnest," said Mr. Warwick. "I came home for the purpose of taking these little ones out; but they will enjoy your company more than mine. Only, as I don't like to break up my day for nothing, may I go, too?"

"Of course, you may.—Children, do you hear? Your uncle is going with us."

The afternoon was dazzlingly bright when they went out into it; and Mr. Warwick was soon forced to acknowledge that Katharine's judgment of the temperature was better than his own. Being bright and still, the atmosphere had softened very much, and seemed to them almost mild as they walked in the full glow of the winter sun.

"This will be the last day of skating," said Mr. Warwick. "Indeed, I doubt if the ice is safe now. I think I shall stop Jack and Dick as soon as we get there."

"Even if the ice broke, is the water deep enough to drown anybody?" asked Katharine, to whom a mill-pond did not suggest any thing much to be feared.

"It is not less than twelve or fifteen feet in depth," said her companion. "I used to swim in it when I was a boy, and I know it well—besides, the waters are very full just now. On the whole, I think those young gentlemen had better rest on their laurels."

"If there is any danger, yes, indeed. But we can't stop them now; so please don't let us talk about it and make ourselves uncomfortable."

They did not. On the contrary, they talked of other things much more agreeable. Mr. Warwick could not help feeling that many a man might have envied him his position, and that there had seldom been a lighter form or a brighter face than the one now walking beside and smiling upon him; while Katharine, for her part, had never been one of the girls who can find little or nothing to say to a man who is not young enough or foolish enough to be converted into an admirer. Indeed, these two had been friends in a certain reserved but sincere fashion ever since the young governess entered the Marks household. She was often more nearly approaching the confidential with him than with any one else; and they fell into something of a personal strain now as they walked along the rough foot-path, and troubled themselves no more about the children than just to keep their crimson hoods in sight.

"Yes, I pity you," Mr. Warwick was saying, "and all the more because you don't seem to pity yourself. If you were discontented, probably I should not trouble myself to sympathize with you. But, as it is, I think very often that you have a hard lot for such a young person."

"Many people younger than I am have a much harder one," said Katharine, quietly. "Does that never occur to you? It always does to me."

"But not people who seem so essentially born and fitted for other things."

"What sort of things do you mean?"

"I think you know. Wealth, luxury, the appliances of refinement, the power of being generous—for I think you would be generous if you had the power—and of putting your talents to some better use than their present one."

A flush came over the girl's face as he spoke, but died away before he finished.

"That is the way my own vanity speaks to me sometimes," she said; "but I never listen to such suggestions. I go and get Dick's sum, or Sara's exercise, and drum away the phantom with the rule of three or the vocative case."

"But it comes back?"

"Yes, sometimes. Then there is nothing to be done but to face it boldly, and ask myself if I am really so weak and vain as to think myself better than the millions who have toiled to their lives' ends, more humble and more unknown than I am; if better talents than any of mine have not gone down into the dust soundless; and if"—her voice sank slightly here—"I am wiser than He who orders our lives for us from their beginning even to their end."

"And then?"

"And then I think that I cannot be sufficiently grateful for all the blessings my life has known; and I try to crush down the vanity and self-love which—let us disguise it as we may, is, after all, the root of most of our discontent. We think too highly of ourselves and our own deserts. If we would only try to recognize ourselves as we really are, we should feel so ashamed of our repining that I think we would be content ever afterward to take whatever God is good enough to give us, and leave the choice of good or bad fortune to Him."

"Do you speak from experience?"

She smiled a little.

"Can't you tell that? One reads such things in books, but one only learns them in one's own heart. It seems to me it is always easy to tell whether it has been read or learned."

Mr. Warwick did not reply; and they walked on silently for some time, no sound breaking the stillness save the echo of their own tread and the children's merry tones floating back through the clear air. Just here their road was through a pine-forest; the tall, straight trunks rose on every side; the deep, sombre green stretched away far as the eye could view; the golden sunshine streamed with a mellow brightness through the stately arcades; and, although there was only a slight breeze stirring the tree-tops, the sound above their heads was like the distant murmur of the sea. It put Katharine strangely in mind of the ocean; and, together with the soft carpet of pine-straw under their feet, and the aromatic fragrance of the forest around, came back to her afterward—recalling that afternoon, and giving its events a picture-like distinctness in her memory. At last Mr. Warwick said, thoughtfully:

"It is not even as if you had been born to this sort of thing."

"But I was born to it," she answered, quickly. "All my life I knew that some day I must earn my own bread. That was the reason why my aunt—my dear, kind aunt—was so careful to educate me thoroughly. She could give me nothing besides an education."

Almost before he had time to consider the incivility of the question, Mr. Warwick had asked "Why?"

"Because she was an officer's widow, and her pension ended with her life," Katharine answered. "But, while she lived, I had a very happy time—and, after that, it did not matter."

Her voice choked, as she uttered the last words; and her companion did not need to glance at her, to know why she drew down her veil so hastily. He gave her time to recover herself, and then said, kindly:

"Courage. Remember how young you are. Happiness may come to you yet, in the form you like best."

"And what is that form?"

He shrugged his shoulders slightly, as he had a habit of doing over any knotty point of legal evidence.

"I may be mistaken, but it seems to me you would like best the happiness that could give you all those things of which you have so keen an appreciation—pictures, music, amusement, and the admiration which all women value so highly."

"I certainly like all those things," said Katharine, with a little sigh; "but I assure you, I can live without them and be happy too. No, Mr. Warwick, you have not hit upon the one great gift which Happiness must bring in her hand when she comes to me—or else not be happiness at all."

Mr. Warwick looked at her intently. Did she mean Morton Annesley's love, he wondered. If so, why did she speak of it thus frankly to him? It was not like Katharine Tresham to do so. "Tell me what it is?" he asked.

The clear, gray eyes—pure and truthful as God's noonday—met his own, as she answered, quietly: "It is the gift of peace."

After that, nothing was said for several minutes. Katy came dancing back with a spray of holly which was duly admired, and which, at her request, Katharine fastened in her brooch. Then, after she ran forward again, Mr. Warwick spoke:

"Miss Tresham, I am going to say something which may seem impertinent, but which, I trust, you will take as it is meant—in simple kindness. I have noticed, for some time past, that you have not been quite yourself, that you have grown thin, that your spirits are less even than heretofore, and that some trouble is evidently preying upon you. Is not this so?"

Katharine caught her breath, paling perceptibly. "I hoped no one had noticed it," she said.

"I am sure I may safely say that no one but myself has done so," he answered. "I am a very close observer—Nature gave me the habit, and my profession has taught me its importance—but you are a very good dissembler. The trifles in which you have betrayed yourself were light as air; but the driftwood shows the direction of the current, you know. I did not need to hear what you said a moment ago, to convince me that something is wrong with you. If it is any thing ideal, I can do nothing for you; but if it is any practical trouble, such as comes to us all sooner or later, why, I trust you believe me to be your friend."

"Yes," she said, simply; "I am glad to believe it."

"And I am glad to hear you say so; for I have watched you closely, ever since you entered my sister's house, and I have never yet known you to trifle with truth. That, first, made me like you, I think—for, of all virtues, it is at once the greatest and the rarest. If you believe me to be your friend, there is not much more to add. A woman—even a woman as brave as you are—is such a helpless creature in the world, that she is often made to suffer acutely through her weakness and her ignorance. In any emergency, therefore, I hope you will remember that my services are at your command."

"Thank you," said Katharine, lifting her face toward him, with a grateful light shining over it. "You are very kind, and there is no one to whom I would as soon go. But—" she paused a moment, and added, slowly—"I must bear my burden alone."

He turned and looked at her. The light had faded, and the young face seemed to have hardened into a self-contained power of endurance. The mouth was set, the eyes were resolute, and, as she met his glance, she repeated her words in the same tone:

"I must bear my burden alone."

"I cannot help you?"

"No. You are very good; but only He who laid it on me can take it away."

Again they walked on silently; and the lawyer felt half inclined to indulge in his quiet, cynical shrug. "It is Annesley, after all," he thought. "What a fool I was to suppose it could be any thing else—and a still greater fool to make such an offer! The very pine-trees might afford to laugh at the idea of my playing *confidant* and consoler in a love-affair!"

Then he glanced at the face beside him, and felt again a sudden conviction that it was *not* Annesley—not any cross in love, or ordinary heart-disaster—which brought such a look of suffering and resolve to those earnest eyes. An impulse hardly to be accounted for, and not at all to be analyzed, made him suddenly extend his hand, and place it on Katharine's arm.

"One word more," he said. "You are entirely unprotected by any friend or relative; this fact must excuse the request I am about to make. Will you promise to come to me if you ever stand in greater need than you do at present of service or advice?"

Katharine paused and looked at him wistfully. "Mr. Warwick," she said at last, "I cannot promise what I am never likely to perform."

"You mean—?"

"I mean what I said before—that I can only carry my burden to God, and He only can release me from it."

The keen lawyer-glance regarded her earnestly—searching, perhaps, for some shadow of shame or fear—but it only found a steady dignity on the pale face, and an open candor in the eyes that looked brave enough to face death itself unflinchingly.

"You are strong—for a woman," he said, after a while; "but your hour of weakness may come. I hope you will remember, then, that my offer still holds good."

"Yes," she answered, quietly, "I will remember it with gratitude."

There was nothing more to be said. They resumed their walk, and, after a minute, fell into other topics—talking until they caught a glimpse of frozen water shining through the trees, and Katy called out, joyfully:

"Here we are! here's the pond!"

"Here is the pond, certainly; but here are not the skaters," said Mr. Warwick, glancing over the sheet of water which lay all silent and glittering before them. "They must be lower down—ah! yes, I see them now. This way, Miss Tresham."

He led the way around a small headland, for the outline of the pond was very irregular, and a picturesque scene burst suddenly upon them—a scene vivid with color, and bright with animated motion, set in the midst of the winter landscape. This portion of the pond was alive with skaters in every stage of proficiency and non-proficiency. One or two seemed at home on their skates, a few managed to keep their feet and move with a tolerable degree of ease; but the vast majority were hopelessly sliding about, and ignominiously falling down every other minute, to their own discomfort and the immense amusement of the spectators on the shore. These spectators were not by any means contemptible in point of numbers, for three large fires were blazing as only lightwood can blaze, and grouped around and about each were knots of young people, children, and servants. In the background stood several empty carriages, and quite a goodly array of horses. Camp-stools and baskets abounded, bright shawls were laid over the roots of trees to form impromptu easy-chairs, gay scarfs and hoods dangled from the boughs, the golden sunshine streamed over all with a glory and beauty entirely its own, and the majestic forest stretched around in its solemn grandeur.

Katy and Sara darted forward, while Miss Tresham and Mr. Warwick followed more slowly toward the nearest fire. As they approached, two ladies and two gentlemen, who were standing directly in front of it, drew back, and Katharine found herself facing Mrs. French, Miss Vernon, Mr. Annesley, and a stranger whom she had never seen. Neither of the ladies noticed her, excepting by a stare—well-bred on Miss Vernon's part, ill-bred on Mrs. French's—but Morton bowed as if to a *grande dame*, and the other gentleman gave a glance of the most undisguised admiration.

"What a pretty woman, Annesley!" Katharine heard him say, after she had passed. "It can't possibly be one of the Tallahoma belles."

Annesley's reply was inaudible; but its tenor was easily to be surmised, from the long "Whew!" which was his companion's comment, and which, evidently, would not have been the only one if Mrs. French had not broken in.

"Quite a nice person, too, I have heard—that is, for her position. She has something of good style about her, don't you think so, Irene? I wonder where she got that pelisse—the cut of it is excellent. But look at the fur on it—real sable, my dear, as sure as you live. What very bad taste—for her!"

"Why for her, Adela?" asked the bluff, frank tones that were certainly not Morton's. "Why shouldn't she wear a pretty thing as well as other women? I suspect she needs all the consolation that pelisses and furs can give her."

"Don't talk so loud, Frank, and don't be so silly," was the unceremonious reply. "People ought to dress according to their rank in life, or else what's the good of there being ranks in life? For my part, when I see anybody dressed so absurdly, I feel as if I never wanted to put on a handsome thing again."

"I wish you would stay of that mind," laughed the gentleman. And Katharine felt certain that he was the legal possessor of all Mrs. French's pretty toilets, and all Mrs. French's long bills!

"Shall we go over to the next fire?" asked Mr. Warwick, whose face looked amused and contemptuous both at once. "I think it is better than this."

Katharine assented, and they moved away, just as Miss Vernon's clear tones sounded with quite a bell-like distinctness.

"I think a pretty woman has a right to adorn her beauty to the utmost of her power, wherever she may be placed. That is one right of the sex for which I shall always be an advocate, Adela."

"But the working-classes, Irene—"

"We are not speaking of the working-classes," interrupted the other, with a very cool disdain in her voice. "We are speaking of a member of a liberal profession, I thought. I hear that Miss Tresham is very charming, and for a long time I have had a fancy to know her.—Mr. Annesley, you are a friend of hers; will you introduce me?"

"With pleasure, Miss Vernon," said Morton, coloring quickly. "I shall be very glad to do so, if you are in earnest."

"Of course I am in earnest.—Adela, won't you come also?"

"I?" Mrs. French drew back in astonishment. "Irene, you are surely jesting—you are surely not going to be introduced to Mrs. Marks's governess?"

"You will see," said Irene, with a slight nod and a merry laugh. "Carry her to the carriage if she faints, Frank.—Mr. Annesley, may I take your arm?"

CHAPTER X.—THE GORDON PLAID.

The latter part of this conversation Katharine had not heard. She had moved away to the other fire, and was talking to Mr. Warwick about Jack's skating. So her surprise was entirely unaffected when Annesley's voice spoke her name, and, turning, she saw him standing close beside her, with a beautiful, golden-haired vision leaning on his arm.

"Miss Tresham," he said, hurriedly, "allow me to present Miss Vernon. She is anxious to make your acquaintance, and—"

"Hopes you do not object to having it taken by storm," interrupted Miss Vernon, offering her hand. "You must excuse me, if this is an unceremonious proceeding, Miss Tresham; but I am very anxious to know you, and I hope you do not object to knowing me."

It would have been hard to do so under the influence of that gracious smile—for Irene Vernon could be very gracious when she chose—and Katharine answered, with her usual simplicity of word and tone:

"You do me too much honor, Miss Vernon. I am very glad to know you."

"Are you?" asked Miss Vernon. "Is not that speech a mere effort of courtesy?"

"It may be an effort of courtesy," answered Katharine, smiling; "but it is true, also."

"Then I may congratulate myself upon making a favorable impression for once in my life," said the young lady. "People don't usually like me when they first know me; in fact, some of them don't ever like me at all."

"Don't they?" said Katharine, amused at this frank confession. "That is strange; for I should think you would always be liked."

"Are you always liked?"

"Well—really, I don't know. But I think I am rather popular—at least with these." And she laid her hand on Katy's curly head.

"Their good-will is not worth much," said Miss Vernon, carelessly. "It is so cheap—a few sugar-plums will buy it."

"And won't different sugar-plums buy the good-will of older people just as easily?" asked Morton, abruptly.

"So you have turned cynic!" said Miss Vernon, glancing round at him. "I thought you left that to me."

"Don't slander my favorite objects of trust, then," answered he, laughing. "I must believe in children, or in nobody.—Katy, don't you mean to come and kiss me?"

While Katy, nowise loath, went to bestow this favor, Miss Vernon turned with a shrug to her new acquaintance.

"I wonder if he thinks that child would like him if he were poor and ugly?"

"She likes me," said Katharine, smiling, "and I am neither rich nor beautiful."

"You are lovable, though, and that is better than either," said Miss Vernon, with a slight sigh.

Katharine looked up in surprise; but, before she could answer this unexpected compliment, the young lady had turned to Mr. Warwick, and was asking him if he meant to skate.

"I?" he said, laughing. "What have I done, Miss Vernon, that you should suspect me of such an indiscretion?"

"You have worn a pair of skates, Mr. Warwick; for I heard Mrs. Raynor say this morning that John Warwick—isn't your name John?—was the only person she ever saw who seemed at home on the ice."

"Twenty-five years ago, the compliment may have been merited; but I hardly think I need blush for it now."

"Have you forgotten how to skate?"

"I don't know. I have not attempted it since I was a boy."

"Ah, pray try!" said the young lady, with the air of one who was not accustomed to ask favors in vain. "I never saw skating before, and I am so anxious to see at least one good skater!"

"You would see a very poor one, if I were so foolish as to expose my awkwardness," said Mr. Warwick, smiling.

"Who can skate, then? None of those people out yonder can, unless skating is a very ugly thing."

"Annesley ought to," said Mr. Warwick, glancing at that gentleman, who had drawn near and was talking to Katharine. "He spent four years at a German university, and they learn skating as well as metaphysics there."

Miss Vernon turned to Morton, as if intending to speak, and then as hastily turned back again.

"He would not thank us for disturbing him now," she said. "Look at those people out yonder, and tell me who you think gives most promise of learning to skate."

Her companion looked as she directed, and at once singled out a child with floating, blond curls and a plaid scarf, the fringed ends of which fluttered in the wind as he skimmed along the ice.

"I cannot tell from here who it is, but there is no one else to compare with him," answered Mr. Warwick. "He skates as if he had been born in Russia."

"And don't you know who he is?" cried his companion, eagerly. "Why, I thought everybody knew him! That is the little Gordon—don't you see? He looks as if he might have been born in the purple."

Mr. Warwick said, "Indeed!" And then they both watched the elfin skater, who only a few minutes before had made his appearance on the ice. He was, indeed, without peer; the very spirit of grace seemed to animate his motions, and his skating was such as is never seen out of a northern latitude, and of which the inhabitants of southern latitudes can form, at best, but a faint conception. The lithe young figure was so slenderly fashioned, and every movement of every limb was so harmonious with the spirit of the whole, that, aided by the floating curls and waving scarf, it almost looked as if the wind wafted him over the ice. He soon became fully aware of his own skill, and began to indulge in vagaries quite impossible to the novice in this slippery amusement. He made wide circles, then swooped suddenly upon some knot of inexperienced amateurs, scattering them to the right and left out of his path, and generally leaving two or

three prostrate behind him; he seized the hand of some unlucky trembler, and carried him forward at a rate which soon left him breathless in a waste of ice, with no hope of return, his malicious guide having taken flight to another quarter; he snatched some half-dozen hats, and made for the centre of the pond, scattering them broadcast on his way; he indulged in solitary waltzes and ballet-like *pirouettes*; he played a thousand antics for his own amusement and that of the many eyes watching him; and then he suddenly darted away down the pond.

"Oh, I hope he is not going out of sight!" said Miss Vernon, with a very genuine tone of regret. "I never saw any thing more beautiful. Do, somebody, make him come back. Mr. Annesley, I believe he is under your charge—please speak to him."

"Speak—to whom?" asked Mr. Annesley, turning. "I beg your pardon, Miss Vernon, but I did not hear—has Felix been doing any thing?"

Miss Vernon replied by pointing to the slender figure and floating scarf which were already vanishing round the headland. "You are the only person whom he has not been entertaining," she said.

"Good Heavens!" cried Annesley, "and I promised his mother that he should not venture on the ice! How could I have been so careless!—Felix, come back! Felix!—don't you hear?"

Felix paused a moment, as the clear voice came ringing over the ice; showed that he heard, by waving his hand with a gesture of gay defiance, and then showed that he did not mean to heed, by coolly continuing his onward course. In another moment he had vanished from sight around the jutting point of land.

Miss Vernon laughed—she evidently sympathized with the bravery of this open rebellion—while Mrs. French, who was standing by, shrugged her shoulders significantly.

"People can't manage to conduct a flirtation and take care of a child at the same time," she said to her husband, in a tone sufficiently audible for Morton to hear.

But Morton took no notice of the remark. He only turned round to the by-standers, and asked if anybody could lend him a pair of skates.

Unfortunately, nobody was able to do so. Skates were very scarce articles, and whoever was so fortunate as to own a pair, lent them to his friends by turns—an arrangement which resulted in the temporary possessor being worried out of all his enjoyment by two or three impatient candidates who wanted to know "if he meant to keep agoing all day, or if he didn't mean to give anybody else a chance to do some skating?" Therefore, all shook their heads when Morton made his request, and several voices replied that Tom Jones had a pair of skates, but that Frank Smith was using them.

"What do you want to do, Mr. Annesley?" Katharine asked.

"I want to go after the little scamp," Annesley replied. "I ought to have paid more attention to him; but how could I think of his playing me such a trick, when he knew, too, that only my persuasion induced his mother to let him come?"

"This is very ungrateful conduct, then."

"Is it not?—Katy, run yonder to that knoll, and see if he is coming back."

Katy obeyed, bounding up on the rising ground at the headland, where a stately group of young pines stood like sentinels; and, in a few minutes, returned with the intelligence that he was coming back.

"You will not need to go, after all," said Miss Vernon to Annesley.

"That remains to be seen," he answered. "I don't much think he will come to shore of his own accord.—Thank you, Price." This to a young man who handed him a pair of skates over two or three intervening shoulders. Then, while he sat down to buckle them on, Felix came bearing back into sight—a more beautiful picture than ever, all alone in his childish grace on the glittering expanse of ice.

"Oh, the little darling!" cried several enthusiastic young ladies; while the boys of all ages stared in open-mouthed, admiring wonder of his skill.

"Is he coming to shore?" asked Morton, who could not see, partly because he was sitting on the ground, and partly because several people were standing before him. Two or three voices answered the question—not very satisfactorily.

"I think so."

"No, he isn't."

"There he goes—he's off again."

"That's splendid! That is skating!"

"He's bound up the pond this time."

"Yes," said Katharine, to whom Morton looked inquiringly. "He certainly has no intention of coming to the shore. He is going up the pond at a rapid rate."

"It's a pity somebody can't make him come back," said a man's voice near. "All skating is something of a risk to-day; but the ice is very unsafe in that direction."

"Are you sure of that, Mr. Mills?" asked Morton, starting to his feet.

"Very sure, sir," answered Mr. Mills, gravely. "My wagon was sailing ice from there this morning, and I don't think it would have borne the weight of a man then."

Morton made no answer, but Katharine saw that he changed color, and immediately swung himself down the bank, which happened to be quite high just there. The next minute he was gliding over the ice with a swift, steady ease of movement which proved his own proficiency quite equal to that of Felix. A chorus of admiration followed him; but the young man evidently heard none of it. He was bending every nerve in pursuit of the gay little will-o'-the-wisp who floated forward all the faster when he perceived that a chase had been instituted. Away went the two figures up the pond, the pursuer steadily gaining on the pursued, and both nearing fast the dangerous ice of which Mr. Mills had spoken. Once Annesley paused and uttered something half-warning, half-command; but the young insurgent paid no attention to it, and the only result was that it lost Morton several yards of distance. When he started again, however, he seemed scarcely to touch the ice, and the interest of the spectators had reached a very exciting point when a cry of mingled dismay and triumph rose from a knot of boys on the water's edge.

"He's got him!"

"No, he hasn't!"

"Hurrah! He's slipped away!"

"Well done, little one!"

And Katharine looked in time to see Felix dart out of the grasp Morton laid on him, and, shooting under the outstretched arm, skate away faster than ever, leaving only his scarf as trophy in the disappointed captor's hands.

"Well done, indeed!" cried Miss Vernon, with a ringing laugh of enjoyment. "I am so glad he got away. I should be so sorry if it ended. It is better than horse-racing, and I adore that! Who will make a bet?—Adela, will you?"

"Certainly not," replied Mrs. French, severely. "I think it is disgusting. Morton ought to have more dignity than to make such an exhibition of himself. I really think—"

But Miss Vernon was already speaking to Katharine.

"Miss Tresham, will you? As many pairs of gloves as you please on the Gordon plaid."

"Do you mean Mr. Annesley?" asked Katharine, laughing. "He has the Gordon plaid at present."

"No, indeed; I mean on the rightful owner of the Gordon plaid. Bless his brave little heart! Where is he now?"

"Yonder he is," said Mr. Warwick, who was standing by, a quiet and much-interested spectator. "But Annesley is gaining very fast upon him; so perhaps you had better not register your bet just at present. See! he almost laid hold of him. There, now he has doubled again. After all, you may—my God!"

A sudden wild cry from Mrs. French—a murmur of horror from the crowd—and out on the ice, where there had been two figures a moment before, only one.

This was a terror-stricken child, while, where the ice had broken through, there still floated one fringed end of the Gordon plaid. On the shore, a rush, a commotion, a sound of many voices, and a lady in violent hysterics.

Katharine never knew much of what ensued. She heard Mr. Warwick's tones take the lead, and bring some quiet out of the uproar; she saw a confused mass of men and boys dash across the ice with a reckless disregard of danger, and she sat down sick and shuddering to await the result.

Miss Vernon sat down by her. Neither said anything, yet there is no doubt that each was conscious of the presence of the other. Mr. French, meanwhile, had left his wife to get out of her hysterics as best she could, and had gone to the rescue with the rest; so, finding

nobody to take any notice of her, she somewhat subsided, and stood sobbing and asking questions which it was impossible for any one to answer yet.

To those watchers on the shore it seemed hours, but it was in reality only a short time before the many strong arms which broke up the ice and buffeted the water so bravely gained their reward—before they raised to the surface and bore shoreward, with a rush of triumph, that which seemed so awfully still and white when they laid it down at Katharine Tresham's feet.

They said it was not Death, but she could scarcely believe it was Life, when she looked at the pale face with the wet hair clinging round it, and at those rigid hands which still grasped the silken scarf.

But, even while she looked, there came a long, gurgling sigh through the half-parted lips—the lids slowly lifted—the dark eyes gazed up at her pitying countenance as if in a bewildered dream—and her name was spoken with that tender, yearning accent which would make any name of earth beautiful.

"Katharine!"

Then, before she could utter one word, they closed again, and Mr. Warwick said:

"He has fainted!"

A little while later, after Mr. Annesley was sufficiently recovered to thank his rescuers, to answer all the inquiries of his friends, to enter his carriage, and be driven home, Mr. Warwick came up to Katharine, and asked her if she felt inclined to perform a deed of charity.

"It depends a good deal upon the amount of exertion required," she answered, with a smile. "I am a little tired. But let me hear what it is."

He pointed to Felix, who stood at a little distance the centre of an admiring group, and quite as nonchalant as ever.

"I promised Morton to take that young gentleman home, and to give as mild a rendering of his exploit as is at all consistent with truth. But I begin to doubt my diplomatic ability. I think you could do him more service than I; and, in short, I want you to take the matter off my hands. Will you?"

Katharine looked slightly aghast.

"Mr. Warwick, I would be glad to oblige you, but—but I am a mere stranger—and *Morton House*!"

"That is the very reason why I ask you," said Mr. Warwick, coolly. "Considering all things, I think a mere stranger might be more welcome in Morton House than an old acquaintance like myself. Will you go?"

She hesitated a minute longer. Then, remembering what might be his reason for wishing to avoid Mrs. Gordon, answered quickly:

"Yes, if you think I can do any good, I will go."

"If you cannot, I am sure it will be for the first time," he answered, smiling. "Yonder comes the carriage which Annesley promised to send back, so you see you have no time to change your mind. Let me put you in, and see you off. Then I will take the children home."

He put her in, called Felix and presented him, closed the door, watched them drive away, and never thought, until long afterward, that he was the direct means of first bringing Katharine Tresham under the roof of Morton House.

[TO BE CONTINUED.]

THE DUCHESS DE BERRI.

FROM THE GERMAN OF GEORGE HILTL.

THE sun struggled vainly through the rising vapors of a misty summer morning, and the sky wore that dull-red tint which always foretells intense heat.

Peasants in their *sabots* hurried along the road from Paimboeuf to Nantes, in the more endurable early hours, thus trying to avoid the later heat so surely foretold.

Men, women, and children, gayly travelled onward, but among the laughing, merry crowd were two young girls, who seemed to give more than careless glances to the passing throng.

They wore the costume of the country, consisting of a wool-len petticoat, high blue apron, and jacket with loose sleeves.

But even a passing look at the graceful contour, delicate hands, and small feet of the young women, showed them to be very different from their companions. And, though even the sabots were not wanting to complete their costume, yet despite their efforts to appear accustomed to them, one could easily perceive that the girls were not used to walk in such clogs.

"Stella"—at last one of them softly said—"I cannot walk; these clumps on my feet hinder me;" and, without waiting for a reply, she sat on a little mound near by, and pulled off her heavy shoes and coarse stockings.

"Do you intend to walk barefooted?" inquired her companion.

"Certainly, for I have known worse roads," she answered, sadly, "and they have not given me an easy life, I assure you."

Then both walked on in silence for some time, though they heard many a rude word and gay jest spoken at their expense.

At last an old man laughingly said, "Well, I will swear that yonder girl never worked much in the field—for just look at her feet!"

"Silver-foot—silver-foot!" shouted the young men in chorus.

"God help us—we have betrayed ourselves!" said the one to whom the words were addressed.

"I fear that we are in some trouble," replied her companion, "for no peasant ever owned such white feet."

"That is true—but come with me," said the girl, and she walked swiftly to the river-bank, where she grimed her feet with mud.

"They will think them sunburnt," she added, as she again commenced her journey.

Thus the day wore on, the heat steadily increasing, and several miles yet to traverse ere Nantes is reached. But our peasants bravely trudge on, for no clumsy sabots impede their light, graceful steps. They laugh and chat with the women, for they are interested in the talk of the crowd. To-day is the great fair in the city, and, as the distant spires appear, the throng grows denser; and here the girl shrinks again, for about this part of the road the pavement commences, and the sharp stones hurt her bare little feet.

Then she sits down, and once more puts on the woollen stockings and heavy shoes. An old peasant-woman, seeing her, cried:

"Look! that's a smart girl! And, see, Fanchon," she said, turning to her daughter, "the good child wanted to save her shoes and stockings, so she walked without them, and now, before entering the city, she puts them on again.—You have done well, child!" and the old woman smiled approvingly.

The girl laughed as she met her companion's eyes, and they both walked on.

As they approach the bridge, they hear the sound of drums, and a detachment of infantry comes from the city. An officer on horseback, surrounded by a brilliant staff, leads the troops, and, as he glances around, suddenly reins in his horse, for he remarks the girls.

Again he observes them, and not with the careless tribute to beauty—for his face is stern, as he shakes his head, and spurs on his steed, never once looking back.

One of the girls pauses here, for she has met that gaze with daring, defying eyes that seemed to say:

"Here I am; arrest me if you are brave enough!"

But, when the officer passed, she breathed a long sigh of relief, and whispered to her companion: "He has recognized me, but did not betray me—I will not forget it." Then she crossed the bridge—but what can it mean?—for here are sentinels at the gate, patrols in the streets, soldiers at the end of the bridge!

"Come, children!" calls an old woman, tugging at a heavy basket of apples. "Here, lend me a hand!"

The two girls help her to raise the basket to her shoulder.

"Well, mother," said one, "I think that you might at least give us two apples!"

The old woman gave to each an apple. "Oh! how refreshing after this long walk!" said one, as she bit the nice fruit.

She was standing inside the gate, and, as she looked up, saw a large placard: "État de Siège!" is written in huge letters, and now they know that martial law is declared in Nantes—therefore the sentinels, the soldiers, and the oppressive quiet.

"For my sake," said one of the girls, with tears in her eyes, "for the sake of the oppressed, do not stop here."

Vendée, Maine, Loire, and Deux-sevres, are under martial law.

She looks up at the placard, and frowns.

Again her companion entreats her to leave. "Every moment you are in danger!" she urged; but the girl will not stir till she has read the proclamation to the end.

Then she puts her hand in her companion's arm, and goes bravely on—on through the streets and by-ways till they reach the "Haute du Château."

A solitary house at last ends their journey; they ring the bell, the door opens, and they enter the hall.

Two ladies and several gentlemen meet them—the ladies kneel as they murmur: "May God bless your advent! We are happy to welcome your royal highness here."

Then Marie Caroline, Duchess de Berri, extends her hands to raise her friends, and, after embracing them, proceeds with her faithful companion of the morning, Stella of Kersabiec, to a comfortable chamber prepared for her reception. At last she is rescued—saved! For the peasant who trod the dusty road, through all the scorching heat of that morning, was the wife of that idolized Duc de Berri, who was cruelly slain by Louvel in the lobby of the Grand Opera. The life of the duchess was now completely changed, for the excitement of continued danger gave place to the peace and rest most refreshing to her.

The house was stanch and comfortable, and, though simple, appeared homelike to the poor, tired wanderer. High windows looked down upon the castle gardens, and in the distance the shining Loire wound through rich meadows.

Among the rooms appropriated to the duchess, was one on the third floor, which seemed especially intended for those in trouble. This little apartment was literally only an attic closet; but its location and construction marked it as a resort in times of danger. And this had in reality been its glorious use in 1793, when the butcher Carrier held his bloody rule in Nantes.

The chimney of this small room formed, or rather compassed, an interior apartment, which was separated from the little chamber by an iron mantel. This mantel could be pushed aside by means of a spring, which also closed it; and, concealing the chimney-piece still more successfully, hung a curtain which apparently fell only in front of rubbish.

The inner apartment was five feet square, admitting neither air nor light, and, as it was known to but few, would afford safety in time of danger.

During her residence here, Marie Caroline was not idle; for she felt the necessity of continued exertion. Her correspondence with the legitimists was very extensive, and she looked with longing eyes to a great European war.

Antwerp might possibly become the apple of discord, and in imagination she saw the enemies of France approach her frontiers. Enthusiastic Vendéans and Bretons surrounded her, waving the white banner and defeating her foes.

For this dream she toiled incessantly, and nine hundred letters to all parts of Europe, written by her own hand, attest her tireless energy. She used twenty-five different ciphers, and the white ink with which she wrote hurt her eyes. Though obliged to remain a prisoner in her asylum, yet in thought she was everywhere, for her active mind chafed at the inactivity to which she was condemned. Love for her son inspired her with strength, nerving every effort; for, despite her apparent security, she frequently felt an anxiety that amounted almost to presentiment. At such times she would leave her own apartments, and seek her kind, faithful friends, the ladies Duguigney; but, even when among them, the slightest noise alarmed her, and the mere approach of soldiers made her fear attack. But at length she felt that her enemies must be tired of persecuting her, for the last smouldering of domestic strife had been extinguished in La Vendée, the last of the revolutionists had been quelled, and the troops of the government were now in possession of all suspected places. The ministry were, however, still watchful, for they looked to the future.

Notwithstanding the strictest search, the police had lost track of the royal fugitive, and she could not in any way be traced. In France she certainly was, perhaps even in La Vendée. The Paris detectives suspected that she was in Nantes; but here she eluded their endeavors, and they were puzzled what to do. At this time Maurice Duval was talked of as Prefect of Nantes, and a man called on him, offering his services. This person had been sent on a secret mission to Portugal, and his name was Simon Deutz. Born a Jew, he had materially injured himself by abjuring the old faith of his fathers at Rome, be-

cause the change seemed only impelled by selfish motives. Cappelletti was his patron at this period, and, as this Italian looked forward to the chair of St. Peter, Deutz felt that as a Catholic his future was assured.

At Turin, on his way to Rome, he made the acquaintance of De Cady, by whom he was invited to Massa, and there, in February, 1832, was this adventurer presented to the Duchess de Berri. Fatal acquaintance!

At this time Deutz was also introduced to the principal legitimists—Bourmond, Mesnard, Saint-Priest, and Kergolay. Seeming to favor their cause, he became an enthusiastic admirer of the duchess, and was at once admitted to her confidence. Also without means, and appearing to need assistance, the duchess sold a costly ring in order to help him, for she had no ready cash. Receiving six thousand livres for this jewel, she at once placed the money at his disposal, and, accepting the princely alms, Deutz embarked for Spain.

M. de Montalivet's private office is on the first floor of the Department of the Interior. He has finished his daily work, and is reading from the *Moniteur* the usual articles in favor of the administration, when he is interrupted by the entrance of a servant, who hands him a card.

"Show the gentleman in," said Montalivet.

And a man in black entered. His face was gloomy and repulsive, and his manner so painfully shy that his friends in Massa liked to excuse his embarrassment by attributing it to the awkwardness of the scholar. But Montalivet did not trouble himself about such trifles, if the person could be made useful; so he drew a chair for the stranger, saying:

"You have already spoken to M. Duval, and written to me, M. Deutz."

"I prefer to treat with ministers, your excellency, and not with former excise-officers."

The minister bowed.

"This is quite natural; but what can you do for us?"

"Did you receive my letter?"

"I did. But you speak very generally of the plans of the legitimists, and also of the necessity of preserving France from the horrors of civil war. All this is very fine; but it has been repeated so often!"

"Hem!" said Deutz. "Do you not think that I know a great deal about the plans of the legitimists?"

"Of course, you were at the court at Massa. You have been sent to Dom Miguel to conclude a loan for the party of the young prince."

Deutz appeared perfectly unconcerned.

"Therefore, I know every thing," he said. "I know la Berri very well."

Montalivet started.

"How—" he exclaimed.

"Excellency," interrupted Deutz, "do not hesitate with me, for I intend to deliver the duchess into your hands."

Montalivet jumped from his chair.

"How—you?"

"I intend to deliver the duchess into your hands," repeated Deutz.

Montalivet now grew more controlled and communicative, and after half an hour's conversation Deutz obtained his entire confidence. The minister then thought the whole affair settled; but he reckoned without his host, for his associates, even including the king, were not inclined to consent to the arrest of the duchess. Would not such an act cause great embarrassment?

The rebellion was suppressed; therefore, what could they do with her? If she were not tried, they would be exposed to the most odious suspicions and attacks. Then, again, before what court could she be arraigned? Of whom must it be composed? Of the peers of France. The widow of the man whom France adored before the same court that had condemned his murderer, Louvel!

If brought before a jury, what then? Legitimists would acquit, republicans condemn. How was the government to act? Both alternatives were perplexing; therefore it was better for her to remain where she was till a more favorable occasion presented itself.

That opportunity soon arrived. On the 11th of October the ministry was changed, and Thiers, who replaced Montalivet, was very desirous of arranging the interior affairs of the kingdom satisfactorily,

for the foreign relations of France were most threatening on account of the siege of Antwerp.

There was some danger of a second restoration rising from behind the walls of that fortress defended by Chassé; and, if the Dutch were victors, then Marie Caroline might leave her retreat, and wave again the red torch of war.

Thiers felt that he had a mission to accomplish, and it was the arrest of this woman. He therefore sought to reopen communications with Deutz; but the latter was unwilling to treat with Thiers, whose manners were decidedly less agreeable to him than those of Montalivet.

But the ex-minister was generous, and he brought Deutz in his own carriage to Thiers.

The next step was to give Duval the prefecture of Nantes. Deutz followed him under the name of Monsieur Hyacinthe, accompanied by the detective Joly, invested with full power from the minister. Thiers was shrewd, and wisely concluded that if a man could renounce his religion from selfish motives, and could betray his benefactress for a consideration, of course he required the closest attention, for such a person was quite capable of cheating a minister; therefore Joly was constituted his shadow.

A dark night settled over Nantes; the streets were deserted, and quiet reigned, excepting when the cry of the sentinel echoed in the distance.

The drawing-room on the first floor in the rue Haute du Château was prepared for visitors. Two large lamps burned on the table, and a cheerful fire crackled in the chimney. The curtains were drawn, the shutters closed, and a pleasant warmth pervaded the room. But two persons occupied this apartment, and these were the Duchess de Berri and Count Mesnard. They were conversing in an animated tone, when the clock upon the mantel struck. The duchess started at the sound. "This is the hour," she said; "will he deceive us?"

"Indeed, I do not think an interview prudent—for, what Bourmond objects, I subscribe. It is not at all impossible for an agent of Maurice Duval to assume the name of our friend Deutz, and thus gain access to your presence."

"I am sure," said Marie Caroline, "that we have used every precaution, for I am dressed as though I had just arrived from a journey; therefore the feigned Deutz will not suspect that here is my refuge. Besides, I intend to step behind yonder screen when the stranger enters, and I shall expect you to receive him. If we discover that he is not Deutz, then I will not appear; but you can speak to him alone."

At that moment the door-bell rung. "It is he!" they whispered.

Steps were now heard in the adjoining room, and the duchess had barely time to conceal herself, when Simon Deutz entered.

Count Mesnard received him, saying: "It is indeed yourself, Deutz—and my fears were groundless."

"Did you really fear?"

"Certainly; for, could not a traitor use your name? In fact, I did not think it impossible for the letters to be stolen."

Deutz smiled. "Experience has made you suspicious, and I cannot blame you."

At this moment a noise was heard behind the screen, and the duchess approached.

"Here I am, dear Deutz," she said, giving him her hand.

The traitor could not conceal his embarrassment, and visibly trembled as he held her hand within his own. Then her frank, kindly voice pierced his heart, and, traitor as he was, he hesitated. His brain reeled, and he turned to a chair for support.

"Sit down," she said, pitying his agitation—"sit down, my friend, and recover yourself; for this interview marks indeed a solemn hour for all."

Deutz soon regained his self-control, and, once more himself, felt that the greatest coolness was required.

In one particular he had failed, and this was in learning whether the duchess had provided herself with a place of concealment.

"Go first," she said to him, "for I must wait some moments before I leave the house, or we might be seen together."

With these words she ended the interview, and Deutz was forced to leave; so he kissed her hand and departed.

But he did not go very far from the house, for he wished to be

sure of her exit; therefore he loitered within the shadows of the opposite building.

She did not appear, and he was puzzled. Had she slipped out by a back door, or was she still in the house?—But time sped, and Deutz walked away, for Duval was eagerly awaiting his news.

The 6th of November arrived, and Deutz again wended his way to the street "*Haute du Château*." His step is hurried, and he looks neither to the right nor to the left, but directly toward the house, which marks his grand aim. He trembles lest some mischance may deprive him of his prey. For days he has lived in an excitement so feverish, that the hope of success has made him imprudent.

"In a week they will speak much of me," he boasted at his *table d'hôte*.

The day before, two letters from the duchess came to him, and these formed a good pretext for his present visit. This time he is shown into a small room, where he finds the duchess alone.

She sits in a *fauteuil*, and Deutz stands before her. He tries to appear unconcerned, as he leans on the back of a chair, and, taking the letters from his pocket, hands them to her, saying:

"Here are letters for your highness."

The duchess took them in silence, and opened one—no writing was visible. Then she went to a shelf, upon which several small phials were standing, and, unclosing one, wets the paper with a small sponge attached to the cork. The writing immediately appears, and Deutz involuntarily asks, "A secret letter—?"

"No secret from you, my friend," she replies; "it is only an account of money, sent me from Spain; but, it is very long—look!" And the more she dampened the paper, the more characters came to light. Then she opened the second letter, and, by the same assistance, made it legible. This was short, and, as she read, Deutz observed her countenance change. He grew anxious—what did that letter contain?—At length she dropped it, and, looking steadily at him, said:

"My friend, in this letter I am warned against a man who possesses my entire confidence. Are you that traitor?"

A pause followed. Deutz was agonized!

If her friends were near—if they had received a hint, he would not be allowed to leave the house alive.

"Madame," he replied, forcing a smile upon his quivering lips, "the suspicion does not wound me, for you surely jest. Is it possible for Simon Deutz to betray Marie Caroline?"

Again the duchess paused for reflection. Deutz looked toward the door, when suddenly she threw the letter upon her writing-table, exclaiming:

"This is all folly!"

Once more he breathed freely, for he felt that his victim was safe.

For almost an hour the interview was prolonged, and during this time the traitor endured torture. Every sound made him tremble, as he continually feared some evil mischance.

The duchess had adherents, and moments now seemed hours; for how easily might his whole scheme fail!

At last she rose, and said:

"We shall not meet again in this house." Then, giving her hand to her faithless friend, she added: "Farewell! Return to your post, and remember that the first gun near the Scheldt shall be the signal of our triumph."

She disappeared in the next room, and Deutz, descending the stairs, passed through the hall.

All was quiet in the house, and he had still a few moments left, so he quickly glanced through a half-open door. Here was the parlor where he was first received, and now he was careful to observe every thing. He saw a table laid for seven, and knew that the Misses Duguigney lived alone in the house. If the covers were for seven, then the duchess would be among the guests. Was it possible for her to be concealed in the house?

But, if Duval's police arrived at the right moment, they could seize the long-hoped-for prey at the table of her hostess, and thus easily secure her.

Full and clear the moon rose in a cloudless sky, and noiselessly the spy travelled through the deserted streets, his shadow gliding over the ground and along the walls in spectral ghostliness.

He soon arrived at the prefecture, where Duval at once received

him, for, after that first meeting, Deutz had always found him attentive and quiet as a well-trained hound.

"Quick! quick! We have her! She is at Duguigney's. Hasten!"

Instantly the prefecture was all excitement, for since daybreak the troops had orders to hold themselves in readiness for any emergency. In fact, police and military had united to arrest *one woman*!

Twelve hundred infantry had been ready for twenty-four hours, because the government feared a revolt in the event of her arrest, and these could only surround half a quarter of the town.

The residence of the duchess at Duguigney's was entirely ignored for might she not escape into one of the neighboring houses? Orders are now issued from the prefecture, and Duval goes to the commanding officer to ask his assistance. D'Erlon frowns at the request, but his duty is imperative; therefore, he orders General Dermoncourt to undertake the unpleasant task. Simon Laurrière, commandant of Nantes, is the third soldier forced into the service.

And Deutz! Where is Deutz the traitor?

Duval had locked him in a remote apartment with an officer of the police as companion. It was not wise to trust him now, but he must be held as hostage for his report. He hears the noise, listens to orders—but what will happen if Marie Caroline is not found? And now the last preparation is complete, and the soldiers take up their line of march in three columns for the street *Haute du Château*.

At Duguigney's the meal is over, and from a window Marie Caroline watched the soft moonlight silvering the towers of the castle. The solemn stillness oppressed her, and the warning letter haunted her imagination.

Guibary, one of her friends, stood near, enjoying with her the beautiful scene—when see, hark! arms glitter in the moonlit streets, the clink of musketry breaks the evening quiet, and the heavy, regular tread of soldiery echoes over the pavement as they approach and halt before the house.

"Treason! treason!" cries Guibary; "conceal yourself, madame."

In a moment the house is in confusion, and the sudden, unexpected danger makes her friends lose all self-control.

But, cool herself, the duchess soon reassures them. She hastens to her refuge in the attic, Mesnard, Guibary, and Mademoiselle Kersabiec following. The small apartment can hold four persons if the search is not obstinately prolonged.

The raps of the soldiers now resound on the door; it is opened, and the police, commanded by Joly, enter. At the same moment the spring in the small chamber closes the mantel, and the fugitives are beyond pursuit.

Joly tramps rapidly through the house. Every room seems familiar, for Deutz has faithfully described them.

Police are scattered everywhere; all are armed with pistols, and one of them handles his so awkwardly that it explodes, and the man is wounded in the hand.

This troubles the party within.

"They shoot at our friends," said the duchess.

"Aha!" exclaims Joly, entering the dining-room. "So there is supper for seven, and only four ladies—the sisters Duguigney, Madame de Charette, and Alceste Kersabiec."

Joly ascends higher; full well he knows the stairs.

"Here is the reception-room," he remarks, aloud.

"It is true. Deutz is the traitor!" the duchess whispers to Mesnard.

She was angry, yet also deeply pained, for she had distinctly heard the words of the detective.

Joly searched the room, and behold! on the table lies the letter warning the duchess of her false friend.

She is doubtless still in the house and must be found; so Joly posts the gendarmes in all the rooms; the approaches to the house are guarded; crowds gather on the outskirts; and half of Nantes is astir.

A search now commenced that seemed almost like pillage; for closets were broken open, furniture overturned, while workmen were busy examining the walls. Masons and carpenters were called upon to advance opinions as to whether hiding-places could exist, and all during this time the noise and confusion were distinctly heard by the poor prisoners.

Nearer the danger threatened, the little chamber was entered, and

but a thin partition separated them from their pursuers. Closer they gather in their dark hiding-place, while the heat momentarily becomes more intolerable.

"A secret place here is impossible!" the carpenters exclaim.

Can this be ignorance or generosity?

The soldiers seem satisfied and leave the room; therefore, the prisoners begin to have some hope.

Confusion still reigns on all sides—heavy raps resound before, behind, in every direction; even the walls of the adjoining house are so struck and bored that masses of brick and mortar fall upon the prisoners in their small room. Only four feet beyond the workmen steadily continue their efforts, while the dust becomes stifling. The wall cannot stand much longer, and, to add to these horrors, they hear now the clang of heavy arms mingling with the threats and curses of tired soldiers and workmen.

During this period the ladies guarded below behave like heroines. They calmly take their supper, though all the while closely watched by the police. Charlotte Moreau, the maid of the duchess, and represented by Deutz as possessing important information, and Marie Boisé, the cook, are both firm, even against three thousand francs. The night grows late, and the men are less eager. The houses in the neighborhood have been searched, but without result. The duchess has escaped, and Duval gives orders to retire. But sentinels still remain in the rooms, and at the door the National Guard replace the tired gendarmes. Anxiously the prisoners listen, and they are just about to draw aside the metal plate that the air may refresh them, when, bark! the door opens, and two soldiers enter.

The duchess can distinctly see them through a crack, as they settle themselves comfortably in the room. So there is no hope for those in the little cell. The ceiling in the outer room is so low that the men can scarcely stand upright, and, the feverish excitement of the past few hours over, they begin to shiver with cold. The duchess realizes this as her own icy hand touches her companions. And see—one of them leaves the room, and returns with an armful of turf. The prisoners are in despair, for a fire will be lighted, the iron plate quickly grows red hot, and the duchess stands but six inches removed from this. No escape from suffocation seems possible. Already the flames crackle, fire gleams through the chinks in the plate, but as yet the heat only serves to warm the half-frozen prisoners. "Look!—look!" whispers the duchess. The plate is red, the iron glows, even the walls are becoming hot, and a suffocating smoke fills the place. At the same time the work in the adjoining house recommences, the flames brighten, and hope revives as the duchess remarks that one of the gendarmes has fallen asleep, notwithstanding the noise—while the other only carelessly attends to the fire.

Mesnard has succeeded in breaking out a few tiles—fresh air fills the room, and the noise of the workmen gradually grows less, at length entirely ceasing.

"Saved!" softly whispers the duchess.

"Saved!" repeat her companions.

But the gendarme is weary himself, and also needs rest; therefore he rouses his sleeping comrade, who yawns while he stretches himself, and stands up shaking with cold. Then he looks around for something to kindle the fire, and, by a sad mischance, his eyes fall upon a bundle of papers lying under the table. At once he pulls these toward him, and relights the fire.

In a moment the little interior apartment is filled with smoke—the prisoners can scarcely breathe—and they press their mouths against an opening in the roof, from which they greedily draw in the fresh air.

The iron now glows with heat, white stripes appear, while the smoke grows dense and more suffocating. Rats scramble over the floor, driven from their holes by the smoke, and troops of lizards glide over the beams and rafters.

The duchess is nearest the glowing metal, the bands crack, for the old chimney has never known such heat before. A fearful dread seizes upon the prisoners—they feel all the horrors of the death impending.

Twice the dress of the duchess caught, and twice her own hands smothered the flames—and long years after did those brave hands bear testimony of the agony of that night.

Each moment adds to the intensity of the fire—they can scarcely breathe, and in low tones entreat the duchess to surrender, but still she firmly refuses. For the third time her dress burns, and, in extinguishing it, her hand accidentally touches the spring, and the iron mantel parts. Mademoiselle Kersabiec instantly attempts to close it,

but her hand comes in contact with the hot iron, and she gives a suppressed cry of pain.

"Oh, there are rats!" said the gendarme, who has been busy reading the papers. The turf has fallen together, and he awakens his companion, when both draw their swords for a rat-hunt. The heat grows more fiery, and, as the clashing swords fall upon their ears, the duchess consents, and Mademoiselle Kersabiec totters, as she raps against the iron. "Who is there?" cries the gendarme.

"We surrender—open—extinguish the fire!" replies mademoiselle. The gendarmes start affrighted—are human beings here?

Hastily they put out the fire, but no one is yet seen, and, not suspecting the spring, they are startled as the wall opens and a lady appears, followed by a young girl and two gentlemen.

"My friend," says the lady, turning to the astonished soldier, "I am the Duchess de Berri."

The other gendarme had gone for the commissaire, who arrives with the order for arrest, which he at once reads, and then begins to question her.

"Sir," said Marie Caroline, interrupting him, "I do not intend to answer you—I wish to see General Dermancourt."

A few moments later the general entered, accompanied by the procureur, General Bandot.

Faint from excitement, the duchess had fallen into a chair, and, with Mesnard's help, manages to drag herself into an adjoining chamber, for the staircase and rooms are filled with curious people.

"General," she said, "I confide myself to your honor."

"Madame," he replied, bowing low, "you are under the protection of French soldiers."

She was very pale, and nervous with agitation—the agony of the last few hours, not fear, makes her faint—and again he leads her to a chair.

"General," she continues, "I have but fulfilled a mother's duty—I only desired to regain the inheritance of my son!"

As she utters these words, all her firmness, her self-control, leave her—and, with difficulty, she collects herself sufficiently to plead for her friends.

In a few moments Duval approaches her; he does not even uncover his head; but, staring impertinently, says, "All right—she is the one!" then leaves the room.

The house is now searched for papers, and, when the duchess calls her friends to say farewell, a scene of great excitement ensues.

The streets are thronged, for the sympathy for Marie Caroline is universal. Nantes looks upon her as a martyr. The general offers his arm.

"We must leave the house, your highness," he tells her.

"Where do you take me?"

"First to the castle, then—"

"To Blaye?—in prison?"

Dermancourt is silent.

"My friends," she exclaims, "let us go!"

As she crosses the attic room, she glances toward the chimney.

The fire is extinguished, and the plate forming the entrance open.

"General," she says, smiling, "if I had not feared the fate of St. Laurence, you would not now lead me thus away."

In the streets the soldiers present arms, and a murmur of pitying sympathy sounds through the crowd.

The distance to the castle is short, and the whole party arrive there by eleven the next morning. Nobly the duchess deported herself during her prison-life, for the confinement did not pain her nearly as intensely as the treachery of one who had only received kindness from her.

JOHN GREENLEAF WHITTIER.

THE lives of men of letters, however interesting to their admirers, seldom commend themselves to the attention of the biographer on account of the adventures by which they are characterized. Literary biography is the most delightful of all reading; but, in most cases, it is the reading which is most difficult to write. Never ready-made, like military or naval biography, it must be sought out—a little here, and a little there—and, when found, made the most of by the skillfulness of its arrangement and presentation. Confined to the inner life of the subject, it necessitates the possession of a certain

amount of psychological knowledge on the part of the biographer, who must be able to put himself in the place of his hero, so far, at least, as to write "from within, outward." The lack of this knowledge has rendered many writers, able enough in other respects, unfit to be biographers—a notable instance of late being Mr. John Forster, whose life of Walter Savage Landor is the most tantalizing and unsatisfactory of literary biographies. We make these remarks the text of what follows, not so much to excuse any shortcomings of our own, real or imaginary, as to account for the apparent paucity of our knowledge in regard to Mr. Whittier. He has lived upward of sixty years, but his life is not of a kind to interest the world at large. In this he resembles many of his brotherhood of thinkers and poets, of whom it may be said, with more truth than of any other class—

"The world knows nothing of its greatest men."

JOHN GREENLEAF

WHITTIER was born at Haverhill, Massachusetts, in December, 1807. His family were Quakers, who had succeeded in establishing themselves on the banks of the Merrimac, in spite of the persecutions to which they were subjected by their Puritan neighbors, to whom the Friend, in his drab coat, was as great an abomination as the foe in his war-paint and feathers. He lived on the homestead, which is still standing, or was recently, until his twentieth year, dividing his time between the old farm, upon which he worked, and poetry, which he occasionally contributed to the *Haverhill Gazette*, not forgetting shoemaking, which he pursued at intervals, as was the custom forty or fifty years ago among the thrifty sons of Massachusetts. The "gentle craft of leather"

numbered its poets and thinkers in past times, as Mr. Whittier reminds us in his poem "The Shoemakers":

"Thy songs, Hans Sachs, are living yet
In strong and hearty German;
And Bloomfield's lay, and Gifford's wit,
And patriot fame of Sherman.
Still from his book, a mystic seer,
The soul of Behmen teaches,
And England's priestcraft shakes to hear
Of Fox's leathern breeches."

Mr. Whittier cannot be said to be one of the guild, however, if it be true, as one of his biographers has insinuated, that the world would go barefooted if St. Crispin had never had a more devoted disciple.

After one year of academy-life elsewhere, we find Mr. Whittier, in 1829, the editor of the *American Manufacturer*, a journal published in Boston in the tariff interest, and, it is to be presumed, on the side of protection. He must by this time have acquired a local reputation

as a writer of prose, for the proprietors of newspapers, however humble, are not in the habit of intrusting their enterprises to the hands of those who are only known through verse. We are strengthened in this belief by the fact that during the next year Mr. Whittier became the editor of the *New-England Weekly Review*, a Hartford journal, which the poet Brainerd had at one time conducted, as well as the late George D. Prentice, whom Mr. Whittier succeeded. In 1831 he published his first volume of prose—"Legends of New England"—a series of sketches devoted to Indian and Colonial traditions and superstitions, a by-path of literature to which he was early drawn, and in which he still delights to walk at intervals. We find mention of an earlier work in verse, entitled "Moll Pitcher," the tale of a witch of Nahant, but we have never seen it. In 1832 he published a memoir of Brainerd, prefixed to the second edition of his "Literary

Remains;" and, in 1833, an essay, the purport of which may be gathered from its title, "Justice and Expediency; or, Slavery considered with a View to its Abolition." A little later he was at work on the old farm again, advanced (if the reader chooses) from the chair of the editor to that of the law-maker, by representing his town in the State Legislature. In 1835 he published "Mogg Megone," a metrical romance, the hero of which was a chief of the Saco Indians in the war of 1677. He edited the *Pennsylvania Freeman*, an antislavery journal published in Philadelphia, in 1838-'39, during which time his office was sacked and burned by a mob. Afterward he acted as one of the secretaries of the Antislavery Society, and edited the "Antislavery Reports" and the *Lowell Standard*. In 1840

JOHN GREENLEAF WHITTIER.

he removed to Amesbury, Mass., where he has ever since resided, satisfied, it would seem, with his few years' experience of editorial life. For a time connected, as corresponding editor, with the *National Era*, the last thirty years of his life may be said to have been devoted to literature exclusively. In 1847 he published "Margaret Smith's Journal," and "Supernaturalism in New England;" in 1848, "The Bridal of Pennacook," an Indian poem, and "Voices of Freedom," a collection of antislavery poems extending over a period of fifteen years; and, in 1850, "Songs of Labor," and "Old Portraits and Modern Sketches," the last being a series of prose-papers on Bunyan, Baxter, Ellwood, Naylor, Andrew Marvell, John Roberts, William Leggett, and Robert Densmore, a Scottish poet who tuned his rustic pipe at Haverhill at the close of the last and beginning of the present century. These volumes were followed by "The Chapel of the Hermits, and other Poems," in 1852; "Literary Recreations," in 1854; "The Panorama, and other Poems," in 1856; "Home Ballads," in 1860; "In War Time," in 1863; "Snow Bound, a Winter Idyl," in 1865;

"The Tent on the Beach, and other Poems," in 1867; "Among the Hills," 1869; and "Miriam, and other Poems," in 1871.

Such, in brief, has been the outward life of John Greenleaf Whittier.

Mr. Whittier is, in some respects, the most American of all our poets. From the beginning two elements were prominent in his poetry, either of which proved him to be a good patriot, if not a good poet. We mean his belief in a poetical side to Indian life, something therein capable of being made poetical, if not of itself inherently so, and a similar belief in the early colonial life of the white race in this country, its adventures, its trials, and its triumphs. We respect and agree with the latter; the former we consider a delusion.

It has been a fashion among poets, time out of mind, to admire the ages and peoples that were, rather than the age and men that are; and the more remote and primitive the former, the greater their admiration. To the poetic mind there may be some apparent ground for this belief, but to the saner, practical mind, there is none whatever—the age in which we live being the best age, as the better age will be the age in which we are to live. Be this, however, as it may, and admitting the possibility of a poetic side to the life of a pastoral people, we deny that there is any poetry in the life of a race of savages. "The noble savage" is a myth which never had any existence outside of books. Mr. Whittier thinks otherwise, or thought so in his younger years. It would be interesting to trace the origin and progress of Indianism in American literature; but we must not be tempted into it now: enough, that it has been shared, at one time or another, by most American poets. It would be safe to say that, twenty or thirty years ago, one could not open a volume of American verse into which this tiresome old aborigine was not thrust. He was everywhere. His peaceful manners and innocent customs were served up in pretty little lyrics and idyls, and dirges were sung because he was melting away like snow before the fierce sun of civilization. He was glorified in epics, as in "Yamoyden," for example, and "Frontenac," and "The Song of Hiawatha"—the last the nearest approach to poetry possible in Indianism. We shall not compare Mr. Whittier's Indian poetry with that of any other poet, but dismiss it as being as good as the average. The story of "Mogg Megone," what little there is of it, is painful rather than tragic, reminding us somewhat in its handling of the metrical romances of Scott. Scattered through it, as through "The Bridal of Pennacook," is a wealth of allusion to and knowledge of Indianism, mostly in the shape of descriptive items, which are not very well fused, and which rather retard than advance the interest. Description is a strong point with Mr. Whittier generally, but it is a weak one in these poems, where it often runs into excess. He has succeeded much better, we think, with the colonial portion of our history, the poems which these have inspired ranking among his happiest efforts. His earliest reading seems to have lain among these dusky old records, which have exercised a greater charm over him than over any other American singer. How powerful this charm is, may be seen in such poems as "Cassandra Southwick," a story of Puritan persecution of the Quakers, in 1658; "The Exiles," another story of persecution, the victims of which were a sturdy Puritan family who were forced to expatriate themselves to Nantucket for the heinous crime of sheltering a fugitive Quaker; and "St. John," a spirited Huguenot ballad, worthy of Macaulay in his best days. Excellent as these are, however, they will not compare with his later poems of the same character, of which the best are, perhaps, "The Witch's Daughter," "Skipper Ireson's Ride," and "The Truce of Piscataqua." Akin to these in spirit, but less happy in execution, are the poems in which Mr. Whittier has celebrated various localities in New England, some hallowed in his recollection by childish feelings, while others are distinguished for the historical associations which attach to them. It is due to Mr. Whittier to say, that his want of success in some of these poems is not the result of any shortcoming of his own, but inheres in the barbaric names which he felt it to be his poetic duty to retain and perpetuate. That there is often poetry in mere names, Milton and others of the English poets have shown; but these names are not such as prevail in our so-called Indian poetry; not the aboriginal names of insignificant rivers, petty mountains, and savage chiefs, but the classic names of old battle-fields, cities, kingdoms—Trojan, Greek, Roman—the names of sages, kings, heroes. We should ransack all the Indian names in vain for such a sounding passage as this:

"And what resounds
In fable or romance of Uther's son,

Begirt with British and Armoric knights;
And all who since, baptized or infidel,
Jousted in Aspramont or Montalban,
Damasco, or Marocco, or Trebisond,
Or whom Blerta sent from Afric shore,
When Charlemain with all his peerage fell
By Fontarabia."

Another characteristic of his poetry not yet mentioned, stamps Mr. Whittier as the most thoroughly American of all the American poets. We allude to its antislavery element—an element which we cannot but feel struck its roots early in the most serious part of his nature, and which has always ranked among his profoundest convictions. It may be said, indeed, to have dominated over him during the greater part of his life. We may like it, or we may not; but there it is, and there it was, and there it will be to the end. It shows the man more strongly, we are inclined to think, than any thing else that he has written; but, except at rare intervals, it does not show him at his best. We mean his best as a poet. We do not believe in the poetry which is inspired by morals or politics. It is not poetry; it is politics and morals in verse. Mr. Whittier's antislavery verse, which is now happily antiquated, except as literature, appeals to our sympathies most strongly when it touches the pathetic aspects of slavery, as in "The Farewell of a Virginia Slave-Mother," and "Song of Slaves in the Desert." We must quote a stanza or two from the last:

"Where are we going? where are we going?
Where are we going, Rubee?"

"Lord of peoples, lord of lands,
Look across these shining sands,
Through the furnace of the noon,
Through the white light of the moon.
Strong the Ghiblee wind is blowing,
Strange and large the world is growing!
Speak, and tell us where we are going,
Where are we going, Rubee?"

"When we went from Bornon land,
We were like the leaves and sand,
We were many, we are few;
Life has one, and death has two:
Whitened bones our path are showing,
Thou All-seeing, Thou All-knowing!
Hear us, tell us, where we are going,
Where are we going, Rubee?"

A peculiarity among American poets, as compared with their fellow-singers in England, is the habit which they appear to cherish of celebrating in verse their personal friends, and those who share their views in regard to morals and moral ideas. Ready as they are at all times to manifest their personal love or admiration, the foremost lag far behind Mr. Whittier, who has sung of nearly every person that was worth singing about in the ranks of antislavery and reform, generally in excellent taste, often exquisitely. He has also overcome the difficulties which attend the writing of obituary poems, to which he imparts a sincerity and earnestness seldom found in writings of this kind. His grief is never commonplace, his reflections are never trite. How admirable are these stanzas, addressed to Joseph Sturge, of Birmingham, on the death of his sister:

"Not upon thee or thine the solemn angel
Hath evil wrought:
Her funeral anthem is a glad evangel—
The good die not!"

"God calls our loved ones, but we lose not wholly
What He hath given:
They live on earth, in thought and deed, as truly
As in His heaven."

And this from the poem entitled "Gone:"

"And half we deemed she needed not
The changing of her sphere,
To give to Heaven a Shining One
Who walked an angel here.

"Fold her, O Father! in Thine arms,
And let her henceforth be
A messenger of love, between
Our human hearts and Thee.

"Still let her mild rebuking stand
Between us and the wrong,
And her dear memory serve to make
Our faith in goodness strong."

"And grant that she who, trembling here,
Distrusted all her powers,
May welcome to her holier home
The well-beloved of ours."

Mr. Whittier is fortunate in portraying what he conceives to be the mental character of those whom he celebrates, particularly so in the case of Follen, John Woolman, whose writings Lamb advised one of his correspondents to get by heart, Channing, Webster, and Randolph. Our estimate of Webster differs from his, but we recognize the great excellence of his "Ichabod," considered as a poem simply, and the nobility of feeling which prompted it, mistaken as we consider the judgment which it renders. "Randolph of Roanoke" is a manly tribute to one of the most marked characters in our political history:

"He held his slaves, yet kept the while
His reverence for the human:
In the dark vassals of his will
He saw but Man and Woman!
No hunter of God's outraged poor
His Roanoke Valley entered;
No trader in the souls of men
Across his threshold ventured."

Another characteristic of Mr. Whittier's poetry is its continual reference to the personages mentioned and the incidents described in the sacred writings. The Hebraic element is a marked feature in his genius. That it is capable of being turned to the grandest poetical account, Milton has shown us; that it is powerful, even in lesser hands, every reader of English poetry knows. If the Bible has no other effect upon those who read it, it has the effect which the best English ever written or spoken cannot fail to produce in thoughtful minds—the sense of satisfaction in simple and noble thoughts, expressed in simple and noble words. Mr. Whittier has his Bible at his finger-ends, and is as familiar with its history as with that of his native land. He has walked and talked with seers and prophets, has seen the cloud by day and the pillar of fire by night, and has heard the thunder and the still, small voice which followed it:

"In sudden whirlwind, cloud, and flame,
The Spirit of the Highest came!
Before mine eyes a vision passed.
A glory terrible and vast;
With dreadful eyes of living things,
And sounding sweep of angel-wings:
With circling light and sapphire throne,
And flame-like form of One thereon,
And voice of that dread Likeness sent
Down from the crystal firmament."

The Hebraic cast of Mr. Whittier's mind, joined, perhaps, to his descent from a once persecuted sect, accounts for the serious character of his poetry in general, and particularly for the indignant, fiery spirit which burns at a white heat in his antislavery verse. Being the man he is, he could not have written other than he has. For our own part, we wish he could have persuaded himself to let others do the moral work he had in hand so long; for we are sure that he would have gathered for us a riper and more abundant harvest of poetry. He is never so much a poet as when he gives himself up to the contemplation of imaginative themes, as, for example, in "The Wife of Manoah to her Husband," "A Dream of Summer," "Hampton Beach," "Memories," "Questions of Life," "To my Old Schoolmaster," "Tavler," "The Barefoot Boy," most of the "Home Ballads," and all the "Songs of Labor." At first sight, the object proposed in some of these appears to be realistic; but the spirit in which they are conceived, and the style in which they are wrought out, are so poetical that the final effect is such as imagination alone can leave. Our favorites are in the "Songs of Labor," which only an American poet could have written, and no American poet except Mr. Whittier. They are admirable.

The more we think of it, the firmer becomes our conviction that Mr. Whittier has not done his genius justice. The Hebraic element is strong within him, as we have noted; but quite as strong are other elements, among which are perfect freedom of thought in theological matters—the outgrowth, probably, of his Quaker descent and associations—and his supreme love of and satisfaction in Nature. Without being a freethinker, in the old and abused sense of the term, he is one of the freest of our thinkers, following in this habit of mind the example of Mr. Emerson, whose influence his poetry at times reflects, as in his "Questions of Life." Witness this passage:

"Through the vastness, arching all,
I see the great stars rise and fall,

The rounding seasons come and go.
The tided oceans ebb and flow;
The tokens of a central force,
Whose circles, in their widening force,
O'erlap and move the universe;
The workings of the law whence springs
The rhythmic harmony of things,
Which shapes in earth the darkling spair,
And orbs in heaven the morning star.
Of all I see, in earth and sky—
Star, flower, beast, bird—what part have I?
This conscious life—is that the same
Which thrills the universal frame,
Whereby the caverned crystal shoots,
And mounts the sap from forest-roots,
Whereby the exiled wood-bird tells
When spring makes green her native dells?
How feels the stone the pang of birth
Which brings its sparkling prism forth?
The forest-tree the throb which gives
The life-blood to its new-born leaves?
Do bird and blossom feel, like me,
Life's many-folded mystery—
The wonder which is yet to be?
Or stand I severed and distinct,
From Nature's chain of life unlinked?
Allied to all, yet not the less
Prisoned in separate consciousness,
Alone overburdened with a sense
Of life, and cause, and consequence?"

Mr. Whittier's love of Nature is so strong that it cannot escape the notice of even his most careless readers. Early and late it has distinguished all his poems, especially "Snow Bound," which contains, besides its dainty little collection of wintry pictures, portraits of various members of the poet's family, painted with a masterly hand.

Not to dwell longer, however, on what we conceive to be the excellences and defects of Mr. Whittier's genius, we close our imperfect remarks with a bit of verse with which we entirely concur. It is the poet's judgment upon himself and his poetry:

"Of mystic beauty, dreamy grace,
No rounded art the lack supplies;
Unskilled the subtle lines to trace,
Or soften shades on Nature's face,
I view her common forms with unanointed eyes
"Nor mine the seer-like power to show
The secrets of the heart and mind:
To drop the plummet-line below
Our common world of joy and woe,
A more intense despair or brighter hope to find.

"Yet here at least an earnest sense
Of human right and weal is shown:
A hate of tyranny intense,
And hearty in its vehemence,
As if my brother's pain and sorrow were my own.

"O Freedom! if to me belong
Nor mighty Milton's gift divine,
Nor Marvell's wit and graceful song,
Still, with a love as deep and strong
As theirs, I lay, like them, my best gifts on thy shrine!"

R. H. STODDARD.

THE SCENERY OF THE MOON.

PREVIOUS to the invention of the telescope, the dark regions of the moon were supposed to be seas; their titles are therefore of ancient origin, with the exception of a few dark spots of recent discovery, and which have also been named seas, in order to leave undisturbed the primitive classification.

The telescope has revealed the fact that the dark plains of the moon are but the most ancient surface formations more or less abraded and smoothed, and which, from some cause, have lost their original brilliancy. The bright portions, from the sharpness of outline and fresh appearance of their details, are considered to be of the most recent origin.

The telescope has also shown that the lunar surface is studded with mountain-ranges in the form of rings which enclose circular plains of all dimensions, from a hundred and fifty miles in diameter downward, until from their mere minuteness they become invisible in the most powerful telescopes.

The "rampart rims" of the larger basins present a wonderful variety of turret and terrace, and are not surpassed in rugged moun-

tain magnificence by the Alps or the Andes, while the decrease in size seems, as a rule, to bring with it a certain character of modification which eventually gives to the smaller-sized basins the appearance of cup-shaped fountains, whose regular rims lose all the roughness which characterize the massive boundaries of their predecessors.

Many of those basins of all sizes have bright streaks radiating from them, which, in some cases, may be traced to over a thousand miles from their sources, but the nature of which is still considered obscure. Other classes of lunar mountains are not so unlike those of our earth. Far to the northward, upon the verge of the evening crescent, for instance, the dark outline of *Mare Humboldtianum*, or the Sea of Humboldt, with its bold boundary of mountains limiting the range of telescopic vision and gaining an altitude of sixteen thousand feet, would almost make us forget that we are not wandering among the scenery of our native world.

About one hundred and fifty miles eastward of the Sea of Humboldt, there rises an annular mountain, enclosing a basin of about fifteen miles in diameter, named *Thales*. If we suppose ourselves to commence a lunar journey from this point, we may begin by tracing upon every hand the mighty effects produced by the strange causes which have fashioned the scenery of the moon.

Away to the northward stretches a mountain-ray of *Thales*, until it disappears over the distant horizon, its eastern face descending abruptly to the valley, while its opposite slope is much more gradual. Like all other ray-ridges which radiate from basins, it is highest at its source, decreasing in altitude as it recedes, until all trace of its existence is finally lost in the common level.

Leaving behind us a variety of other ridges which radiate from the same basin, we turn our faces to the west and traverse the apex of a massive continuous highland for five hundred miles, until it is intercepted by a rampart mountain, which encloses a plain of a hundred and ten miles in diameter, about the base of which the ridge is dispersed and lost in the common level, like the sedimentary remains of a great stream. As the slowly-rising sun illuminates the peaks and ridges which compose the rampart of this mighty amphitheatre, we can easily understand that an observer, situated upon one of the peaks of a grand mountain-mass which rises from the centre of the plain, might see its rim as a brilliant but broken thread of light encircling his horizon forty miles away, while himself and the enclosed plain would still be obscured in the deep gloom of a lunar light. The pale orb of our earth, too, four times as great in apparent diameter as the sun, ever and anon slowly rising and setting across a point upon the southeastward verge of the horizon, never ascending or descending but a few degrees above or below it, altogether composes a scene so unlike any which occurs upon our earth, that we can almost sympathize with the ancient poetic superstition which assigns to our satellite the position of an "enchanted world," and can even half forgive the modern scientific speculator who, for the want of a better interpretation, pronounces it a "dead star," or a "worn-out planet," forgetful that a "dead star," a "worn-out planet," or an "enchanted world" are all equally unintelligible to us.

Making our way to the southeast for several hundred miles through a country studded upon every side with strange, unearthly mountain-formations, but leaving to our right a lofty range not so unearthly, named *Mount Taurus*, we toil up the steep slopes of *Proclus*, and ascend to the apex of its narrow circular rim, which encloses a deep basin of about fifteen miles in diameter.

Perhaps no point upon the visible hemisphere of the moon commands a grander view than this. From almost beneath our feet, but far below, at a dizzying distance, stretches out to the westward the beautiful *Mare Crisium*, with its well-defined and abrupt mountain-boundaries, towering in places to sixteen thousand feet above the plains, and enclosing an area of seventy-eight thousand square miles, or more than half as large again as the State of New York. In some stages of illumination it has been seen speckled with minute points and streaks of light, from which may, perhaps, have been derived its glittering title, and which, we shall see, are in all probability small sheets of water.

The surface of this plain seems to be somewhat depressed below the general level of the moon; but that bold promontory, jutting far into the southwest region, rises above the lowlands eleven thousand feet; while another peak gains an altitude of nearly three miles, from which the rising sun projects a long, dark shadow over the plain below.

Along the slope of one of the mountains which stand like sentinels in the sea, long, white ridges, resembling ramparts, have been seen by many observers, and from behind which some lunar patriots may, perchance, have defended their beautiful valley against the aggressions of ambitious neighbors.

The mountain-ridges, formed by the flow from the basin upon whose verge we suppose ourselves standing, trend north and south, forming the eastern boundary of *Mare Crisium*. The descent from the apex of the rim to the general level of the surface is more precipitous than is usually the case with mountains of this character; the ridge, however, though forming but a single range, as it were, is cut into various lesser ranges as their distance increases from the parent-basin, assuming the usual character of radiates.

Turning our faces now toward the southeast, we see far below us the rugged *Palus Somni* jutting its grand promontory a hundred miles away into the dark plain of *Mare Tranquillitatis*, which stretches in infinite variety to the east and south, forming islands and bays and headlands, which, by contrast with the dark plain, sparkle in lunar splendor. From this sea rises the small range of *Mount Argeus*, ascending gradually from its western base to a summit which rivals the most lofty peaks of our Pyrenees, then abruptly breaks into a tremendous precipice which, in the sunrise, casts a long spire-like shadow over the dark expanse below. Near this, and rising from the same sombre field, is the finely-terraced ring-mountain *Plinius*, enclosing a circle of thirty-two miles in diameter, filled with hillocks of every variety, which glitter in their mighty setting like the jewel of some gorgeous diadem.

To the southward of *Mare Tranquillitatis* and connected with it, lies that of *Mare Nectaris* and of *Fecunditatis*, divided from each other by a great peninsula and the mountains of the Pyrenees, from which we enter upon a region to the southward, where the forces which modelled the surface seem to have been not only comparatively modern, but everywhere active; for, spread out before us lies a vast extent of country whose "ring-mountains" of all magnitudes, terraced, turreted, and grooved, are to be found in every direction; ridges and valleys, too, complicate the heterogeneous variety, until we find ourselves in a labyrinth of wild mountain magnificence so utterly unlike any thing to be found upon the surface of our world, that, failing to realize that the causes and forces which fashioned the topography of this world and that must be wholly distinct and different, is simply to misunderstand the nature of the subject.

Nowhere upon the surface of our world does there exist such a structure as a ring-mountain, while upon the moon they are the prevailing forms, up to the present over thirty thousand having been discovered upon the visible hemisphere, and, though they are said by astronomers to be of volcanic origin, I confess my own inability to discover the slightest analogy between *Mount Vesuvius* and a circular walled plain equal in extent to the quarter of Italy, or which would enclose three such States as Massachusetts, especially as the volcano is a mere cone projecting above the surface of the earth, its crater forming but a slight depression at the top, while the lunar basin has its interior plain three times as much depressed below the apex of its mountain-rim as that apex rises above the general level of the moon's surface upon the outside.

Pausing to look about us, as we enter this region from the north, we see behind us the wide and variegated plain of *Mare Fecunditatis*, with its dark, prairie-like expanse studded with "butes," small ring-basins, and the curious comet-like structure projecting from its centre toward its western boundary, and having for its double nucleus two small but beautifully-defined basins.

To our right lie the mountain-masses of the Pyrenees; to our left, several magnificent walled plains—*Langrenius*, seventy miles in diameter, with its multiple ring rising ten thousand feet above the floor of the basin, and looking, in the rays of the rising or setting sun, like concentric threads of silvery light, its brilliant central mountain gleaming like a star of the first magnitude above the deluge of darkness which obscures the encircling plain for forty miles away; *Vendelius*, too, and *Pitavius*, on a scale of rival splendor, but differing in variety of details; while far away to the westward, through a region abounding in curiosities, stretches for hundreds of miles a narrow and almost straight valley, clearing to its bottom every obstruction which lies in its path.

Already we encounter the mysterious lines of light which are so distinctly seen to radiate from *Tycho* in the full-moon photograph,

MR. BOYLE'S MODEL OF THE MOON.

although that most remarkable of lunar basins is yet more than eight hundred miles away. Yonder, to the right, is one of those curious rays cutting nearly through the middle of the Mare Nectaris, where it encounters a small ring-mountain whose slender rampart it has not destroyed, though the flow which formed the same ray has borne a conspicuous part in the destruction of more formidable mountain-masses nearer to its source, as may be seen by examining the ruined ramparts of what were once fine examples of the ring-mountain formations.

In the region marked by two walled plains, known as Stoffer and Fernelius, whole sections of rampart-mountains, once formidable in extent and structure, have yielded to the flow directed from Tycho, though two hundred miles distant from the source. Behind the masses which survived destruction, long drift-like ridges have been formed, such as are commonly to be found behind obstructions in the beds of rivers. The ray which crosses Mare Nectaris is evidently a structure of this kind, where the flow at so great a distance from its source, not being in sufficient volume to overwhelm the obstruction, merely swept round its base, forming behind it the characteristic drift, the prototype of which may be found as frequently upon our own earth as upon her satellite.

A careful examination of even the lunar photographs already in our possession will also show that most of the main rays which surround Tycho, as well as those of other centres of radiation, are channelled, and have consequently two or more embankments, frequently extending throughout their entire length, and disappearing only when the ray itself ceases to be distinguishable from the ordinary *débris* of the surface, thus demonstrating that they have been constructed in a similar manner to the banks of rivers which flow through the delta they deposit.

The remains of a great ray, with two massive parallel embankments which take a northeasterly direction from Tycho, furnish so striking an example of the delta-structure that, were we to imagine a few miles of the Nile, the Ganges, or the Mississippi, abandoned by their waters anywhere in their deltas, we would have a very fair miniature representation of this great lunar relic of subsided forces. The lunar chasm, however, would be somewhat the most rugged, owing partly to the roughness of the surface over which it was originally directed, as well as fresh eruptions which broke out in its course at an early period of its history, intercepting and turning the flow in another direction, thereby preserving the early form of the channel and its embankments as well as saving from submergence the ancient surface formations upon that side of Tycho, which from this direction

approach the great modern basin within about two hundred miles, while the country upon every other side has been overlaid by the evolved sediment for over seven hundred miles away from the centre.

As the decrease in the amount of water evolved from those sources was gradual, the depressions and channels would be slowly filled by the subsiding sediment; hence the early form of this great northeastern ray has been preserved by the interception of the flow previous to the period of its decline.

As if to contrast the long, slender drift of the ray from Tycho, there projects also into Mare Nectaris a curious headland, which rises with a gradual slope to a considerable elevation; it takes the form of the "stock" of a hunter's rifle, and is surmounted by a ring-basin of twelve or fifteen miles in diameter; the boundary which assumes the outline of the upper edge of the weapon supports the rampart-walls of three fine enclosed plains, each about fifty miles in diameter; they present a magnificent landscape when illuminated by the slanting rays of the sun. A portion of the rampart of one towers above the plain within to the height of eighteen thousand feet.

Crossing, now, the range of the Altai Mountains, we find ourselves in a region fairly honey-combed with circular depressions, walled in by all sorts of battlements, whose multiform tops glitter in the rays of a slanting sunlight, like an

A CLIFF IN THE MOON.

A MOUNTAIN-RANGE IN THE MOON.

unfinished galaxy whose infinite variety of forms had not yet crystallized into mere points of dazzling brilliancy.

Continuing our journey eastward for a hundred and fifty miles, we arrive at two fine walled plains, remarkable for their depth and freshness of outline. Werner is about thirty-seven miles in diameter, its narrow rim rising above the plain thirteen thousand feet; but upon its eastern side some of the turrets would overtop Mont Blanc by one thousand feet. Aliacensis is similar to its companion, but fifty miles in diameter.

Northward of this is a group of fine "walled plains," varying in size from sixteen miles in diameter up to one hundred and fifteen. Ptolemæus is the largest, and under proper illumination presents a surface all roughened with wavy ridges interspersed with not less than

forty-six of the smallest-sized basins, making it a very attractive locality for the telescopic traveller, though the rapidly-changing light unpleasantly shortens the period of his wanderings.

From this we enter a country remarkable for clefts, or long, narrow valleys, which, as is usual with this class of lunar formations, cleave to their bottom every object which happens to lie in their track.

Skirting now the Mare Vaporum, and leaving to our right the dark hollow of "Julius Cæsar," we arrive at Manilius, twenty-five miles in diameter, with its broad and peak-decorated rim, so brilliant even upon the night-side of the moon as to have been mistaken by the first Herschel for a volcano in action. Diverging a little to the right, we ascend the sloping sides of Menelaus, which, owing to its brightness, has also

A BASIN IN THE MOON.

been mistaken for a volcano in action, although its basin is about twenty miles in diameter and seven thousand feet deep. Several bright ridges radiate from it, marking the sedimentary remains of its former activity.

Standing upon the elevated rim of Menelaus, we take in at a glance the beautiful plain of Mare Serenitatis. To our right stretches out a long, slender promontory, half embaying the plain, separating it from that of Tranquillitatis, and having a kind of prolongation in a low smooth, serpentine range, which winds away to the northward for two hundred miles. Following the same general parallel but a hundred miles to the westward of this, the plain is traversed for nearly three-quarters of its entire length by a bright ridge, which is visible nearly to the base of Menelaus, and is midway surmounted by a small basin. As we follow this ridge to the northward, there lies to our left, over one hundred miles away, and about seventy-five within the boundary of the plain, the small ring-basin Linne, remarkable for the frequent appearance above it of the mystical white cloud which has so often perplexed astronomers.

Continuing our journey, we emerge from this plain through a rugged mountain-pass, leaving to our left the grand masses of the Caucasian Mountains, and upon our right the fine walled plain of Pusanianus, which contains a bright but minute little basin, over which has also appeared the mysterious white cloud.

Skirting along the eastern shore of the Mare Somnorum, rich in the wild scenery of mountain and valley, where the outlying spurs of the Caucasian Range break into bold promontories and deep inlets, we at length emerge from its rough but picturesque surroundings by winding through another intricate mountain-pass, from which we enter the "Lake of Death," a beautiful mountain-bound valley, one hundred and fifty miles long by about one hundred broad, surmounted near its centre by a very fine though not large ring-basin.

It is difficult to understand why this melancholy title should have been given to a spot so lovely. The King of Terrors could never have chosen this place for his abode, unless his tastes are preëminently artistic; for in the lake, and about it on every hand, the scenery is superb. Not far to the westward of its boundary are a pair of fine ring-plains—Eudoxus and Aristoteles, situated in a country having the appearance, at times, of being sprinkled with innumerable stars.

The wall of Eudoxus is finely terraced on the interior, and rises eleven thousand feet above the floor of the basin; upon the west its rampart is crowned by two peaks, of fifteen thousand feet each. Mount Etna, standing upon the plain, would be overtopped by its rampart, and dwarfed by its turrets.

Aristoteles is remarkable for the great variety of peak and terrace which compose its massive rim, and for minute hillocks which lie about it in rows, radiating from the centre; indeed, the whole country, between those plains and the Lacus Mortis, or Lake of Death, southward to the Caucasian Mountains, is luminous at times with brilliant points.

To the northward of the lake are also two fine circular plains, whose mountain boundaries are elaborately terraced and turreted; the wall of one is double in places, and includes a small basin of recent formation. Northward, still spreads out the "the walled plain" of Endymion, seventy-eight miles across; its massive ramparts rise fifteen thousand feet, and its turrets equal the highest peaks of the terrestrial Alps.

Journeying now to the southeast for five hundred miles, through a country abounding in mountain, plain, and valley, we at length arrive upon the northern bank of the great cleft of the Alps. This singular valley is about eighty-three miles long, varying in breadth from three and a half to five and a half miles, with a depth of twelve thousand feet. It breaks so direct through the highest of the Alps, as to suggest the idea that some mighty meteor had cloven the lunar world, plunging its resistless course in a straight line through the convex surface; though, doubtless, it is the relic of some internal convulsion long since forgotten.

Holding our course along the verge of the cleft, and making our way, as best we can, over and among the Alpine masses, we finally arrive upon the shores of the most remarkable of lunar "seas," "Mare Imbrium."

Before us, to the eastward, and breaking the long level line of the distant sea-like horizon, rises to the altitude of eight thousand feet, the pyramid-shaped outline of Pico, whose slender shadow, waxing

and waning in the rising and setting sun, forms a singularly effective picture from any point of view.

From the northern verge of the sea, the mountain-rim of "Plato" frowns like the battlements of some gigantic fortification, enclosing a very level, circular track, of sixty miles in diameter, and from which extends, to the eastward, a long reach of headlands and bays, whose abrupt shores are grand mountain-walls fronting the plain, and forming the northern boundary of "Mare Imbrium," the area of which is six times greater than that of the State of New York. The eastern side of this "sea" has no boundary, but is continued into the great Oceanus Procellarum, a dark plain three times greater still in extent of surface.

Seven hundred miles away to the southward, the shores of "Mare Imbrium" are bounded by the Apennines, the grandest mountain-chain upon the moon; their average height being nineteen thousand feet, but the cliffs* of Huyghens, which form part of the range, gain an altitude of twenty-one thousand feet, or very nearly four miles above the beautiful valley at their base. This range extends for three hundred miles, presenting to the "sea" an almost perpendicular front; to the eastward, they terminate against the rampart of a circular plain, thirty-two miles in diameter; but their westward extremity forms lower ranges and isolated peaks.

The slope of the Apennines, upon the side away from the "sea," is gradual, but, unlike the mountains of our earth, it is composed of ridges which run transverse to the general direction of the range, forming mountain-passes from the plain to the country beyond. The savage aspects of lowering mountain, and narrow, precipitous defile, presented by those passes, have, in all likelihood, not their equal upon earth, and in comparison with which the Yosemite Valley would dwindle into insignificance.

From the foot of the Apennines runs out into the "sea" a low and rugged plateau, surmounted here and there with masses of considerable magnitude, and, as if a sentient creative cause had loved to dally in and to decorate this beautiful region of the lunar world, three fine ring-basins, differing in size, just enough to give variety, are conspicuously grouped upon the western extension of the plateau, themselves flanked by jutting promontories and outlying mountains, from the bases of which spreads away such an infinite variety of brilliantly-sparkling points as to resemble at times a resolved nebula, and from which, in all probability, was derived its title of Palus Nebularum.

The valley below the range, deep, dark, and impressive, is so suggestive of life and animation, as to lure, at times, the telescopic traveller into dreamy wanderings among its scenery, until the long shadows of the setting sun admonish him that he is forgetting the sterner duties of the scientific observer.

Ascending one of the curious ridges which skirt the valley of the Apennines, and travelling to the eastward along its summit for a few hundred miles, we are conducted to the annular range of another grand basin, fifty six miles in diameter, and worthily named after the great philosopher Copernicus. An ascent of five thousand feet brings us to the apex of this mountain-ring, from which a view is obtained of so marked a character that the causes which fashioned the topography of the moon seem to have mapped themselves into a simple revelation at our feet.

From the centre of the plain a craggy mountain towers in savage grandeur to the height of twenty-four hundred feet, sending aloft six different peaks, which, jutting as they often do, from a field of impenetrable darkness, sparkle in the rays of the rising or setting sun like a star-group encircled far away by the points and threads of light which compose the summit of the rampart range, producing altogether a scene so strange as to recall us, from the contemplation of its splendor, to the realization of the fact that we are wandering among the vestiges of another and very different creation from those of our native world, and he who can perceive an analogy between such a structure and the puny crater of even the proudest terrestrial volcano, must be endowed with a poetic imagination richer far in its wild fancies than even the weird unearthly reality before us.

As the sun ascends above the horizon, we perceive that its rays illuminate long and intricate mountain-ridges, radiating in every direction away from the basin, in the immediate vicinity of which their converging mass forms an encircling table-land about the foot of the

* The small white dots at the foot of the cliffs show what some of our largest buildings would look like by comparison.

mountain-rim. Upon close inspection of those ridges we find that their forms undergo modifications by every obstruction which they encounter, and such as could only result from depositions by water flowing from the basin at their centre. About two hundred and fifty miles to the eastward, there rises from the same dark plain a basin of about twenty-two miles in diameter, named Kepler; two hundred miles to the northward of which rises still a third, somewhat larger, and which is named Aristarchus; those three basins form with each other a triangle, and have evidently been active during the same epoch, for the mountain-ridges which radiate from each are all equally smoothed, and overspread by the same dark tint which pervades all the ancient surface formations of the moon.

Where the ridges which project from the two lesser basins have met about half-way between their respective sources, a continuous embankment is thrown up by the opposing currents along the line of their encounter, and a section of which would be very well represented upon a small scale by the bars formed by the conflict of the waves and streams at the mouths of rivers which empty into the sea.

Where the flows from Aristarchus and Kepler encounter the greater volume from Copernicus, an embankment of not less than three hun-

The shadows of the rampart-wall cast upon the floor of the basin show those traces to be mere sedimentary drift, very little elevated above the surface; it is evident, therefore, that the flow, after finding its way through the fissures and passes of the mountain-rim, filled the basin up, and issued at the opposite side in obedience to the impulse impressed upon it from the direction of its source. A basin under such circumstances would exist as a deep lake, hence the sediment deposited would form a low, broad drift, such as characterizes those found upon the floors of walled plains.

The rays are but little higher at their source than at their termination, although those two extremes may be one thousand miles apart, and, as very slight frosts would prevent water from flowing over such gentle grades to such great distances throughout long-protracted epochs, it follows that the moon is not the frozen world that some philosophers suppose it to be, nor can it possess the insufferably hot climate attributed to it by others, as in that case the waters would have been dissipated by evaporation long before reaching the distance of one hundred miles from their source. It is well known that upon our earth the oppressive effects of solar heat are greatly modified by a dry atmosphere, like that of Australia; therefore, the absence of ex-

A CLEFT IN THE MOON.

dred miles long has been erected, forming a range which connects the table-lands of the two smaller basins, the superior flow having forced the inferior volumes back toward their sources in the relative proportion of the contending forces, leaving unmistakable records of the manner of their formation.

The regions overspread by those markings occupy the greater portion of a continuous system of dark plains, so extensive that it would require twelve hundred miles of travel to cross through the centre in any direction. The shores abound in wild and variegated scenery, and, everywhere upon the surface, hill and valley spread out before the traveller in bewildering variety.

The tops of those ridges appear as lines of light, which deepen into shade as we descend into the valleys. A telescopic observer, situated upon the moon, would see our own mountain-ranges presenting the same aspect. The tops, being more or less bare or abrupt, would glisten in the sunlight, deepening into shade as the vision descended into the valleys, for the increasing density of the foliage would absorb the light in the proportion of its luxuriance.

There are many examples to be found, especially in the fresh tracings of the more recently-formed surface, where rays traverse circular basins of many miles in diameter, proceeding for hundreds of miles beyond the walled plain without changing the original direction.

cessive evaporation upon the moon would imply a correspondingly temperate climate.

Under the impression that all is lifeless upon the moon, her dark plains have been classed as "desert wastes," in order to imply that they are merely the original soil smoothed down into a condition resembling the sands of our deserts, but the smoother any material is made the more light it will reflect, consequently those regions should be the brightest if they are mere wastes of lunar earth, and, as they are the smoothest as well as the darkest, it follows that the original surface-soil must have been overspread by something which has the power of absorbing light. Within the scope of our knowledge nothing could accomplish this result more effectually than vegetation, and even observers who have been almost bitterly opposed to the idea of life existing upon our associate planet have nevertheless placed upon record the fact that at times they have received through powerful telescopes distinct impressions of green color from those dark portions of the surface, and even periodical changes in different localities, which they have reluctantly admitted might possibly be due to alternations of seasons.

The impressions of color made upon the eye by those so-called seas is bluish-gray, which in the photograph always takes lighter than it appears, yet all lunar photographs represent them much darker

than they are seen by the eye, and, as this is exactly what occurs in photographing our own vegetation, it follows that their actual color is not bluish-gray, and that in all probability it is green.

The question occurs, however, What has become of the water which has left such unmistakable evidence of its former presence? The waters of our earth, in the form of vapor, ascend only a short distance above its surface and fall back again. If the moon has no atmosphere, as astronomers assert, then even the most attenuated vapor could not ascend an inch above its surface; therefore, whether that body has an atmosphere or not, water once there could never escape from it, hence there is water still upon the moon.

As a rule, the abraded condition of the larger ring-mountains implies remoteness of origin, while the regularity and sharpness of the smaller basins indicate their more recent formation. As the basins decrease in size, they also increase in numbers in a relative proportion, from which it appears that a progressive modification of the forces was brought about by the water ceasing to act in large masses and at a few points, thereby becoming gradually distributed so as to issue from an infinite number of points, and, therefore, in small quantities, and without violence; consequently, if we hope to find water upon the moon at all, we must look for it in small sheets and fountain-like basins.

Now, there are several classes of observations made upon the moon which still remain an enigma to the astronomer: for example, bright, sparkling, *starlike* points are sometimes observed for a few minutes only, disappearing, to be lost for years, until caught sight of again by some fortunate observer, only to be again lost for another indefinite period of time, though the locality may be surveyed with the most scrupulous care. Those spots never occupy a space of over four or five miles in diameter; they are not elevations, for they cast no shadows, and, if they were, they would be visible to us whenever the sun shone upon them—the same as a hemisphere would present a bright point when viewed from any direction, hence the question of their solution resolves itself into an optical problem.

Now, all light reflected from polished surfaces, such as glass, water, etc., has the appearance of starlight. If they are sheets of water, they will have their surfaces horizontal, and could only be seen by an observer at the earth when the sun was in such a position that its ray would be directed by the surface on to the particular spot occupied by the observer, and at the exact moment of his observation. Owing to the rapidly-changing position of the three bodies, the reflected ray could only remain in the telescope for a few minutes when the spot, though still in the telescope and steadily watched by the observer, would cease to sparkle, because the surface of the lunar lake had ceased to subtend to the position of the sun and the observer the required angle of incidence and reflection, and, though that point upon the moon's surface may be watched with the greatest care during every subsequent lunation, yet it may never again be seen to sparkle by an observer situated at the same place, because the track of the spark across the earth might never again pass through that point of observation.

When these sparkles pass out of the telescope, the spots which emit them turn dark, and are usually described as "shadows," which they cannot be, as there are no corresponding elevations to cast shadows, therefore the changes must be due to the fact that they reflect the dark field of the sky, which takes the place of the sun as soon as that body moves from the particular position from which its light was reflected into the telescope.

The plain of Mare Crisium is sometimes seen to sparkle with minute spots and streaks of light. Now, if it were a sheet of water, we would have a broad reflection from its surface whenever the sun and some fortunate observer sustained to each other and to the reflecting surface the required angles of incidence and reflection. Small sheets of water distributed over the plain would represent sections of a broad sheet, because the surface of all would be alike horizontal, and would, therefore, make their appearance to an observer upon the earth all at the same time, just as they would have done with the rest of the surface had they been portions of a great sheet; hence their appearance and disappearance all together demonstrates that they are horizontal reflecting surfaces. "It would be difficult to say," observes Webb, "why, if these are permanent, they are so seldom visible." Their permanency is established by the fact that they always reappear in the same places, but their reappearance at the same points upon the earth's surface is no more to be expected than that

of a total eclipse; indeed, not so much, because in the latter case the great size of the moon would make a small error imperceptible, but, in calculating the path of a mere spark across the earth, a very small error would be fatal to the success of the reobservation. The realization of the calculated reappearance of those starlike points of light at certain periods and certain places will open a new chapter which may teem with important revelations to the science of astronomy.

The assertion that spectroscopic analysis demonstrates the absence of water from the lunar surface merely proves that the functions of the spectroscope are sometimes misunderstood, as it is not moonlight but reflected sunlight which comes to us from that body, hence the impossibility of gaining any knowledge of the physical nature of our satellite by the aid of that instrument.

No vapor could ascend an inch above the surface of our own earth if there were no atmosphere; therefore, the white clouds which have so often been observed above the small lunar basins, demonstrate the existence of a lunar atmosphere, and all photographs of solar eclipses show a very distinct halo projecting from the dark disk of the moon over the luminous surface of the sun, and, as no such halo projects in upon the disk of the sun from the dark field of the surrounding sky, it follows that the halo is due to some refracting medium surrounding the moon, which must be substantially an atmosphere.

CHARLES B. BOYLE.

OUR BOY.

WILLIE has had eleven years' experience of life, and has been allowed to develop according to Nature. This good dame is said to be bountiful in her law of compensation, and will probably bring to our boy some great good later in life, to balance the numberless ills to which all boy-flesh is heir. I have adhered to the theory, that much government of youngsters is hurtful, unless they happen to come of a bad stock, and I have been content to lay no other burden upon Willie than the prohibition of lying, which law is understood to be inflexible and eternal. Of course I am obliged to expostulate, ever and anon, as some new and startling development of boy-nature is manifested, but I have never had to inflict punishment, and do not often administer reproof. I paid him fifty cents in silver, some years ago, for his promise "not to shoot off matches in the house," and I keep my powder-horn locked up. I think he groans inwardly, under the sense of disability he bought with that half-dollar, but he adheres to the contract manfully. The powder-horn was locked up, because I found him, on the last national anniversary, behind the kitchen, trying pyrotechnical experiments. He had abstracted a coal from the range, and was pouring a steady stream of powder upon it. The experiment failed, because the coal was extinct. There is certainly a special Providence hedging about a boy's life, whatever may be the truth of the doctrine beyond the adolescent period.

I spent an entire day at home, recently, and, it being Saturday, Willie was at home also. It occurred to me that a good opportunity was here presented to investigate the manners and customs of the animal boy in his native state. He had conquered his lessons on Friday night. I overheard him reciting to himself his geographical studies, which appeared to be a list of provinces in Hindostan. He covered the page with his hand, while he sung out his "jography" in this fashion: "Scinde, Agimeer, Delhi, Agra, Allahabad, Dicksloo, Allogoslum, Hulker, Pulker, Peelersgum, Francis!" In looking over the book afterward, I could not find all these provinces set down. He was equally accurate in his task in syntax, making strange confusion with the rule and the example. He rattled the grammar-lesson off glibly, thus: "A word is a verb which signifies to be, to do, or to suffer—as—(Example) a woman, a duck, a hen!" However, he went to bed satisfied, and slept the sleep of the just.

At breakfast on Saturday the young gentleman appeared with his ordinary shining morning face. I am not entirely satisfied that the rigid adherence to our rule of matutinal ablutions is according to Nature. Willie goes through the ceremony every day, but he has once or twice plaintively wished that he were a horse, so that he could be "cleaned off with a curry-comb, like pony." Perhaps there is in boys a latent hydrophobia, which is checked and controlled by these diurnal inflictions. Anyhow, the custom is time-honored, and I do not like to introduce innovations, so Willie has to submit to the daily scouring. With carefully-arranged hair, polished face, and

clean attire, our boy is pretty well disguised when he appears at the morning meal, but he grows into his normal condition before the day is old.

He commenced the day's regular operations by falling, head-foremost, down the main staircase, starting with a pitcher of water, and reaching the bottom with the pitcher-handle in his grasp. He turned over twice or thrice during the transit, striking his head against the wall and balustrades with violence sufficient to brain half a dozen men, and when he got to the bottom howled dismally. He was dried and comforted (I gave him a greenbacked dollar, and promised him a new four-bladed knife), and I think he was a good deal refreshed by the exercise. He felt that the day was begun. The fragments of the shattered crockery were gathered up, and the innocent little darling was once more turned loose upon the world. There were two or three new phrenological developments on the surface of his cranium, but no new manifestations of character. The organ of benevolence was very materially enlarged by the contact with a thick oaken baluster, for I saw him ten minutes later twisting the cat's tail until she sneezed and yelled hideously. She escaped at last, and took refuge in the cherry-tree. Of course, this could only be a temporary relief. In half an hour she was stoned out, and fled across the yard, and over the fence, with her ordinary tail multiplied by three, in diameter, and with a back that surpassed the most astounding Grecian bend I ever saw on Broadway.

From the window of my library is visible the larger part of Willie's usual *habitat*, and during the day he furnished me many opportunities for investigating his habits. He is proprietor of the most extraordinary "dorg" that I have yet encountered, and, in the present condition of the quadruped, it would be difficult to assign him his proper place in the canine family. His ears have been scalloped on one side, and cut into points on the other. His caudal appendage has been shortened to an inch. This curtailment was effected under Willie's directions, when Sneak, that is, the dorg, was caught in the act of egg-sucking. Thus shorn of his fair proportions, Sneak is still a dog of parts. His master has taught him to go lame in one leg, to sit up on end and "beg," and to haul his wagon about the yard. So, when I heard the clatter of Willie's wagon under my window, and his stentorian orders to his "team," I peeped through the blind to study his equipage. To my intense astonishment he was driving double. Sneak was on the off-side of the pole, and a pet Berkshire pig on the other. They were harnessed with twine, eked out by bits of old bridles for traces. It was evident, at the first glance, that the porker was not well broken. He was balky and obstinate, and Willie had his hands full. The dorg-horse was kind and gentle, and wagged his absurd stump of a tail vigorously, even while sorely perplexed by the erratic course of his "match." I foresaw the catastrophe, which came in due time. Piggy bolted, tore himself and the vehicle clear of Sneak, and galloped off to the stable, scattering the fragments of the wagon to the right and left. It was a regular smash-up.

At noon, Willie came in to luncheon. The regulations at this repast only require clean hands and face, and large liberty in the matter of attire is granted. Our boy's habiliments were somewhat the worse for wear and tear, but his digestive powers were unimpaired. The quantity of bread and butter, cold beef, and cake, that he put out of sight would have kept a small family of adults a week. I inquired into the results of the "runaway," expecting a doleful complaint of loss; but Willie assured me that the damage was inconsiderable. "I got that wagon last Christmas, pa," he observed, "and it was 'most broke anyhow." I then asked if he was satisfied with the result of his attempt to train piggy, and received a reply in the negative, very promptly. "I'll fix piggy," he remarked, "after lunch." The young gentleman did not seem at all disconcerted, and I felt that he might be safely left to his own resources.

My neighbor is a very enterprising market-gardener, and probably a valuable member of society, but our intercourse is limited to purely business transactions. He also is the possessor of a boy, a few years older than Willie, and far more advanced in worldly knowledge. I have had a lurking suspicion, for some time, that this youth, whose name is Dicky, is not precisely the associate I would select for Willie, and have consequently rather discouraged their intercourse. Dicky does not trespass on my premises very frequently, and the colloquies betwixt the boys are usually conducted through the partition fence. When I saw them together at the stable, after luncheon, I was tempted to call my boy into the library, and sacrifice an illustrated

volume to his entertainment. Before I acted upon this impulse, the *dénouement* arrived.

An unusual uproar, a mixture of yells, squeals, and grunts, drew me to the window, and I saw Willy astride of piggy, who was goaded into a gallop by Dicky and a sharp stick. Piggy had been indulging in a luxurious wallow, and his coat was not at all nice, but Willie was not particular. He sat his gallant steed with the air of a centaur, his knees claspings the reeking sides, one hand grasping the off ear, and the other waving in triumph over his head. Dicky faithfully performed his duties, and poked his stick into ham and shoulder industriously and mercilessly. The porker doubled at short angles, evidently trying to unseat his rider, who clung to him with the tenacity of death. At last, the trio came down the path by the garden, with the sweep of a tornado. Willie was dashed against the palings, and the tortured pig escaped. The last I saw of him was the curl in his tail, as he tore out into the main road, hotly pursued by Dicky.

No bones were broken. Our boy was bathed and dressed for dinner in due time. I looked at him that night, as he lay in his crib, rosy and serene in peaceful slumber, and marvelled that his small body could contain so large a quantity of what is commonly called the devil.

A. JONES.

UNDERSONG.

LATE—soon or late,
The longest day hath end;
If the summer wait,

The winter still must wend
With sad steps and slow unto the fields of Fate.

In the frozen wail
Of the wintry wind,
Like a joyous tale
From fair lips and kind,
Sound the sweet forebodings of the summer gale.

Though the wasteful snow
Lieth wide and deep,
Spring shall come and go;
Night is more than sleep—
From the night and winter brighter things shall grow.

Storm and sun are born
Of an equal birth;
Day that knew no morn,
Joy that hath no dearth,
Were but things to make our sweetest thoughts forlorn.

Starry wonders swing
In their ceaseless round—
Were the night a thing
Thought had never found,
Vain were all the songs the stars of morning sing.

Tears were made for men,
Joy was made for tears;
Hope is hopeless, when
It hath no human fears—
Love is dead that lieth all within our ken.

Nations are but things
Born from death of nations;
Great rejoicing springs
Best from lamentations—
Death is Life, if there a new creation clings.

Peace hath root in wars—
Its ripe fruits are battles;
Desolation mars—
The loud thunder rattles,
But the bow of peace still sits among the stars.

L. BRUCE MOORE.

TABLE-TALK.

ONE of our city journals, which habitually pays much attention to the leading topics of scientific and intellectual discussion, lately gave its readers a lively sketch of the last results of Darwinism in an account of the coming man, that is to say, of man as he will be in the future when the great Darwinian principle of natural selection has perfected its work, and the process of evolution, or development, has been carried on for a million years or so. The account professes to be based on disclosures of Mr. Darwin's private views and speculations made by an intimate friend of the philosopher now in this country on the staff of the English High Commission. This imaginary disciple of the great master is made to represent that the chief agent in modifying the coming man will be his diet. Heretofore man has lived upon the vegetable and animal organisms by which he was surrounded. Fruits, plants, and animals, have been his diet. But is this necessary? Is it not possible that a food may yet be discovered which, while organic and susceptible of sustaining life, need not necessarily be embodied in any form of vegetable or animal life? In other words, may not synthetic chemistry come to our aid in supplying concentrated food which will replace the bulkier and grosser forms of vegetable and animal aliment? In fact, this is already being done. Immense strides have been made of late years in this direction. Even your grocer deals in extracts of beef and condensed milk and concentrated coffee, and the druggists are selling chemical food already in the shape of the syrup of hypophosphites. We now are beginning to learn of what chemical constituents our bodies are composed. This has been discovered for us by analytic chemistry, and, indeed, nearly all chemistry so far has been analytic. It has disintegrated—it has taken apart nearly if not quite all the materials of the universe about us. We now know pretty nearly of what every thing about us is composed, but synthetic chemistry is of comparatively recent origin, and consists of the putting together of the particles of matter about us and forming new combinations. It is now discovered that chemistry can give us organic matter without the necessity for its having gone through any form of organic life. Urea and a host of other organic materials can be made by chemists. There is no end to the possibilities of synthetic chemistry. Now, if in the waste of the human body we can find out the material necessary to repair that waste, clearly we are on the road to getting rid of animal and vegetable food. If the disintegration of our bodies is a matter of pure chemical decomposition, which is discoverable, and if it is possible to put materials together which will repair the waste of our bodies, why may not the chemist take from the inorganic earth about us such material as he needs, and supply what is required to the reformation of our systems? The German scientists have discovered that there is no thought without phosphorus, and so of all the material which goes to compose our muscles, nerves, bones, fat, etc., we are aware that they are built up

from certain constituents about us, and the supplying of those constituents will give us a food which will render unnecessary the slaughter of innocent animals and the eating of gross vegetable products. Eating will then be one perpetual delight, and there will be no more dyspepsia, because nothing will be taken into the system which the system may not appropriate. This will gradually work an important change in the human form. The man of the future, eating a food in which there will be no waste, will have less strain upon his abdominal regions. In time the stomach will shrink, the liver will become smaller, the intestinal canal will diminish and shorten, the kidneys will not be so active or so much used, and will hence decrease in size. The race of "pot-bellied" men, men of huge round paunches, will decrease and pass away, while a race with small abdominal regions, and with their organs of digestion reduced to a minimum, will take their place. At the same time the superior regions of the body—the lungs, and especially the brain—under the improved conditions which will exist when this food is being eaten, will enlarge very greatly. Whatever is used most will acquire a constant tendency to increase. As the powerful jaw and terrible neck of the lion are increased, generation by generation, while his stomach decreases by his habit of life, so, too, will the tremendous brain of the man, and his vast nervous energy, called into being by this new food, give us a race with huge lungs and of mighty brain-space. The brain will need great blood-vessels to give it strength, and these will create a necessity for deriving an unusual amount of oxygen from the air. In short, the man of the future will have a shrunken belly, a great breast and neck, and a mighty head surmounting all. He will also be without teeth, because he will have no use for them. And, as the infant of the future will be fed on artificial food chemically prepared for its best nourishment, great changes will take place in the female form, which it is not necessary to specify. It will be seen by those who have read "The Origin of Species" and "The Descent of Man," and have mastered the principles of Darwinism, that these speculations as to the man of the future are far more reasonable and plausible, and have much more of a real scientific basis, than Mr. Darwin's theories as to the man of the past. It is but the first step that costs, and, if we admit at all the theory that natural selection rules the universe instead of God, we need not be startled or shocked at any lengths to which it may carry us.

— Lord Brougham's autobiography, written at the age of ninety, has just begun to be published, the first of the three large volumes of which it consists having been issued in England. So far, the work is kindly and modest in tone, without any trace of the asperity which Brougham was wont to exhibit toward his opponents, and with little of his characteristic egotism. As the work of a man of such great age, it is surprisingly vigorous in thought and style. It contains some curious anecdotes of life in Scotland at the close of the last century. Among others, for instance, he quotes a letter which he wrote

from Stornoway, in 1799, in which he states that he and his companions are uniformly dead drunk at night. On one occasion, four of them drank twelve bottles of port at a single sitting, of which Brougham drank four and a half bottles. During his university life at Edinburgh, after working hard at their studies all day, he and some of his fellow-students—all of them youths of good families—would assemble at what we should call an oyster-saloon, or at the Apollo Club, where the orgies were more of the "high jinks" than of the calm or philosophical debating order. "Sometimes," he says, "these nocturnal meetings had endings that in no small degree disturbed the tranquillity of the good town of Edinburgh. I cannot tell how the fancy originated, but one of our constant exploits, after an evening at the Apollo, or at Johnny's, was to parade the streets of the New Town, and wrench the brass knockers off the doors, or tear out the brass handles of the bells! No such ornaments existed in the Old Town; but the New Town, lately built, abounded in sea-green doors and huge brazen devices, which were more than our youthful hands could resist. The number we tore off must have been prodigious, for I remember a large dark closet in my father's house, of which I kept the key, and which was literally filled with our *spolia opima*. We had no choice but to hoard them, for it is pretty obvious we could not exhibit or otherwise dispose of them. It was a strange fancy, and must have possessed some extraordinary fascination; for it will be scarcely credited, and yet it is as true as gospel, that so late as March, 1803, when we gave a farewell-banquet (I think at Fortune's Hotel) to Horner, on his leaving Edinburgh forever to settle in London, we, accompanied by the grave and most sedate Horner (*ætat.* twenty-five, or, to speak quite correctly, twenty-four years and seven months), sallied forth to the North Bridge, and then halted in front of Mr. Manderson the druggist's shop, where I, hoisted on the shoulders of the tallest of the company, placed myself on the top of the doorway, held on by the sign, and twisted off the enormous brazen serpent which formed the explanatory announcement of the business that was carried on within. I forget the end of the adventure; but I rather think the city-guard exhibited unusual activity on that occasion, and that we had a hard run for it." Lord Brougham says that his father was very fond of telling the following ghost-story: "He had been dining in Dean's Yard, Westminster, with a party of young men, one of whom was his intimate friend, Mr. Calmel. There was some talk about the death of a Mrs. Nightingale, who had recently died under some melancholy circumstances, and had been buried in the abbey. Some one offered to bet that no one of those present would go down into the grave and drive a nail into the coffin. Calmel accepted the wager, only stipulating that he might have a lantern. He was accordingly let into the cathedral by a door out of the cloisters, and there left to himself. The dinner-party, after waiting an hour or more for Calmel, began to think something must have happened to him, and that he ought to be looked after. So my father and

two or three more got a light, and went to the grave, at the bottom of which lay the apparently dead body of Mr. Calmel. He was quickly transported to the prebend's dining-room, and recovered out of his fainting-fit. As soon as he could find his tongue, he said: 'Well, I have won my wager, and you'll find the nail in the coffin; but, by Jove! the lady rose up, laid hold of me, and pulled me down before I could scramble out of the grave.' Calmel stuck to his story, in spite of all the scoffing of his friends; and the ghost of Mrs. Nightingale would have been all over the town but for my father's obstinate incredulity. Nothing would satisfy him but an ocular inspection of the grave and coffin; and so, getting a light, he and some of the party returned to the grave. There, sure enough, was the nail, well driven into the coffin; but hard fixed by it was a bit of Mr. Calmel's coat-tail! So there was an end of Mrs. Nightingale's ghost. This grave afterward became remarkable for a very beautiful piece of sculpture, by some celebrated artist, representing Mr. Nightingale vainly attempting to ward from his dying wife the dart of death."

— A correspondent sends us the following note, the correctness of which we see no reason to doubt: "Among the miscellaneous articles of the last number of the JOURNAL you speak of the great gun recently cast at the Royal Arsenal in England as being the largest in the world. This is a mistake. There is a gun at Fort Hamilton, Long Island, that far exceeds the English gun in size and weight. It weighs one hundred and sixteen thousand five hundred and forty-nine pounds, which is over fifty-eight and a quarter tons, while the English gun weighs but thirty-five tons. It carries a ball of one thousand pounds' weight; the English gun, a shot weighing but seven hundred pounds. Its service-charge is one hundred pounds of powder, which can be increased to one hundred and fifty. It is twenty feet in length, and is capable of propelling a ball to a distance of three miles. I think this beats the Englishman considerably." There is, however, still a larger gun, of Krupp manufacture, owned by the Prussian Government, which was at the French Exhibition, and which, according to a recent article in the *Gartenlaube*, throws a solid steel shot weighing eleven hundred Prussian pounds, encased in two hundred pounds of lead.

— The article on "The Scenery of the Moon," in our present number, is by a scientific gentleman of this city, who has made our satellite a special study for many years, with the aid of a good telescope. It will be seen that he comes to conclusions very different from those entertained by the astronomers who regard the moon as a "dead planet," utterly devoid of air and water—the great essentials of life. He thinks there is evidence of the presence of water, and also of air, though the atmosphere is undoubtedly scanty, compared with that of the earth. He is also confident that signs of vegetation can be discerned. We have much confidence in the sagacity of our contributor, whose views, we know, are based on long and careful observation, and whose descriptions of lunar scenery are not at all imaginary nor conjectural.

Literary Notes.

SOME excitement has been created in literary circles in Spain, by the announcement that a learned bibliophile, Don Fabian Hernandez of Santander, proposes to publish a new edition of "Don Quixote." Señor Hernandez, states that he "has discovered the original of this immortal work, and avails himself of such discovery to reproduce it as Cervantes penned it, freed from the corruptions of copyists, commentators, and printers." The specimens given by Señor Hernandez of his emendations, display much study and ingenuity, and indicate that the Santander edition will be one to raise the curiosity of all students of "the great book of the one-handed hero of Lepanto."

At the sitting of the 30th of January, the French Academy learned the death of M. Gustav Lambert, who was engaged in preparing an expedition to the North Pole when the war broke out, and who had been badly wounded at Montretaut when fighting at the head of a company of National Guards which he commanded. M. Elie de Beaumont read a memoir sent four years ago by the enterprising intended explorer. Before leaving Paris for his last fight, he had sent to the *Défense Nationale* a memoir on the means of communications between Paris and the Provinces.

Prince Pueckler-Muskau, who died the other day at the ripe age of eighty-six, at his splendid estate near Cottbus, left a very singular will, in which occurs the following passage: "As for my cash, I believe there is little left of the millions which I received during my long life. My steward knows more about it than I. My heirs will confer a favor on me if they will use part of that money for buying up all the copies of my works which they can find, and destroying them."

The *North British Review*, after a checkered existence of five-and-twenty years, ends with the current number. It was started by the Free Kirk, and died in the hands of the liberal Roman Catholics who conducted the *Home and Foreign Review* and the weekly newspaper, the *Chronicle*. Like the latter, it is said to have been killed by the hieroglyphs which adorned its pages.

"Recollections of the Public Career and Private Life of the late John Adolphus," the well-known barrister and historian, with extracts from his diaries, by his daughter, Mrs. Henderson, widow of the late Captain Andrew Henderson, is announced for publication in London.

The literature of the war will be voluminous, and let us hope that much of it may have a title to permanent interest. Among volumes forthcoming are "A Journal of the Siege of Paris," by the Hon. O. Bingham, and "Lucie's Diary of the Siege of Strasbourg," by a young lady of Alsace.

Goldschmidt, the Danish literary critic, says, in the last number of his review, that few Danish authors have ever received two hundred dollars for any book of theirs. So limited is the sale of Danish books that the first edition of any work rarely exceeds five hundred copies.

Scribe's widow is very wealthy. She receives over thirty thousand francs a year on the copyrights of her husband's plays. The *libretto* of "L'Africaine" alone has hitherto yielded her nine thousand francs.

In July next the Crown-princess of Prussia will publish her book on "Female Labor," which has been in print for several years, but for some reason or other withheld from publication.

Alphonse Karr, the famous French author, has lost his whole fortune by unsuccessful horticultural speculations, and now ekes out a somewhat precarious living by writing articles for the newspapers.

Maurice Sand, George Sand's son, has nearly completed a book entitled "La Honte de la France," which is said to contain highly-interesting disclosures about the secret history of the second empire.

Thiers's works have suddenly become more popular than ever in Europe. New editions of them are advertised in Belgium, Germany, Italy, and Spain.

A life of Washington Irving, in German, by Adolph Laun, a popular writer, has been published in Berlin.

Mr. Arthur Helps has collected and revised his "Conversations on War and General Culture," for immediate publication.

The death is announced of Jacob Venedey, well known in Germany as a writer on political and historical subjects.

Dr. Magee, Bishop of Peterborough, has a volume of sermons on "Modern Infidelity" in preparation for the press.

Among recently-published translations from the English into Russian, we notice one of the "Leviathan" of Hobbes, by Seraphin.

In the year 1870 eight hundred and forty-one novels were published in Germany, over half of which were written by ladies.

A complete translation of Shakespeare's plays into modern Greek, in twenty small volumes, has recently been published in Athens.

Holme Lee and Hamilton Aidé have each a novel in the press.

Dumas left the unpublished manuscripts of twenty-three novels and fourteen plays.

Edmond About has been engaged to write for the London *Telegraph*.

Scientific Notes.

The Fuel of the Sun.

A RECENT English writer, W. M. Williams, in an astronomical work on the fuel of the sun, argues that all space is filled with an ether or atmosphere of which what we breathe is only a condensation produced by the attraction of the earth. All the planets and stars attract their own atmospheres from this general atmosphere in which the globes float and move like fish in the ocean.

Mr. Williams calculates the pressure of the sun's atmosphere upon any given area of his surface as equal to the pressure of fifteen thousand two hundred and thirty-three earthly atmospheres. Those figures are only approximate, but are under rather than overstated, because any estimate of the diameter of the body of the sun must be of a most hypothetical and doubtful character. Putting together and comparing the various descriptions of different observers, there are good grounds for concluding that the real body of the sun has never been seen at all.

The most important result, our author infers, of such a vast accumulation of solar atmosphere, is the evolution of heat which must be produced by the compression of the lower strata. If the pressure that can be exerted by the human hand upon the piston of a condensing syringe is capable, in spite of the surrounding conductors, of producing sufficient heat to ignite a piece of German tinder, what must be the consequence of the enormous pressure of this vast atmosphere!

Now, all the records of human observation indicate that, during the historical period, no sensible increase or diminution of the solar light and heat has occurred; and the incomparably older records of geological history point to the same conclusion. No theory of the sources of solar heat and light can be sound which fails to explain this degree of permanency. There also exists in the human mind an almost irresistible *a priori* belief in the permanency of the universe, which is usually strongest in those who have the most deeply studied its mechanism. A further examination shows that no extinction of the sun—even at the remotest conceivable period—no gradual diminution of his energies, need be feared; but that when once a certain normal amount of radiation has been attained, it will be maintained eternally both by our sun and by all the other suns that are surrounded by dependent planets. The fresh supply of fuel is supplied by the progressive motion of the greater orbs and the reacting gravitation of their attendant worlds. The process is assumed to take place in this wise:

Our sun is travelling through space with a velocity which has been computed at from four to five hundred thousand miles per day. Now, if the hypothesis of a universal atmosphere is correct, the sun must, of necessity, encounter some resistance in his passage through it. This resistance will obviously be applied to the outer regions of his atmosphere, which, being fluid, will yield to such resistance, and a portion will be left behind. But the sun will obtain his share of the general medium, which of course will be obtained from that portion of space into which he is progressing.

Let us now see what will be the amount of the fresh fuel thus supplied to the sun. The daily supply will be equal in bulk to the contents of a cylinder having a diameter equal to that of the sun and his attendant atmosphere, and whose length is four or five hundred thousand miles. Taking this diameter at nine hundred thousand miles, and the length of the cylinder at four hundred and fifty thousand miles, its cubic contents will be 286,278,300,000,000,000 cubic miles. Mr. Williams assumes that the inter-stellar atmosphere has a density of only one hundred-thousandth part of that of our atmosphere at the level of the sea. A cubic mile of such rarefied air would weigh rather more than fifty tons. The total weight of the daily cylinder of fresh fuel will thus be in round numbers one hundred and sixty-five millions of millions of tons per second.

But the furnace of the sun, like our humble furnaces on earth, requires not only a continuous supply of fuel, but a stoker to feed and stir it. Now, the planetary attendants of the sun perform this duty with untiring vigilance and efficiency. The actual effect of planetary gravitation on the sun is to produce a disturbance of the kind required, although in a most irregular manner. The planetary motions are so complex, and their relative positions are so perpetually changing, that the position of the general centre of gravity, in relation to the mass of the sun, is never the same for two consecutive seconds. In all probability, the greater portion of the bulk of the sun consists of gase-

ous matter, and the "nucleus" is only a comparatively small kernel in the midst of the gaseous mass. These forces, therefore, are quite sufficient to produce an enormous amount of disturbance in the solar atmosphere—a complication of clashing tides, and the consequent formation of mighty maelstroms, vortices and cyclones, hurricanes and tornadoes, of fury inconceivable to the dwellers upon this comparatively tranquil earth. Whether we regard the nucleus of the sun as reeling irregularly in the midst of his profound fluid envelope, or his atmosphere as dragged here by Jupiter, there by Venus, hither by the Earth, thither by Saturn, and everywhere in the mean time by the vivacious Mercury, we cannot fail to perceive in planetary attraction an agent for perpetually stirring up and mingling together the various strata of the solar atmosphere. By means of this agency, the vigorous and newly-arriving fuel must be whirled into the midst of the sun's photosphere, while huge upheavals of thermally-exhausted matter must find their way again to the upper regions of the rarefied atmosphere, where that matter will be cooled by re-expansion below the general temperature of the inter-planetary medium, and then swept round and carried into the wake of the sun.

That an actual connection between the disturbances of the solar atmosphere and the position of the planets does exist, is shown by the observations of Mr. Carrington, who finds that the varying distances of Jupiter affect the development of spots, which are more abundant when this planet is farthest from the sun. M. Rudolph Wolf, of Bern, has observed that, besides the well-known period of a little more than eleven years, there is also another period of maximum spot-development of about fifty-six years, which Mr. Balfour Stewart has shown to correspond very nearly with the epoch at which Jupiter and Saturn come to aphelion together.

Mr. Grove, in his inaugural address to the British Association, 1866, propounded the following questions: "Our sun, our earth, and planets are constantly radiating heat into space; so in all probability are the other suns, the stars, and their attendant planets. What becomes of the heat thus radiated into space? If the universe has no limit—and it is difficult to conceive one—there is a constant evolution of heat and light; and yet more is given off than is received by each cosmical body, for otherwise night would be as light and as warm as day. What becomes of the enormous force thus apparently non-recurrent in the same form? Does it return as palpable motion? Does it move, or contribute to move, suns and planets?"

Mr. Williams thinks he may venture to answer those questions, having shown that the heat thus radiated in space is received by the general atmospheric medium; is gathered again by the breathing of wandering suns, who inspire, as they advance, the breath of universal heat, and light, and life; then by impact, compression, and radiation, they concentrate and redistribute its vitalizing power; and after its work is done, expire it in the broad wake of their retreat, leaving a track of cool exhausted ether—the ash-pits of the solar furnaces—to reabsorb the general radiations, and thus maintain the eternal round of life.

high honors in 1844. After the February revolution in 1848, he became Lamartine's secretary in the Department of Foreign Affairs. Bastide, some time afterward, offered him the mission to Rio de Janeiro; but he preferred to remain in Paris as assistant editor of the *Evenement*, a journal founded by his father. For an article on the death-penalty, which created a great sensation at the time, he was sentenced to two months' imprisonment. Following his father into exile after the *coup d'état* of December 2, 1851, he lived most of the time in Brussels, where he wrote a number of pamphlets, and corresponded with several leading radical papers. His journalistic ability was very great. Thus, for instance, after Rochefort had fled with his *Lanterne* from Paris to Brussels, Charles Hugo, one day, when Rochefort was sick, wrote the whole paper, cleverly imitating Rochefort's style, and producing a better issue than the latter. In 1869 he returned with his brother François to Paris, and began the publication of the daily *Rappel*.

The Duke de Rivoli, grandson of Napoleon's celebrated marshal, was elected commander of a battalion of Franc-tireurs, formed at Nice, and sent with his men to the Army of the Vosges. When Garibaldi was appointed commander-in-chief of that army, the duke became very indignant, and declared at a coffee-house in Dole that he would not fight under Garibaldi. Several officers went to the latter, and urged him to send the duke before a court-martial. "Oh, no," replied Garibaldi; "if the Duke de Rivoli does not want to fight, let him go home." The duke's men, upon hearing this, immediately elected another commander, and he himself had to leave the town very precipitately, in order to escape personal violence.

A correspondent of the *Berlin Exchange Gazette*, writing from Coburg, asserted, some time ago, that Queen Victoria had been systematically deceived by people living in Coburg, who had solicited favors from her on the ground that they had been intimately acquainted with Prince Albert during his youth, and that most of her charities there had been bestowed upon unworthy persons. Some time afterward, the correspondent in question received a letter from the queen's secretary, in which he was requested to send specifications of his charges, so that the impostors might be prosecuted.

Jean-Jacques Offenbach, who has lost at least one hundred thousand francs by the war between France and Germany, has recently found out that misfortunes never come alone. His operettes are no longer performed in Berlin, Munich, and Vienna, where they were formerly very popular; and now the Turkish police, for some reason or other, has prohibited the representation of his "*Grande-Duchesse*" and "*Belle Hélène*" at Constantinople, Pera, and Smyrna.

A hundred thousand copies of the "Secret Correspondence of the Second Empire, found in the Tuileries," have thus far been sold in Paris. A curious fact is, that the seven letters written by the Empress Eugénie, which this collection contains, are full of gross orthographical blunders.

Queen Maria Pia of Portugal, Victor Emmanuel's daughter, it is said, intends to leave her royal husband and return to her father. It has been generally known at Lisbon, for some time past, that the king treats her with brutality, and has even frequently struck her with his cane.

Foreign Items.

CHARLES VICTOR HUGO, Victor Hugo's son, who died the other day in Paris, was born in the year 1826, and educated at the Charlemagne College, where he graduated with

It is now authoritatively stated that neither Prince Richard de Metternich nor M. de Lesseps, as was at first reported, assisted the Empress Eugénie in her flight from the Tuileries. The only person who helped her to escape from Paris was Dr. Evans, the American dentist.

All the statues erected to the heroes of the second empire in France have been destroyed. The metal of the equestrian statue of Napoleon III. was used at the cannon-foundry in Paris; and Morny's statue at Trouville, and Billaud's statue at Nantes, were simply destroyed.

Every German family whose head was killed during the war with France will receive, out of the indemnity-fund paid by France, the sum of one thousand thalers, besides the regular military pension.

The last descendant of the celebrated Thérèse Cabarrus, who played so conspicuous a part in the first French Revolution after she had married Tallien, died, a few weeks ago, of wounds received at the battle of Beaumont.

Verdi, the Italian composer, is such a spendthrift that, despite the large copyrights which he has received for his operas during the past twenty years, he is said to be quite poor.

The city in Europe which has the smallest number of daily papers in proportion to its population is Moscow. Only four dailies are published there, and only one of these four has a respectable circulation.

The Empress Augusta and the Crown-princess Victoria, during the war, broke to nearly one thousand persons the sad news that relatives of theirs had been either killed or dangerously wounded in France.

The famous publishing-house of Mame & Co., at Tours, has lost upward of a million francs by the suspension of its operations for about five months.

Jules Valles, who formerly defended the *coup d'état*, and was one of the most abject flatterers of Napoleon III., is now editor-in-chief of an ultra red-republican journal.

Five sonatas, written by Mozart, and which have never been published before, were found, the other day, at the Episcopal Library in Salzburg.

All of Mazzini's relatives are in very humble circumstances. His niece keeps a small fruit-store in Genoa, and one of his nephews has a private school in Syracuse.

Urbano Rattazzi received, the other day, for conducting an important lawsuit, a fee of fifty thousand lire, said to be the largest paid to an Italian lawyer for many years past.

One hundred ladies of Colmar have signed a pledge to wear mourning until Alsace is restored to France.

They say, in Madrid, that King Amadeo's favorite amusement is playing whist with his three Italian adjutants.

The last balloon sent from Paris, previous to the capitulation, was, strangely enough, named Cambronne.

Eckmann-Chatrion lost part of their library during the bombardment of Phalsbourg.

Miscellany.

Japan.

THE three thousand eight hundred and fifty islands that make up Japan bear a population of about thirty-four millions; the greater portion is a simple peasantry, whose principal occupations are agriculture and fishing, and who are no better than serfs. They subsist on the mere necessities of life; every thing else they produce being the right of their lords the daimios, the wealthiest of whom is said to have a revenue of three or four million dollars a year. There is no middle class in the country districts, and feudal Europe may be seen over again in the castles and the miserable towns and villages that cluster around them at a respectful distance. The lowest outcasts of Japan are the "Christians," the tolerated descendants of the native Christian families who were not quite destroyed in the great persecutions of the seventeenth century. They are condemned to the extreme degree of legal infamy, penned within walled towns in a quarter like the Jews' Ghetto of the middle ages, even in a prison when they are not numerous. The police watch them till their last sigh is drawn, and remove and secretly dispose of their bodies, lest Christian rites should be held over their remains. It is at least a curious fact that the Japanese Genesis admits a Trinity and incommensurable periods of millions and millions of years during which the generation of the world proceeded. The historical era commences in mist about six hundred and sixty years before the Christian era. It is impossible here to enter into Japanese history, but we may give a few of the dates. In the third century of our reckoning posting was established, and saki (rice-beer) introduced; in the fifth, silk was first made; in 543 "the wheel which shows the south" was sent to the Mikado from the court of Petsi in Corea, and in the seventh century coal was found.

M. Humbert, Swiss ambassador to Japan, says that the Japanese scenery frequently recalls the Swiss, and adds that the Japanese who travel tell him that no country reminds them so forcibly of their own as Switzerland. In some of the narrower channels between the numerous islands there is a great resemblance to the Rhine above Boppard; but there is one large engraving of a landscape in Southern Nippon which is exceedingly like hundreds in middle Germany, while another in the same district is quite an English woodland scene. As to the climate, the atmosphere is perhaps the most transparent in the world; the brilliancy of the sky is incomparable, and the air is pure and fortifying. Of all the countries of the extreme East, Japan, in its middle region, the south of Nippon, Sikoff, and Kiouliou, is the country which pleases and suits Europeans best. Earthquakes are frequent in the hot season, but they cause no disasters.

Although the first Europeans that landed in Japan (in 1542 and 1545) were the Portuguese, who had a factory in 1611 at Firado, the Dutch have had most influence. In 1611 the Netherlands East India Company obtained a concession, and soon after discussions between the colonists arose, and the Japanese began anew to persecute the Christians. The Portuguese were ejected between 1635 and 1639 with the aid of the Dutch, who were established in their place after the massacre of thirty-seven thousand "Japanese martyrs." From that time until 1854, Japan was closed to all other Westerns. Dutch is the language of diplomatic relations with strangers, and, more ex-

traordinary still, is the tongue in which military drill is carried on.

One of the fundamental differences between our ways and those of the Japanese is that their domestic life is passed on the floor. We stand and walk on it at intervals, while the greater portion of our indoor time is passed on furniture. But the Japanese sit, and eat, and lie on the floor, and their furniture, both as to height and amount, is toned down to this habit; their tables are enlarged stools; their fires are not fixed, but are taken about in braziers; the eternal tea-kettle rests in a little *papier-maché* vehicle like a housemaid's box, somewhat larger than the similar one (all over drawers and nooks) which forms the *nécessaire* of these ceaseless smokers of microscopical metallic pipes. This also explains the leaving of the shoes at the door; the place, if not holy, must be kept clean, and besides, is luxuriously soft, the floor being constantly covered with yielding mats of rice-straw four inches thick and very carefully made. Besides being a carpet, a tablecloth, and a sofa, this mat is also the mattress on which the bourgeois passes the night, wrapped in an ample bedgown and a large wadded quilt, with most frequently only a billet of wood under his head. This system is, however, very favorable in the struggle for existence to what the French euphoniously call the domestic kangaroo. But all this applies only to the bourgeoisie. The manners of the nobles are not seen by Westerns. In fact, in Yeddo there are two distinct societies in presence of each other; the nobles, armed and privileged, are secret and retired, being almost self-imprisoned, as in immense citadels, while the lower classes, open as day, full of *bonhomie* and cordiality, appear to enjoy perfect liberty while completely subject to the iron rule of the nobles.

Every man carries about writing-materials, a brush, a stick of Indian ink, and a roll of mulberry paper, side by side with his pipe and tobacco. Men and women employ different styles of writing, but the men can read the women's (*hirakana*) while the women cannot read the men's (*katakana*). The "callisthenics" of the ladies take the form of fencing with bent iron lances, but they do not know what needlework is. Books are respected equally with the monuments of ancestors. They are fond of periodically applying moxas, which parallels the former use of bleeding in this country. For this and for acupuncture, which is also a popular habit, there is a special class of surgeons. The bath, hot or cold, is universal, and the shampooers, who are in great request, are all blind. The ragmen in the streets pick up the waifs with long chopsticks. The wrestlers—some of whom are monsters—form a kind of tribe apart who improve in strength from generation to generation.

The House of Montmorency.

The sons of the house were fierce in battle, careless of life, indifferent to suffering, contemptuous toward the *canaille*, proud of bearing even toward their equals, ferocious persecutors, and superstitious in religion. But they were loyal and true, in word and deed; they ever held honor above all other considerations; they accepted the highest responsibilities as their right, and were only not ambitious because, from father to son, the highest honors were conferred upon them, almost as a matter of course. These qualities were handed down from one to the other, almost without change or diminution; and there was not one who can be called, in any sense, a *labes generis*. Some were unlettered; some more sanguinary than others; some of less ability; but, during all

their twenty generations, the same pride distinguished every one; the same contempt of things petty and mean; the same personal prowess; the same nobility; and the same "masterfulness."

The only noble house that can at all compare with them, in continued prosperity and personal distinction, is that of Douglas. No other can show any thing like the long list of honors boasted by the Montmorencys. From them have come six Constables of France, twelve marshals, and eight admirals. They have been grand-masters and knights of all the orders, grand-chamberlains and officers of the crown, and were for seven hundred years premier barons of France. Henry IV. declared that, in antiquity of descent, next to the house of Bourbon, must be placed that of Montmorency; their earliest known maternal ancestor was sister to an English king, their wives have been of royal blood, and their daughters have married into royal lines.

They have been a great fighting family. From father to son, they are all soldiers. In later times, when fighting was harder to get at, a few of them entered the church, of course with a view to becoming cardinals, for every thing done by a Montmorency must be conducted in the grand style, and with an eye to the dignity of history. And even in days, so sad for the historian of the grand style, when no nobleman was safe from the collector and retailer of gossip, very little was found to be told of a Montmorency which even a Robertson would be ashamed to repeat. It would almost appear as if every one of these great seigneurs was not only a hero on his horse, and with his marshal's *bâton* in his hand, but that he posed for posterity in *mufti*, and even, judging from the scanty records which remain of the family at bedtime, in his night-shirt. Some of the members of cadet branches, it is true, allowed themselves occasionally to relax from these sterner virtues; notably Gilles, of the Laval branch, one of the defenders in the famous siege of Orleans, who was made a Marshal of France for his valor, but was such a notorious criminal that they were obliged to hang him as an example. But these cases are rare.

Colonel Corvin.

Colonel Corvin, a German gentleman who has led a very stirring and adventurous life, has just published his memoirs, which are very entertaining. Here is one of his adventures: He was educated at the Prussian Military Academy, but, though he became an officer of the army, he was at heart a democrat, and in 1848 took part in a revolutionary movement against the Government of Baden. It failed, and he was compelled to surrender at discretion, and was at once arrested and put in prison as a traitor. Corvin's wife, a brave woman, had accompanied him, as many other wives had accompanied their husbands, on this expedition. Madame Corvin worked heaven and earth, as the phrase goes, forced her way into the presence of the Princess of Prussia, attacked Count Groeben, and was thrust aside as importunate. Before the surrender she was heroic enough to bid her husband "blow out his brains sooner than surrender to the Prussians." But she rejoiced that her advice had not been followed. When she saw him in his prison, she said: "If you must die, I know you will die like a man." At last his long-deferred trial came round. The Baden Government was dealing with him, yet the court was composed of Prussian officers and sergeants. Colonel Corvin made an eloquent speech of two hours in his own defence, but it was a foregone conclusion. He was found guilty, "by five voices to one,

condemned to be shot, and to pay the costs." As they drove away past the hotel of the place he heard a cry from a window, and a white hand was waved to him. He was thrust into the condemned cell. It was Saturday; and as no executions were allowed on Sundays, and Monday would be too long a grace, he knew he would be shot that night. About four hours then remained to him. Beside him was a little tumbled litter, from which poor Lieutenant Schad had risen that morning for his sentence. The jailer asked with a sepulchral voice:

"Would he have any thing, or see a clergyman?"

The reply was an order for a good dinner, a good bottle of wine, a dozen cigars, and writing-paper. His gallant wife now arrived. She had forced her way into the grand-duke's palace, but he would not see her. With an ingenious cruelty, all the princes, before the insurrection was put down, had divested themselves formally of the prerogative of mercy, and relegated it to the hands of the chief soldiers. When she got to the prison, they had the execution dinner served, which was furnished at the expense of the city. She had a little plan for his escape, but he refused to avail himself of it. They were then told that the execution was put off until Monday. So here was a grateful respite. Late at night, however, came the sound of many tramping feet, and two officers called him out to speak to him. She heard their whisperings. It was to tell him that all had been changed, and that he must be ready to be shot at half-past four in the morning.

She heard every word. They were to come for her at three. The agony of the interval may be conceived. The brave woman, however, knew that if she gave way, she would only unnerve him. He held her in his arms all the time: and the only thought that came upon her was, that what she felt so warm and living, would by five o'clock be cold, dead, and inanimate.

At three she was taken away. She knocked at the house of some friendly citizens. "They opened to me. After these good people had lain down again at my request, I stood at the open window alone, despairingly watching the coming morning, and listening to every sound. I felt as cold as stone, but I did not lose consciousness. The clock struck one quarter—half—three quarters—four! He has only one half-hour left to him. Then I heard the report of some shots—the people in the house heard them also—and I fell senseless to the ground, as if they had pierced my heart also." What a terribly dramatic picture!

The prisoner was quite composed, having faced death very often. He made his little preparations. At dawn he heard footsteps, and the mayor and officers entered.

"I am quite prepared, gentlemen," he said. "No, my friend," said the voice of the counsel who had defended him, "we bring you better news."

The honest lawyer had worked hard through the night; had gone to Carlsruhe and obtained a reprieve. Corvin's sentence was commuted, and he passed six years in penal servitude of the most terrible kind. He was at last released, though his health was utterly shattered, and has lived to write these entertaining volumes.

Eotvos.

In Baron Joseph Eötvös, who died in Pesth in the first week of February, at the age of fifty-seven, Hungary has not only lost the greatest prose writer she ever had, but also one of her noblest statesmen and parliamentary leaders. As an author, he is one of the few Hun-

garians whose works have become widely known beyond the limits of their country. His masterpiece, "*A Falu Jegyzje*" ("The Village Notary"), a novel in which charming pictures of real life and most touching scenes alternate with pages of the keenest satire directed against political abuses, and which greatly contributed to the almost complete overthrow of the feudal institutions of his country in 1848, is alone sufficient to secure him immortality. The "*Carthausi*" ("Carthusian"), however, his earliest production in the same field, and the historical novel, "*Magyarország 1514-ben*" ("Hungary in 1514"), are hardly inferior in merit; while his great study, "*Der Einfluss der Ideen des neunzehnten Jahrhunderts auf Staat und Gesellschaft*," published simultaneously in German and Hungarian, and a number of minor works on special reform questions, place him in the foremost rank of political writers. Nor was he less successful as a journalist and orator. Vying with Count Louis Batthyányi in the leadership of the liberal opposition in the Upper House of the Hungarian Diet before the Revolution of 1848, he at the same time, as a publicist, both defended and opposed Louis Kossuth, and subsequently became the colleague of both, as Minister of Public Instruction, in the cabinet of which they were the leading members. Shortly after the outbreak of the war, however, he resigned his position, and withdrew to Munich, where he was engaged in literary labors. After his return to his country, he was active in promoting its literary revival, aided by two distinguished friends, the historian Szalay, and the publicist Csengery. On the final restoration of the Hungarian Constitution, early in 1867, he became, in his former capacity of Minister of Public Instruction, a member of the Andrassy Cabinet, remaining till his death its strongest support, after Deák.

Change of Habits in Birds.

M. Pouchet says that the common swallow of Europe has modified the shape of its nest within fifty years. It is certain that many birds have changed their nest-building habits within an historical period. Some have learned to use thread in preference to grass. The common swallow and the chimney-swallow must have built differently before they had the use of eaves and chimneys. The old swallow-nests were globular with a very small rounded opening. The new nests are long and oval, and the opening is a long slit, four or five times as long as high, close to the top of the nest, where it meets the wall above it. This is an improvement on the old nest, as the young are not so crowded, and can reach out their heads for fresh air, while their presence does not impede the ingress of the parents.

What Women eat.

Another popular belief is that women eat nothing. It is, of course, conceded that they sustain life by the consumption of some article of nourishment; but eating, in the wholesale acceptance of the word, is supposed to be foreign to female nature. This fallacy is founded and sustained by women themselves, who, during the affected period of their lives, cultivate small appetites, as being *comme il faut*, and a sign of semi-angelic construction. When this pernicious nonsense is conscientiously carried out, the results upon the would-be angels are squalor, red noses, certain loss of vigor, general limpidity, and some other unpleasant *æquels*. But, as a rule, the smallest appetites at the fashionable tables are exhibited by those shrewd girls whose natural and healthy wants have been thoroughly appeased by secret stuffing. Need we refer our readers to the histori-

cal poem, concerning *Violante* in the pantry, gnawing of a mutton-bone, or remind them how she gnawed it, how she clawed it, when she found herself *alone*? All this is a direct deceit, however, practised upon unsophisticated old bachelors, who, when they have made the dainty creatures theirs, find out by the butcher's book and the ocular proof what sturdy trencher-women they have married. Watch a healthy girl at supper, during the intervals of dancing: she consumes by instalment four times as much as her partner, and seems, and is, none the worse for it. Our experience tells us that women eat, in proportion to their weight, as much as men, and are no more fairies in this respect than in the matter of weight.

Varieties.

THE reign of paper-money is now strangely wide. Russia, Austria, Italy, France, Spain, and the United States, six of the eight foremost nations in the world, have a legal-tender paper with a forced circulation. France and Spain are afflicted by numberless local currencies of no general acceptance. England and Germany alone, among the great powers, maintain a specie circulation, and recent events may well suggest a doubt whether, under disasters as trying as those which have lately befallen France, they, too, would not sacrifice their favorite theories to an apparent necessity or a temporary expediency.

It is worth while to bear in mind that if a person has swallowed poison, and no recognized antidote is at hand, the best thing to do is to give warm or cold water as fast as possible. Tepid water is the best, as that opens the pores of the skin, and causes vomiting, but, if that is not at hand, do not wait, but give cold until a physician arrives. While this will not cure all cases of poisoning, it will cure some, and benefit in all instances. But always produce vomiting as soon as possible.

An Irishman was sentenced to be hanged, and was just leaving the dock when the sheriff called him back and asked him his age. "Is it my age you want? Faith and I think I am about as old as I ever shall be," replied the doomed man. When the sheriff came to conduct him to execution, and his hands had been properly tied, he refused to walk. "Do you think that I'll assist at my own destruction? Do you think I'll walk to my death? If you want me, you'll have to carry me!"

An ignorant man, unable to read or write, has lately died in Cincinnati, leaving an estate of two hundred and fifty thousand dollars in steamboats and things. What a lesson this circumstance is to those who will fritter away their time learning to read and write, when they might be laying up steamboats for their heirs and assigns!

A miser, worth twenty thousand dollars, died in Knoxville, Illinois, recently from unintentional generosity. He drew a check of five hundred dollars, instead of five, to present to a nephew, and, when he found what he had done, he cried, "I am a ruined man!" and died from the effects of the shock.

Gotham Court, a building in New-York City, two hundred and thirty-four feet long, thirty-four feet wide, and five stories high, has a population of two hundred and sixty families, numbering twelve hundred and eighteen people.

A Persian manuscript of great beauty, containing sixty full-page miniature illuminations, and profusely ornamented in gold and colors in the highest class of ancient art, was recently sold in London for ten hundred and twenty-five dollars.

It is five years since nitro-glycerine came into use. The seventeen hundred persons whom it has killed or maimed for life, and the millions of property which it has destroyed, may be styled recommendations of its efficiency.

Many of the Parisians made arsenals of their houses. Abandoned flower-pots, broken bottles, and paving-stones, were stored in their dwellings to be shied at the conquering Germans when they should enter the city.

A sea-captain, invited to meet a committee of a society for the evangelization of Africa, when asked "Do the subjects of the King of Dahomey keep Sunday?" replied: "Yes, and every thing else they can lay hands on."

In Indianapolis a charming lady-physician was called to administer to a gentleman down with a fever. "You need good nursing," said the lady. "Nurse me for life," replied the patient. "I will," was the soft answer.

There are, in round numbers, about fifty-seven miles of wooden-block pavement in Chicago, and that city is, without doubt, the most thoroughly-paved city of its size in the world.

The danger of too implicitly trusting general statements or "doctrines of averages" is taught by experience; and the speculations of scholars, however ingenious, are often exploded by the logic of statistics.

Punch wants to know whether the Germans will care so much for the "Watch on the Rhine" now that they have got the great Strasbourg clock; and *Judy* asks whether the aforesaid watch is made of German silver.

The colored race in South Carolina is represented by three Congressmen, one Lieutenant-Governor, eleven State Senators, eighty State Representatives, and one Judge of the Supreme Court.

Arrangements are being made in Edinburgh to celebrate the one-hundredth birthday of Sir Walter Scott in an appropriate manner. He was born August 12, 1771.

The whole length of the Hoosac Tunnel now opened is thirteen thousand six hundred and twenty-two feet, which is little more than half through the mountain.

Of the forty-four professorships in Harvard University twenty-four bear the names of the individuals who founded them, or in whose honor they were designated.

In the five largest libraries in Paris are contained one million four hundred and fifty thousand volumes and eighty-seven thousand manuscripts.

A Bostonian visiting England, a short time ago, was inquired of in London "if the Indians in Boston worshipped at the same churches as the white residents?"

A writer in the *Christian Union* "fears that the pulpit does not get its fair proportion of the ablest men, as compared with the other professions."

A woman in Newark, New Jersey, supports a husband and five children on half an acre of land by raising roots and flowers, and has purchased two houses with the surplus profits.

Wyoming produces quantities of precious stones. The topaz, amethyst, agate, opal, jasper, chalcodony, garnet, and several others, abound there, of the very finest quality.

A California professor is writing essays on the fly's nose. A very ticklish place to write essays, we should say, though perhaps he knows it.

Jasper Morgan, of Middletown, Connecticut, never called a doctor until he was in his eighty-eighth year. Then he called one, and is gathered to his fathers.

A rich old citizen of Cologne, who died there during last month, ordered in his will that he should be buried in his fur coat, being probably afraid that he should catch cold in his grave.

Swinburne, the poet, although only twenty-five years old, is said to look over forty. His enemies ascribe his aged appearance to the excessive use of black coffee, brandy, and opium.

The annual rent of the Fifth-Avenue Hotel is two hundred thousand dollars. The lessees get back seventy-five thousand dollars from the rent of stores.

A Philadelphia man bought an elephant at auction, and she tore down five hundred dollars' worth of stable for him the first night.

"The good are taken first" does not apply at photograph-establishments or barber-shops. Each must take his or her turn, good or wicked.

Early in life Peter Cooper broke down in three different kinds of business, and then tried the manufacture of glue. That stuck.

Mr. Cobb has married Miss Webb. He knew that they were to be joined as soon as he spied her.

There are six thousand and ninety manufacturing establishments in Philadelphia according to the late census.

While gold is worth seventeen dollars per ounce, fine blond hair readily commands twenty-five.

The way to treat a man of doubtful credit is to take no note of him.

It is a mistake to suppose the sun is supported in the skies by its beams.

A man who has tried it says that all the short-cuts to wealth are overcrowded.

There are four hundred and thirty-seven lakes in Oakland County, Michigan.

The census of Florida shows an Indian population of two hundred and two.

There are now more than a score of republics in the world.

A Chicago sausage-maker, with unusual candor, advertises his wares as "dog cheap."

Eight of the foreign diplomats at Washington are married to American wives.

Austria, according to late census returns, has a population of 35,943,592 souls.

Among ladies of fashion in New York the mania for skating seems to have died out.

Western adaptation of the words of the poet: "Lonnie the poor Indian."

Mr. Gladstone has reached his sixty-first birthday. Mr. Disraeli is sixty-five.

The Museum.

THE second volume of Mr. Darwin's great work on "The Descent of Man" relates chiefly to the interesting subject of sexual selection. He argues that the sexes have mutually a great influence on the development of each other. The desire of the males to please the females has produced among animals, and especially among birds, the superior beauty of the male; and his superior strength, size, courage, pugnacity, and his natural weapons, such as horns and spurs, are attributed to the same influence. Almost all male birds are extremely pugnacious, using their beaks, wings, and legs for fighting together. We see this every spring with our robins and sparrows. The smallest of all birds—namely, the humming-bird—is one of the most quarrelsome. Mr. Gosse describes a battle in which a pair of humming-birds seized hold of each other's beaks, and whirled round and round till they almost fell to the ground; and M. Montes de Oca, in speaking of another genus, says that two males rarely meet without a fierce aerial encounter. When kept in cages, "their fighting has mostly ended in the splitting of the tongue of one of the two, which then surely dies from being unable to feed." With waders, the males of the common water-hen, "when pairing, fight violently for the females; they stand nearly upright in the water, and strike with their feet." Two were seen to be thus engaged for half an hour, until one got hold of the head of the other, which would have been killed, had not the observer interfered; the female all the time looking on as a quiet spectator. The

males of an allied bird (*Gallinago cristatus*) are one-third larger than the females, and are so pugnacious during the breeding-season that they are kept by the natives of Eastern Bengal for the sake of fighting. Various other birds are kept in India for the same purpose—for instance, the bulbuls, which “fight with great spirit.”

The polygamous ruff, of which we give an illustration, is notorious for his extreme pugnacity; and in the spring the males, which are considerably larger than the females, congregate day after day at a particular spot, where the females propose to lay their eggs. The fowling discover these spots by the turf being

trampled somewhat bare. Here they fight very much like game-cocks, seizing each other with their beaks, and striking with their wings. The great ruff of feathers round the neck is

then erected, and, according to Colonel Montagu, “sweeps the ground as a shield to defend the more tender parts;” and this is the only instance known, in the case of birds, of any structure serving as a shield. The ruff of feathers, however, from its varied and rich colors, probably serves in chief part as an ornament. Like most pugnacious birds, they seem always ready to fight, and, when closely confined, often kill each other; but Montagu observed that their pugnacity becomes greater during the spring, when the long feathers on their necks are fully developed, and at this period the least movement by any one bird provokes a general battle.

The Ruff or Macraea Pugnax (from Brehm's "Thierleben.")

HARVEY FISK.

A. S. HATCH.

OFFICE OF FISK & HATCH, BANKERS,
No. 5 NASSAU STREET, NEW YORK, March 21, 1871.

THE FIRST MORTGAGE SIX PER CENT. GOLD BONDS OF THE CHESAPEAKE AND OHIO RAILROAD COMPANY—of which about \$6,000,000 have already been marketed—are secured upon an East and West Trunk Line of Road, 427 miles in length, the greater part of which (227 miles) is in earning operation, and the remainder rapidly building. When completed, it will establish a short, economical, and favorite route between tide-water navigation and the chief railroad and river cities of the West.

Besides the immense volume of through traffic between the East and West, which this Road can command by its unapproachable advantages in distance, grades, fuel, and unfailing navigable connections, this Road must convey enormous quantities of the superior smelting, cannel, and bituminous coals of the Kanawha Valley, and the iron ores of Virginia and West Virginia, which are in demand at both ends of the line.

The value of the property, the certainty of a large and profitable business, the established reputation and credit of the Company, and its able and honorable management, give to these securities an assurance of superior value and safety.

They may be had in *Coupon* or *Registered* form, and in denominations of
\$1,000, \$500, and \$100.

We have prepared pamphlets, showing the agricultural, mineral, and manufacturing advantages of the adjacent territory, and the traffic facilities and financial prospects of the Road, which will be furnished on application.

RALPH THE HEIR.

By ANTHONY TROLLOPE.

["RALPH THE HEIR." SUPPLEMENT NO. XX.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF APRIL 1.]

CHAPTER XLIX.—Continued.

He was delighted to welcome Ralph from Norfolk to all the pleasures of the metropolis. Should he put down Ralph's name at the famous Carlton, of which he had lately become a member? Ralph already belonged to an old-fashioned club, of which his father had been long a member, and declined the new honor. As for balls, evening crushes, and large dinner-parties, our Norfolk Ralph thought himself to be unsuited for them just at present, because of his father's death. It was not for the nephew of the dead man to tell the son that eight months of mourning for a father was more than the world now required. He could only take the excuse, and suggest the play, and a little dinner at Richmond, and a small party at Maidenhead as compromises. "I don't know that there is any good in a fellow being so heavy in hand because his father is dead," the squire said to his brother.

"They were so much to each other," pleaded Gregory in return. The squire accepted the excuse, and offered his namesake a horse for the park. Would he make one of the party for the moors in August? The squire asserted that he had room for another gun, without entailing any additional expense upon himself. This, indeed, was not strictly true, as it had been arranged that the cost should be paid per gun; but there was a vacancy still, and Ralph the heir, being quite willing to pay for his cousin, thought no harm to cover his generosity under a venial falsehood. The disinherited one, however, declined the offer, with many thanks. "There is nothing, old fellow, I wouldn't do for you, if I knew how," said the happy heir. Whereupon the Norfolk Ralph unconsciously resolved that he would accept nothing—or as little as possible—at the hands of the squire.

All this happened during the three or four first days of his sojourn in London, in which, he hardly knew why, he had gone neither to the villa nor to Sir Thomas in Southampton Buildings. He meant to do so, but from day to day he put it off. As regarded the ladies at the villa, the three young men now never spoke to each other respecting them. Gregory believed that his brother had failed, and, so believing, did not recur to the subject. Gregory himself had already been at Fulham once or twice since his arrival in town; but had nothing to say—or, at least, did say nothing—of what happened there. He intended to remain away from his parish for no more than

the parson's normal thirteen days, and was by no means sure that he would make any further formal offer. When at the villa, he found that Clarissa was sad and sober, and almost silent; and he knew that something was wrong. It hardly occurred to him to believe that after all he might perhaps cure the evil.

One morning, early, Gregory and Ralph from Norfolk were together at the Royal Academy. Although it was not yet ten when they entered the gallery, the rooms were already so crowded that it was difficult to get near the line, and almost impossible either to get into or to get out of a corner. Gregory had been there before, and knew the pictures. He also was supposed by his friends to understand something of the subject; whereas Ralph did not know a Cooke from a Hook, and possessed no more than a dim idea that Landseer painted all the wild beasts, and Milais all the little children. "That's a fine picture," he said, pointing up to an enormous portrait of the Master of the B. B., in a red coat, seated square on a seventeen-hand high horse, with his hat off, and the favorite hounds of his pack around him.

"That's by Grant," said Gregory. "I don't know that I care for that kind of thing."

"It's as like as it can stare," said Ralph, who appreciated the red coat, and the well-groomed horse, and the finely-shaped hounds. He backed a few steps to see the picture better, and found himself encroaching upon a lady's dress. He turned round and found that the lady was Mary Bonner. Together with her were both Clarissa and Patience Underwood.

The greetings between them all were pleasant, and the girls were unaffectedly pleased to find friends whom they knew well enough to accept as guides and monitors in the room. "Now we shall be told all about every thing," said Clarissa, as the young parson shook hands first with her sister and then with her. "Do take us round to the best dozen, Mr. Newton. That's the way I like to begin." Her tone was completely different from what it had been down at the villa.

"That gentleman in the red coat is my cousin's favorite," said Gregory.

"I don't care a bit about that," said Clarissa.

"That's because you don't hunt," said Ralph.

"I wish I hunted," said Mary Bonner.

Mary, when she first saw the man, of whom

she had once been told that he was to be her lover, and, when so told, had at least been proud that she was so chosen—felt that she was blushing slightly; but she recovered herself instantly, and greeted him as though there had been no cause whatever for disturbance. He was struck almost dumb at seeing her, and it was her tranquillity which restored him to composure. After the first greetings were over he found himself walking by her side without any effort on her part to avoid him, while Gregory and the two sisters went on in advance. Poor Ralph had not a word to say about the pictures. "Have you been long in London?" she asked.

"Just four days."

"We heard that you were coming, and did think that perhaps you and your cousin might find a morning to come down and see us—your Cousin Gregory, I mean."

"Of course, I shall come."

"My uncle will be so glad to see you—only, you know, you can't always find him at home. And so will Patience. You are a great favorite with Patience. You have gone down to live in Norfolk—haven't you?"

"Yes—in Norfolk."

"You have bought an estate there?"

"Just one farm that I look after myself. It's no estate, Miss Bonner—just a farm-house, with barns and stables, and a horse-pond, and the rest of it." This was by no means a fair account of the place, but it suited him so to speak of it. "My days for having an estate were quickly brought to a close—were they not?" This he said with a little laugh, and then hated himself for having spoken so foolishly.

"Does that make you unhappy, Mr. Newton?" she asked. He did not answer her at once, and she continued, "I should have thought that you were above being made unhappy by that."

"Such disappointments carry many things with them of which people outside see nothing."

"That is true, no doubt."

"A man may be separated from every friend he has in the world by such a change of circumstances."

"I had not thought of that. I beg your pardon," said she, looking into his face almost imploringly.

"And there may be worse than that," he said. Of course she knew what he meant, but he did not know how much she knew. "It is easy to say that a man should stand

up against reverses—but there are some reverses a man cannot bear without suffering." She had quite made up her mind that the one reverse of which she was thinking should be cured; but she could take no prominent step toward curing it yet. But that some step should be taken sooner or later she was resolved. It might be taken now, indeed, if he would only speak out. But she quite understood that he would not speak out now because that house down in Norfolk was no more than a farm. "But I didn't mean to trouble you with all that nonsense," he said.

"It doesn't trouble me at all. Of course you will tell us every thing when you come to see us."

"There is very little to tell—unless you care for cows and pigs, and sheep and horses."

"I do care for cows and pigs, and sheep and horses," she said.

"All the same, they are not pleasant subjects of conversation. A man may do as much good with a single farm as he can with a large estate; but he can't make his affairs as interesting to other people." There was present to his own mind the knowledge that he and his rich namesake were rivals in regard to the affections of this beautiful girl, and he could not avoid allusions to his own inferiority. And yet his own words, as soon as they were spoken and had sounded in his ear, were recognized by himself as being mean and pitiful—as whining words, and sorry complaints against the trick which Fortune had played him. He did not know how to tell her boldly that he lamented this change from the estate to the farm, because he had hoped that she would share the one with him, and did not dare even to ask her to share the other. She understood it all, down to the look of displeasure which crossed his face as he felt the possible effect of his own speech. She understood it all, but she could not give him much help—as yet. There might, perhaps, come a moment in which she could explain to him her own ideas about farms and estates, and the reasons in accordance with which these might be selected and those rejected. "Have you seen much of Ralph Newton lately?" asked the other Ralph.

"Of your cousin?"

"Yes—only I do not call him so. I have no right to call him my cousin."

"No; we do not see much of him." This was said in a tone of voice which ought to have sufficed for curing any anxiety in Ralph's bosom respecting his rival. Had he not been sore and nervous, and, as it must be admitted, almost stupid in the matter, he could not but have gathered from that tone that his namesake was at least no favorite with Miss Bonner.

"He used to be a great deal at Popham Villa," said Ralph.

"We do not see him often now. I fancy there has been some cause of displeasure between him and my uncle. His brother has been with us once or twice. I do like Mr. Gregory Newton."

"He is the best fellow that ever lived," exclaimed Ralph, with energy.

"So much nicer than his brother," said Mary—"though perhaps I ought not to say so to you."

This at any rate could not but be satisfactory to him. "I like them both," he said; "but I love Greg dearly. He and I have lived together like brothers for years, whereas it is only quite lately that I have known the other."

"It is only lately that I have known either—but they seem to me to be so different. Is not that a wonderfully beautiful picture, Mr. Newton? Can't you almost fancy yourself sitting down and throwing stones into the river, or dabbling your feet in it?"

"It is very pretty," said he, not caring a penny for the picture.

"Have you any river at Beamingham?"

"There's a muddy little brook that you could almost jump over. You wouldn't want to dabble in that."

"Has it got a name?"

"I think they call it the Wissey. It's not at all a river to be proud of—except in the way of eels and water-rats."

"Is there nothing to be proud of at Beamingham?"

"There's the church-tower—that's all."

"A church-tower is something—but I meant as to Beamingham Hall."

"That word Hall misleads people," said Ralph. "It's a kind of upper-class farmhouse with a lot of low rooms, and intricate passages, and chambers here and there, smelling of apples, and a huge kitchen, and an oven big enough for a small dinner-party."

"I should like the oven."

"And a laundry, and a dairy, and a cheese-house—only we never make any cheese; and a horse-pond, and a dunghill, and a cabbage-garden."

"Is that all you can say for your new purchase, Mr. Newton?"

"The house itself isn't ugly."

"Come—that's better."

"And it might be made fairly comfortable, if there were any use in doing it."

"Of course there will be use."

"I don't know that there will," said Ralph. "Sometimes I think one thing, and sometimes another. One week I'm full of a scheme about a new garden and a conservatory, and a bow-window to the drawing-room; and then, the next week, I think that the two rooms I live in at present will be enough for me."

"Stick to the conservatory, Mr. Newton. But here are the girls, and I suppose it is about time for us to go."

"Mary, where have you been?" said Clarissa.

"Looking at landscapes," said Mary.

"Mr. Newton has shown us every picture worth seeing, and described every thing, and we haven't had to look at the catalogue once. That's just what I like at the Academy. I don't know whether you've been as lucky."

"I've had a great deal described to me

too," said Mary; "but I'm afraid we've forgotten the particular duty that brought us here."

Then they parted, the two men promising that they would be at the villa before long, and the girls preparing themselves for their return home.

"That cousin of theirs is certainly very beautiful," said Gregory, after some short tribute to the merits of the two sisters.

"I think she is," said Ralph.

"I do not wonder that my brother has been struck with her."

"Nor do I." Then after a pause he continued: "She said something which made me think that she and your brother haven't quite hit it off together."

"I don't know that they have," said Gregory. "Ralph does change his mind sometimes. He hasn't said a word about her to me lately."

CHAPTER L.

ANOTHER FAILURE.

THE day after the meeting at the Academy, as Ralph, the young squire, was sitting alone in his room over a late breakfast, a maid-servant belonging to the house opened the door and introduced Mr. Neeft. It was now the middle of May, and Ralph had seen nothing of the breeches-maker since the morning on which he had made his appearance in the yard of the Moonbeam. There had been messages, and Mr. Carey had been very busy endeavoring to persuade the father that he could benefit neither himself nor his daughter by persistence in so extravagant a scheme. Money had been offered to Mr. Neeft—most unfortunately, and this offer had added to his wrongs. And he had been told by his wife that Polly had at last decided in regard to her own affections, and had accepted her old lover, Mr. Moggs. He had raved at Polly to her face. He had sworn at Moggs behind his back. He had called Mr. Carey very hard names—and now he forced himself once more upon the presence of the young squire.

"Captain," he said, as soon as he had carefully closed the door behind him, "are you going to be upon the square?"

Newton had given special orders that Neeft should not be admitted to his presence; but here he was, having made his way into the chamber in the temporary absence of the squire's own servant.

"Mr. Neeft," said Newton, "I cannot allow this."

"Not allow it, captain?"

"No—I cannot. I will not be persecuted. I have received favors from you—"

"Yes, you have, captain."

"And I will do any thing in reason to repay them."

"Will you come out and see our Polly?"

"No, I won't."

"You won't?"

"Certainly not. I don't believe your

daughter wants to see me. She is engaged to another man." So much Mr. Carey had learned from Mrs. Neeft. "I have a great regard for your daughter, but I will not go to see her."

"Engaged to another man—is she?"

"I am told so."

"Oh—that's your little game, is it? And you won't see me when I call—won't you? I won't stir out of this room unless you sends for the police, and so we'll get it all into one of the courts of law. I shall just like to see how you'll look when you're being cross-backed by one of them learned gents. There'll be a question or two about the old breeches-maker as the Squire of Newton mayn't like to see in the papers the next morning. I shall take the liberty of ringing the bell and ordering a bit of dinner here, if you don't mind. I sha'n't go when the police comes without a deal of a row, and then we shall have it all out in the courts."

This was monstrously absurd, but, at the same time, very annoying. Even though he should disregard that threat of being "cross-backed by a learned gent," and of being afterward made notorious in the newspapers—which, it must be confessed, he did not find himself able to disregard—still, independently of that feeling, he was very unwilling to call for brute force to remove Mr. Neeft from the arm-chair in which that worthy tradesman had seated himself. He had treated the man otherwise than as a tradesman. He had borrowed the man's money, and eaten the man's dinners; visited the man at Ramsgate, and twice offered his hand to the man's daughter. "You are very welcome to dine here," he said, "only I am sorry that I cannot dine here with you."

"I won't stir from the place for a week."

"That will be inconvenient," said Ralph.

"Uncommon inconvenient, I should say, to a gent like you—especially as I shall tell everybody that I'm on a visit to my son-in-law."

"I meant to yourself—and to the business."

"Never you mind the business, captain. There'll be enough left to give my girl all the money I promised her, and I don't think I shall have to ask you to keep your father-in-law neither. Sending an attorney to offer me a thousand pounds! It's my belief I could buy you out yet, captain, in regard to ready money."

"I dare say you could, Mr. Neeft."

"And I won't stir from here till you name a day to come and see me and my missus and Polly."

"This is sheer madness, Mr. Neeft."

"You think so—do you, captain? You'll find me madder nor you think for yet. I'm not a-going to be put down upon by you, and nothing come of it. I'll have it out of you in money or marbles, as the saying is. Just order me a glass of sherry-wine, will you? I'm a thirsty talking. When you came a visiting me, I always give you lashings of drink." This was so true that Ralph felt himself compelled to ring the bell, and order

up some wine. "Soda-and-brandy let it be, Jack," said Mr. Neeft, to Mr. Newton's own man. "It'll be more comfortable-like between near relations."

"Soda-water-and-brandy for Mr. Neeft," said the young squire, turning angrily to the man. "Mr. Neeft, you are perfectly welcome to as much brandy as you can drink, and my man will wait upon you while I'm away. Good-morning." Whereupon Newton took up his hat and left the room. He had not passed into the little back room in which he knew that the servant would be looking for soda-water, before he heard a sound as of smashed crockery, and he was convinced that Mr. Neeft was preparing himself for forcible eviction by breaking his ornaments. Let the ornaments go, and the mirror, and the clock on the chimney-piece, and the windows! It was a frightful nuisance, but any thing would be better than sending for the police to take away Mr. Neeft. "Keep your eye on that man in the front room," said he, to his Swiss valet.

"On Mr. Neeft, saar?"

"Yes; on Mr. Neeft. He wants me to marry his daughter, and I can't oblige him. Let him have what he wants to eat and drink. Get rid of him if you can, but don't send for the police. He's smashing all the things, and you must save as many as you can." So saying, he hurried down the stairs and out of the house. But what was he to do next? If Mr. Neeft chose to carry out his threat by staying in the rooms, Mr. Neeft must be allowed to have his own way. If he chose to amuse himself by breaking the things, the things must be broken. If he got very drunk, he might probably be taken home in a cab, and deposited at the cottage at Hendon. But what should Ralph do at this moment? He sauntered sadly down St. James's Street with his hands in his trousers-pockets, and, finding a crawling hansom at the palace-gate, he got into it and ordered the man to drive him down to Fulham. He had already made up his mind about "dear little Clary," and the thing might as well be done at once. None of the girls were at home. Miss Underwood and Miss Bonner had gone up to London to see Sir Thomas. Miss Clarissa was spending the day with Mrs. Brownlow. "That will just be right," said Ralph, to himself, as he ordered the cabman to drive him to the old lady's house on the Brompton Road.

Mrs. Brownlow had ever been a great admirer of the young squire, and did not admire him less now that he had come to his squireship. She had always hoped that Clary would marry the real heir, and was sounding his praises while Ralph was knocking at her door.

"He is not half so fine a fellow as his brother," said Clarissa.

"You did not use to think so," said Mrs. Brownlow. Then the door was opened and Ralph was announced.

With his usual easy manner—with that unabashed grace which Clarissa used to think so charming—he soon explained that he had been to Fulham, and had had himself driven back to Bolsover House because Clarissa was

there. Clarissa, as she heard this, felt the blood tingle in her cheeks. His manner now did not seem to her to be so full of grace. Was it not all selfishness? Mrs. Brownlow purred out her applause. It was not to be supposed that he came to see an old woman—but his coming to see a young woman, with adequate intentions, was quite the proper thing for such a young man to do! They were just going to take lunch. Of course, he would stop and lunch with them. He declared that he would like nothing better. Mrs. Brownlow rang the bell, and gave her little orders. Clarissa's thoughts referred quickly to various matters—to the scene on the lawn, to a certain evening on which she had walked home with him from this very house, to the confessions which she had made to her sister, to her confidence with her cousin—and then to the offer that had been made to Mary, now only a few weeks since. She looked at him, though she did not seem to be looking at him, and told herself that the man was nothing to her. He had caused her unutterable sorrow, with which her heart was still sore—but he was nothing to her. She would eat her lunch with him, and endeavor to talk to him; but the less she might see of him henceforth the better. He was selfish, heartless, weak, and unworthy.

The lunch was eaten, and, within three minutes afterward, Mrs. Brownlow was away. As they were returning to the little parlor in which they had been sitting during the morning, she contrived to escape, and Ralph found himself alone with his "dear, darling little Clary." In spite of his graceful ease, the task before him was not without difficulty. Clarissa, of course, knew that he had proposed to Mary, and probably knew that he had proposed to Polly. But Mary had told him that Clarissa was devoted to him—had told him at least that which amounted to almost as much. And then it was incumbent on him to do something that might put an end to the Neeft abomination. Clarissa would be contented to look back upon that episode with Mary Bonner, as a dream that meant nothing—just as he himself was already learning to look at it.

"Clary," he said, "I have hardly seen you to speak to you since the night we walked home together from this house."

"No, indeed, Mr. Newton," she said. Hitherto she had always called him Ralph. He did not observe the change, having too many things of his own to think of at the moment.

"How much has happened since that evening!"

"Very much, indeed, Mr. Newton."

"And yet it seems to be such a short time ago—almost yesterday. My poor uncle was alive then."

"Yes, he was."

He did not seem to be getting any nearer to his object by these references to past events.

"Clary," he said, "there are many things which I wish to have forgotten, and some perhaps which I would have forgiven."

"I suppose that is so with all of us," said Clarissa.

"Just so, though I don't know that any of us have ever been so absurdly foolish as I have—throwing away what was of the greatest value in the world for the sake of something that seemed to be precious, just for a moment."

It was very difficult, and he already began to feel that the nature of the girl was altered toward him. She had suddenly become hard, undemonstrative, and almost unkind. Hitherto he had always regarded her, without much conscious thought about it, as a soft, sweet, pleasant thing, that might at any moment be his for the asking. And Mary Bonner had told him that he ought to ask. Now he was willing to beseech her pardon, to be in very truth her lover, and to share with her all his prosperity. But she would give him no assistance in his difficulty. He was determined that she should speak, and, trusting to Mrs. Brownlow's absence, he sat still, waiting for her.

"I hope you have thrown away nothing that you ought to keep," she said at last. "It seems to me that you have got every thing."

"No—not as yet every thing. I do not know whether I shall ever get that which I desire the most."

Of course she understood him now; but she sat hard, and fixed, and stern—so absolutely unlike the Clarissa whom he had known since they were hardly more than children together!

"You know what I mean, Clarissa."

"No—I do not," she said.

"I fear you mean that you cannot forgive me."

"I have nothing to forgive."

"Oh, yes, you have; whether you will ever forgive me I cannot say. But there is much to forgive—very much. Your cousin Mary for a short moment ran away with us all."

"She is welcome—for me."

"What do you mean, Clarissa?"

"Just what I say. She is welcome for me. She has taken nothing that I prize. Indeed, I do not think she has condescended to take any thing—any thing of the sort you mean. Mary and I love each other dearly. There is no danger of our quarrelling."

"Come, Clary," he got up as he spoke, and stood over her, close to her shoulder, "you understand well enough what I mean. We have known each other so long, and I think we have loved each other so well, that you ought to say that you will forgive me. I have been foolish. I have been wrong. I have been false, if you will. Cannot you forgive me?"

Not for a moment was there a look of

forgiveness in her eye, or a sign of pardon in the lines of her face. But in her heart there was a contest. Something of the old passion remained there, though it was no more than the soreness it had caused. For half a moment she thought whether it might not be as he would have it. But if so, how could she again look any of her friends in the face and admit that she had surrendered herself to so much unworthiness? How could she tell Patience, who was beginning to be full of renewed hope for Gregory? How could she confess such a weakness to her father? How could she stand up before Mary Bonner? And was it possible that she should really give herself, her whole life, and all her future hopes, to one so weak and worthless as this man?

"There is nothing to forgive," she said, "but I certainly cannot forget."

"You know that I love you," he protested.

"Love me—yes, with what sort of love? But it does not matter. There need be no further talk about it. Your love to me can be nothing."

"Clarissa!"

"And to you it will be quite as little. Your heart will never suffer much, Ralph. How long is it since you offered your hand to my cousin? Only that you are just a boy playing at love, this would be an insult." Then she saw her old friend through the window.—"Mrs. Brownlow," she said, "Mr. Newton is going, and I am ready for our walk whenever you please."

"Think of it twice, Clarissa—must this be the end of it?" pleaded Ralph.

"As far as I am concerned it must be the end of it. When I get home I shall probably find that you have already made an offer to Patience."

Then he got up, took his hat, and having shaken hands cordially with Mrs. Brownlow through the window, went out to his hansom cab, which was earning sixpence a quarter of an hour out on the road, while he had been so absolutely wasting his quarter of an hour within the house.

"Has he said any thing, my dear?" asked Mrs. Brownlow.

"He has said a great deal."

"Well, my dear?"

"He is an empty, vain, inconstant man."

"Is he, Clarissa?"

"And yet he is so good-humored, and so gay, and so pleasant, that I do not see why he should not make a very good husband to some girl."

"What do you mean, Clarissa? You have not refused him?"

"I did not say he had offered—did I?"

"But he has?"

"If he did—then I refused him. He is

good-natured; but he has no more heart than a log of wood. Don't talk about it any more, dear Mrs. Brownlow. I dare say we shall all be friends again before long, and he'll almost forget every thing that he said this morning."

Throughout the afternoon she was gay and almost happy, and before she went home she had made up her mind that she would tell Patience, and then get rid of it from her thoughts forever. Not to tell Patience would be a breach of faith between them, and would, moreover, render future sisterly intercourse between them very difficult. But had it been possible she would have avoided the expression of triumph without which it would be almost impossible for her to tell the story. Within her own bosom certainly there was some triumph. The man for whose love she had sighed and been sick had surrendered to her at last. The prize had been at her feet, but she had not chosen to lift it. "Poor Ralph," she said to herself; "he means to do as well as he can, but he is so feeble." She certainly would not tell Mary Bonner, nor would she say a word to her father. And when she should meet Ralph again—as she did not doubt but that she would meet him shortly, she would be very careful to give no sign that she was thinking of his disgrace. He should still be called Ralph—till he was a married man; and when it should come to pass that he was about to marry she would congratulate him with all the warmth of old friendship.

That night she did tell it all to Patience. "You don't mean," she said, "that I have not done right?"

"I am sure you have done quite right."

"Then why are you so sober about it, Patty?"

"Only if you do love him—I would give my right hand, Clary, that you might have that which shall make you happy in life."

"If you were to give your right and left hand too, a marriage with Ralph Newton would not make me happy. Think of it, Patty—to both of us within two months! He is just like a child. How could I ever have respected him, or believed in him? I could never have respected myself again. No, Patty, I did love him dearly. I fancied that life without him must all be a dreary blank. I made him into a god—but his feet are of the poorest clay! Kiss me, dear, and congratulate me—because I have escaped."

Her sister did kiss her and did congratulate her—but still there was a something of regret in the sister's heart. Clarissa was, to her thinking, so fit to be the mistress of Newton Priory.

APPLETONS' JOURNAL

OF LITERATURE · SCIENCE · AND ART

ESTABLISHED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 108.—VOL. V.]

SATURDAY, APRIL 22, 1871.

[PRICE TEN CENTS.]

THE MAID OF KIRCONNEL.

[While pursuing a doe, along the banks of the Kirtle, Adam Fleming first saw, in her wild-wood bower, "fair Helen of Kirconnel." Their trysting-place was the grave of "Mary of the le;" and here Helen met her death by receiving in her own bosom the fatal arrow which his jealous rival intended for her lover.]

O KIRTLE, hastening to the sea,
Through banks of sunniest green,
But for thy tender witchery
"Fair Helen, of Kirconnel lea,"
A happier fate had seen.

A wood-bower sweet, whose vines displayed
A royal wealth of flowers;
Why did you lure the dreaming maid,
So oft beneath your haunted shade,
To pass the charmed hours?

For hidden, like the feathery choir,
There from the noontide's glance,
She lit the heart's first vestal fire,
And fed its flame of soft desire,
With dreams of old romance.

Poor, frightened doe, that sought the shade
Of that sequestered place;
And led the tender, timid maid,
Blushing, surprised, and half-afraid,
To meet the hunter's face.

Not thine the fault, but thine the deed,
Blind, harmless innocent;
When to that bosom, doomed to bleed,
With cruel, swift, unerring speed,
The fatal arrow went.

Why came no warning voice to save,
No cry upon the blast,
When Helen fair, and Fleming brave,
Sat on the dead Kirconnell's grave,
And spake, and kissed their last?

O Mary, gone in life's young bloom,
O "Mary of the le,"
Couldst thou not leave one hour the tomb,
To save her from that hapless doom,
So soon to sleep by thee?

Vain, vain, to say what might have been,
Or strive with cruel Fate;
Evil the world hath entered in,
And sin is death, and death is sin,
And love must trust and wait.

For here the crown of lovers true
Still hides its flowers beneath—
The sharpest thorns that ever grew,
The thorns that pierce us through and through,
And make us bleed to death!

PHOEBE CARY.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE ATLMER."

CHAPTER XI.—AT MORTON HOUSE.

THE whole of that afternoon, which looked so bright to the gay loiterers beside the pond, Mrs. Gordon had spent in the silence and shadow of the Morton-House library, deep in dusty and tedious accounts which had been submitted to her inspection by Mr. Shields, the agent of the Morton estate. It was not a pleasant occupation, but it was one to which she had courageously set herself immediately on her arrival, and in which she had not flagged even when the terribly-involved condition of affairs had been brought plainly to her perception. Debt, difficulty, mortgage, ruinous sacrifice! That was the sum-total of the heritage to which she had returned; and, what the old agent unhesitatingly called "the most tangled business in the country," was what she took in her woman's hands to attempt to make straight again. She succeeded better than might have been expected—succeeded sufficiently to rouse Mr. Shields's honest admiration, and make him tell Lawyer Worruck that he had never seen such business capacity in any woman before. But it was weary work at all times, and never more weary than on this afternoon. So weary that, when she came to the end of a long column of figures, she dropped her pen with a tired sigh, and, leaning her head against the back of her chair, sat motionless for some time.

On this repose, however, Babette broke in suddenly and uncere- moniously, just as the last rays of the setting sun flashed a gleam of vivid light across the pale, tired face.

"Madame, pardonnez-moi," she began, hurriedly, as her mistress's eyes opened wide in somewhat haughty astonishment. "But madame always said that if any thing happened to M'sieur Felix, she must be disturbed, and I dared not—"

"Felix!" cried the mother, with a sudden start of alarm. "Felix! Is any thing the matter with him?"

"Indeed, madame, it was not my fault; but that stupid—"

"Babette! Is any thing the matter?"

"Non, madame, non," cried the maid, startled by the tone of her mistress's voice. "M'sieur Felix is all safe—but that stupid Harrison has let in a lady."

Mrs. Gordon gave a deep sigh of relief.

"You frightened me very much," she said, rebukingly. "You should not talk so much at random. What has Felix to do with a lady? He is at the pond with Mr. Annesley."

"But, madame, the lady has brought him home."

"The lady! You must be mistaken."

"Indeed, no, madame. I saw them; and that stupid—"

"Then it is Mrs. Annesley?"

Babette shook her head. "*C'est une demoiselle*," she said decidedly. "I saw her myself, madame; and M'sieur Felix—"

"Hold your tongue!" cried a shrill indignant voice at the door. And the next moment, "M'sieur Felix" himself had rushed into the room, and thrown his arms round his mother.

"Mamma, don't listen to her! I'll tell you all about it—but promise first you won't be angry."

"That depends on whether there is good cause for being angry," said his mother, pushing back the bright curls from the glowing face, and looking anxiously into it. "But I can promise not to be very much displeased if you will tell me the exact truth."

"That's what I mean to do, mamma. But kiss me first, and—go away!" he added, with a sudden stamp at Babette.

The Frenchwoman looked unutterable things at him, tossed her head, and held her ground firmly, until Mrs. Gordon herself bade her go.

"But the lady, madame?"

"I will see her in a minute—you need not wait."

Babette gave another glance at Felix, and then retired, with offended dignity rustling in every garment. Her only solace was to go and rate Harrison, and this she immediately proceeded to do.

Katharine, meanwhile, left alone in the large empty drawing-room, began to revolve the awkwardness of her position. She was sorry now that she had acceded to Mr. Warwick's request. It seemed so much like forcing an entrance into Morton House. As for mediation or explanation—Felix's impetuosity had spared her all question of that. Was nobody ever coming? Would it be very wrong to go away without having seen the lady of the house? Perhaps, after all, that might be best. She would wait ten minutes longer, and, if by that time Mrs. Gordon had not made her appearance, why—she would go. She had hardly arrived at this determination, when the door opened, and a pale, stately woman stood on the threshold.

Katharine rose, but before she could utter one of the words of apology trembling on her tongue, Mrs. Gordon crossed the floor, and extended her hand with a warm and cordial gesture.

"Miss Tresham, I owe you many thanks. It was kind of you to take charge of my wilful boy. Pray forgive me that I have kept you waiting; but he has been giving me an account of his adventure."

This, or something like it, was what she said; but no words can embody the gracious and exquisite charm of manner which at once set Katharine at ease—at once made her feel that, instead of being an intruder, she was a welcome guest. A few words told why the duty had devolved upon herself—a few more gave the leading facts of the matter; after which, she rose to take her departure. But this Mrs. Gordon would not permit.

"You are cold, and you must be tired," she said. "It is a point of honor with Morton House that no guest has ever left its door in either of those conditions. This room is my aversion, it is so cheerless. Let me take you to my sitting-room."

"You are very kind," said Katharine, overcome with wonder; "but the carriage is waiting for me, and—"

"If you will allow me, I will have it dismissed, and take the responsibility of sending you home."

"I am afraid Mrs. Marks will be uneasy."

"I am sure she will be able to spare you," said the lady, with a

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

light smile. "Come, Miss Tresham, I am not accustomed to pressing hospitality; but in this instance I really cannot consent to let you go. Shall I put my request on another ground? Shall I tell you that I am lonely this evening, and that a strange face is a great relief to me? I have not felt this desire for companionship before in many a long day. Will you have the heart to disappoint it now?"

"No," said Katharine, with her frank, bright smile. "If my society can gratify your desire, I shall be very glad to stay. But—"

"But I regard the matter as settled," said Mrs. Gordon. Then, after ringing the bell, and sending an order of dismissal to the waiting carriage, she led the way across a large, cold hall, into one of the most thoroughly-charming rooms, Katharine thought, she had ever seen.

A first glance only gave the impression of rich color and luxurious comfort. It was some time before the eye recognized the different elements that went to make up such an attractive whole—the heavy curtains, the velvet carpet, the deep, inviting chairs and couches, the many appointments where taste of the most rare and judicious kind had presided. When Katharine entered, it was empty, but a faint fragrance of flowers came over her as the door opened, and a soft moonlight seemed to fill the room—the glow of two large lamps being toned by tinted shades. Dusk had fallen by this time; and the lamp-light and ruddy firelight made a pleasant contrast to the cold, frosty night gathering outside the open hall-door, and melting into indistinctness the outlines of the rolling hills.

"Oh, what a beautiful room!" cried Katharine, so involuntarily that Mrs. Gordon smiled.

"I am glad you like it," she said. "It is the only room I have refurnished; but I cannot endure the stiff old-fashioned furniture which reigns paramount in the rest of the house. Excepting my cousin, Mr. Annesley, you are the only person who has been admitted here."

"It is beautiful!" Katharine repeated, as she sat down by the glowing fire, sunning herself like a tropical flower in its heat. "I have never seen any thing more luxurious—and I love luxury."

Mrs. Gordon smiled again, perhaps at this candid confession, perhaps at the undisguised enjoyment which prompted it. Then she drew forward a large chair, and seating herself leaned back in its soft depths. The firelight played quivering over her face, and Katharine had time to mark every furrow which marred its beauty before Mrs. Gordon spoke again. At last she turned to look at the young girl, and said, rather abruptly:

"Miss Tresham, my desire to keep you was not entirely without reason. I have heard Morton Annesley speak of you very often, and I was sure of one thing—either that I must like you, or that he exaggerated as even a lover has no right to exaggerate."

Katharine started. This was plain speaking, indeed. She started, and, if she also blushed, it might have been surprise as much as any thing else that caused the emotion.

"Excuse me," said Mrs. Gordon, who noticed both the start and the blush. "Perhaps I have not paid sufficient regard to the proprieties of expression; but when one grows a little old, they seem so useless. Why should we hesitate to call a thing by its right name?"

"Why, indeed," answered Katharine, quickly, "if it be a right name?"

"We won't argue that point," said Mrs. Gordon, with a slight laugh. "I don't think a lover's tale is worth telling, excepting by himself. And here comes tea."

The door opened as she spoke, and Harrison brought in a tray. No other servant appeared; but in a few minutes—without even so much noise as the rattling of a plate—a small round table stood between the two ladies, bearing a glittering equipage.

"Are you still English enough to prefer tea, Miss Tresham, or will you let Harrison give you a cup of coffee?" asked Mrs. Gordon, as she poured out a cup of the first, which was strong enough and black enough to have satisfied even De Quincey. "For my part, I always take this. Will you join me?"

"Not since you have given me my choice," said Katharine, with a smile. "I have never yet learned to endure tea—though I have tried heroically, in compliment to other people's taste."

"Not people here, surely?"

"Oh, no. Everybody here drinks coffee. I meant the people in England."

"And yet you are an Englishwoman?"

"No; I am a West-Indian—and very proud of it. I love my dear island, with its brilliant skies and tropical palms, as much as I hate the mists and fogs of England."

"You have been in England, then?"

Katharine shrugged her shoulders ruefully.

"To my cost, yes."

"In what part? I ask because I am very familiar with it, and perhaps you saw the country to disadvantage."

"I was in the north, near the Scottish border. I saw the Scottish shore from my window every time the fog lifted, and did not enjoy it nearly as much as I should have done if I could have stopped shivering even for one day."

"But was there no summer while you were there?"

"There was a time they called summer—a time when the trees had leaves, and the sun shone with tolerable brightness. But our winter-days in Porto Rico are much more balmy."

"Porto Rico! But I thought—that is—"

"You thought I was a British West-Indian. Well, so I am. I was born in Jamaica; but I scarcely remember it at all. When I was very young, my aunt moved to Porto Rico, and took me with her. We lived there entirely, and I never was in England until I went to an old friend of hers, who obtained a situation as governess at Donthorne Place for me. It was a very—"

She stopped—uncontrollable surprise forcing her to do so. Mrs. Gordon had suddenly turned so pale that even the dim light failed to conceal it, and her hand shook until she was obliged to put down untasted a cup of tea which she had been in the act of raising to her lips. There was a moment's silence; then she looked up, white as a sheet, but forcing herself into a sort of rigid calm.

"Pardon me, Miss Tresham; and pray don't look so much alarmed. It is only an old pain that came back to me just then. My nerves are shattered, and I show it—that is all.—Harrison, you will find my case on the side-table there. Give me two spoonfuls of the bottle on the right as you open it."

Harrison obeyed. Mrs. Gordon drank eagerly the dark liquid which he brought her in a slender wineglass; and a faint, subtle odor rushed over Katharine, which told her at once what the draught had been. After that she needed one explanation the less for the lines on her hostess's face.

It was the latter who, after a short silence, spoke first—quietly, but with a certain suppressed anxiety which Katharine's ear was quick to detect.

"You surprised me very much by the mention of Donthorne Place, Miss Tresham. I was once in the neighborhood, and I remember it quite well. How long were you there?"

"A year," answered Katharine, concisely, having her own reasons for reticence on the subject; "a year—one of the most disagreeable of my life, and one that I would not live over again to win a crown. I cannot bear to talk of it, and, of course, it does not interest you."

"On the contrary, if you will pardon me, it interests me very much. Do you"—she leaned forward with an eagerness which startled Katharine—"do you ever hear from them—the Donthornes?"

"Never. To judge by their unconsciousness of my existence when I lived in their house, I should say that they would not even remember my name now."

"From no friends—no one that you left in the neighborhood?"

Katharine drew back. She was not only surprised; but she looked—even her preoccupied questioner noticed that—as if awakened to some sudden fear.

"No," she said, slowly; "I have no friends—there or elsewhere. I had not even an acquaintance in the neighborhood. No one ever writes to me. Why do you ask?"

"I might truly answer, because I am very uncivil," replied Mrs. Gordon. "Solitude fosters many bad habits, and I must beg you to excuse me on that score. I will not offend in the same way again. Indeed, there is nothing I so much detest as curiosity.—Harrison, you may take the tray; we have finished."

Harrison and the tray made an exit as noiseless as their entrance, and, after the door had closed, Mrs. Gordon was again the first to speak—very pleasantly and graciously.

"Miss Tresham, I see that coincidences have left us no option but to think that we are meant to be friends; and one must never gainsay Fate, you know. Do you think you have Christian charity enough to come to see me sometimes, without exacting the ceremony of visits in

return? I am such a recluse that I cannot think of leaving my cell to encounter daylight."

Katharine looked up with an astonishment which showed itself in every line of her face. She could scarcely believe that these cordial words of invitation were addressed to herself by the same lips that had declined the visits of all the old hereditary friends who had a right to enter Morton House. The cordiality was in Mrs. Gordon's eyes as well as in Mrs. Gordon's tones, however. So, after a short pause, she answered, with the frank grace that all her life had won for her so much liking:

"Indeed, you are very kind, and I shall be very glad to come. I have few acquaintances—none who consider my society of any importance; so it would be strange if I were not flattered by your invitation. It will be a great pleasure to me to see you again when I can. But my time is not my own, you know."

"I cannot help forgetting that," said Mrs. Gordon, smiling—"you seem so little like a governess. What a disagreeable life you must find it, especially in your present situation!"

"No; very much the reverse," said Katharine, quickly. "Mr. and Mrs. Marks are both kind to me; and I shall never forget how generously they took me into their service when I was an entire stranger to them."

"It was like Bessie Warwick," said Mrs. Gordon, quietly. "I remember her in the old time as very warm-hearted and very impulsive, but rather silly. She was pretty, but so decidedly underbred that nobody wondered when she married much beneath her."

"She seems to have found her right place in the world, however."

"Most women do, or else have sufficient sense to seem as if they do. It is seldom you find one weak enough, or strong enough, to beat against the bars. Then, what are we most inclined to do—pity or scorn her? Either, God knows, is hard enough to bear." She paused a moment, then changed the subject abruptly. "Do you see much of John Warwick? Is he often at his sister's house?"

"He lives there," Katharine answered; "and yet I cannot say that I see much of him. He is absorbed in his profession, and seems to take very little pleasure in society."

"But you like him—do you not?"

"I like him extremely. He is very quiet; but no one could live under the same roof with him and fail to see that he is one of the most thorough gentlemen, as well as one of the kindest of men. I have heard that he can be very hard sometimes; but I can scarcely believe it, when I remember how gentle he is to his sister and the children."

Mrs. Gordon looked at her with a smile. "You are his friend, I perceive," she said.

"I ought to be," the girl answered, quickly, with the remembrance of what he had said to her that afternoon stirring warmly at her heart. "Ingratitude has never been one of my many faults."

"I hoped he would have married long before this," said the other, with a wistful light in her eyes, that Katharine was not slow to interpret. "I do not know any one whom I should better like to see happy—any one whom I would sooner exert myself to help along the road to happiness."

"Mr. Warwick is not unhappy, I am sure," said Katharine, almost resentfully. "He is not one of the men who have no life if they have no fireside. I think a wife would decidedly bore him. He has his clients and his law-books—that is all he wants. No one need pity him for imaginary loneliness."

Mrs. Gordon unclosed her lips, as if to reply; but, before she could do so, the door opened, and Harrison startled them by the announcement that Mr. Warwick had come for Miss Tresham.

Katharine started up at once, full of self-reproach.

"How very inconsiderate of me to have stayed!" she cried, eagerly. "I might have known they would be uneasy; and it is such a long walk to have given Mr. Warwick! How very, very inconsiderate of me!"

She repeated the last expression several times, for her vexation was not least in the thought that she had forced upon Mr. Warwick the very thing he wished to avoid, and brought him to the very house he least desired to enter.

"Don't look so distressed and penitent," said Mrs. Gordon. "It was my fault, not yours; and I am sure he will not mind the walk, especially as he need not repeat it.—Harrison, order the carriage; and show Mr. Warwick in here."

"No! no!" cried Katharine, hastily. "He has had so much trouble about me, pray let me go to him at once, and—and not keep him waiting. I shall not mind the walk at all."

She was drawing her wrappings around her as she spoke, and evidently meant to go at once, if Mrs. Gordon had not interfered very decidedly.

"I will not hear of such a thing," she said. "You must wait for the carriage, and I must send for Mr. Warwick.—Harrison, show him in at once."

Evidently, Mrs. Gordon had been accustomed to the habit of command. Her quiet tones had so much authority in them that Katharine found herself yielding without a word. She sank into her seat, and the next minute Mr. Warwick entered the room.

Whatever he felt, he certainly showed nothing beyond gentlemanly self-possession, as he came forward, meeting Mrs. Gordon's cordially-extended hand with his own, and answering her words of welcome so easily that Katharine felt relieved. What she expected, she could not have told; but certainly something unlike this. Not any faltering, or trembling, or turning pale—she knew the grave, reserved lawyer too well to fear that—but at least some token that his pulses were beating as fast as they surely must beat in presence of the woman who, for twenty-five years (if his sister spoke truth), had stood between him and all thought of other women—some token different from the quiet presence of every day, from the cool glance that saw so much, and the terse speech that said so little—yet they were all there, and as much unchanged as if Pauline Morton's eyes were not looking into his face from the grave of the past.

Presently he crossed over to Katharine and stopped at once the words of penitence with which she was prepared to greet him.

"No," he said, "you must not think any thing of the kind. I came because I wanted to—and a little because Bessie has been uneasy. You know how highly developed her nervous system is. Well, she has been arranging the programme of a very tragic entertainment—Mr. Annesley's horses running away, and leaving you senseless and bleeding in some wayside ditch."

"I am very sorry," said Katharine, too much disturbed to laugh. "It is very kind of Mrs. Marks to take the trouble to be uneasy about me—I am very sorry. I ought to have thought, Mr. Warwick; and then you need not have had all this trouble."

"I told you a minute ago that it was no trouble," he said, a little shortly. And, as Mrs. Gordon advanced, he turned and began speaking about Felix.

"He is quite the hero of the hour," he said. "In fact, he has taken Tallahoma so entirely by storm, that I hope, for the sake of example, you will not let him enter the town to-morrow—he would certainly receive a popular ovation."

"He is not likely to leave the grounds of the House for some time to come," answered his mother, gravely. "I have had a lesson by which I shall profit. Felix's management has been a point at issue between Morton and myself, and the occurrence of this afternoon has showed me that I am right and he is wrong."

"May I not intercede on the side of mercy?" said Mr. Warwick, half jestingly, half in earnest. "You will not think me presumptuous, I am sure, when I tell you that nothing so much shames, or so soon cures untrustworthiness—even the slight, childish form of it which Felix showed this afternoon—as the sense of being trusted."

She looked up at him, with a deep flush on her pale cheeks, and a sudden light in her eyes, that startled both Katharine and himself.

"You speak of what you know," she said, in a low voice. "You speak of those in whom the sense of honor, and the power of being shamed, is born. But you don't speak of, you don't know, the blood that child has in his veins. I know—and, believe me, I can best deal with it."

"Excuse me," he said, hastily. "I did not mean—"

She interrupted him. "Any thing but kindness, I know—only you don't understand. Now tell me if you have heard from Morton. I sent to inquire, and the answer was very satisfactory—but I fear he may have sent it merely to quiet my uneasiness."

"Hardly. No doubt he is well by this time, and probably will make his appearance to answer for himself to-morrow.—Miss Tresham, I am at your service whenever you feel inclined for the walk before us."

"The carriage—" began Mrs. Gordon.

But, at that moment, Harrison once more opened the door, and announced that the carriage was waiting.

"You will come to see me, will you not?" asked the lady, as Katharine bade her good-night. "I don't like to see you go, without an assurance that you will return."

"I will certainly come," said Katharine, with a smile even more bright than usual.

After a few words they took leave, and Miss Tresham found herself rolling rapidly along the road to Tallahoma, and assuring Mr. Warwick that she felt much less tired than excited by her unusual adventures.

CHAPTER XII.—THE TUG OF WAR.

THE morning after his escape from drowning, Morton Annesley woke with that uncomfortable weight on his mind—that sense of something disagreeable, either past or impending—with which every one is familiar who has ever sought sleep rather as a refuge from tormenting thought, than as that "sweet restorer" which Nature intended it should be.

For the space of several minutes he could not think what had occurred; then suddenly a throng of recollections rushed over him; he recalled every thing that had happened. He remembered the adventure at the pond, and the scene that followed his rescue; he remembered the looks and tones of the people who had addressed him; and, above all, he remembered the expression of Katharine Tresham's eyes, when, for one brief second, he glanced up into them! With a sharp, impatient exclamation, he sprang up and began to dress. Some reminiscences prick worse than needles, and to him there could scarcely have been a more disagreeable reminiscence than this. Not even Katharine's eyes could take the sting out of it! There was such a mock heroism about the whole affair, that he fairly ground his teeth over it. Some people would have enjoyed the *éclat* thus conferred upon them, while others, recognizing the ludicrous aspect of the adventure, would have laughed it off with that genial good-nature which it is the best policy in the world to affect, if it be not really possessed. But Morton, poor fellow, did not possess, and could not affect it. Which aspect of the matter—the heroic or the ridiculous—was most distasteful to him, it would be hard to say, or against which he chafed most impatiently. It provoked him to think how Lagrange had gossiped and would yet gossip over the occurrence; and it is to be feared that, in his irritation, he was not so lenient in his feelings toward Felix, as Felix's quixotic protector ought to have been. But there was a good deal of disappointment mingled with this irritation. He had taken so much interest in the boy, he had striven so hard to make him comprehend the moral obligation of a trust, and the chivalric standard of honor, that he was chilled and disappointed by his failure; and felt, if the truth must be told, not a little out of patience with the ungrateful wilfulness which had placed him in his present position. What this position was with regard to Miss Tresham, he had only a faint idea. He knew that he had said something—that he had committed himself in some way—out there beside the pond, before all those people (in his own mind, he was ungrateful enough to call them those confounded people); but what it was he did not know, and certainly had no intention of inquiring. Only it made one thing certain—he could not hesitate any longer. The tug of war—did any misgiving of his heart tell him what a tug it would be?—must come with his mother, and, one way or another, his fate must be decided as only Katharine could decide it.

With his mind full of these thoughts he went down-stairs, across the hall, and out of the open front-door. The morning was very bright, for the atmosphere had capriciously changed; the thermometer had risen from its unwonted depression of the few preceding days, and the air that greeted him was soft, as if the dead Indian summer had returned, or the spring was about to burst. The sunshine was pouring in a dazzling flood over the lawn and piazzas; the gravelled sweep before the house sparkled as if its stones had all been precious gems; the evergreens, dotted about in every direction, seemed to have put on a brighter emerald hue; and a bird that was perched on a magnolia near by, was pouring forth its whole heart in glad rejoicing that the cold was over and gone; that the blue skies, and the soft air, and the golden sunshine, had returned. We are all more or less susceptible to such influences as these; and Annesley, as it chanced, was keenly alive to them. At the first sight of the bright outer world, and the

first note of that trilling lay, his depression suddenly vanished, and his spirits rose like mercury. Almost unconsciously he caught up the notes of the little feathered songster, and, as he went down the steps and turned toward the stables, he was whistling to himself almost gayly.

He found Mr. French talking to the head groom, while one or two subordinate stablemen were rubbing down a large, black horse, that stood patiently undergoing the operation.

"Good-morning, Frank," said Annesley, coming up. "What brings you out so early? Nothing the matter with the Captain, I hope?"

"I am sorry to say there is something the matter with his shoulder," said Mr. French, looking round. "He fell lame while I was riding home, yesterday afternoon. By-the-way, how do you feel after your ducking?"

"I am well, of course," said Morton, a little ungraciously, resuming his usual manner as he went on: "I am concerned about the Captain.—Lead him out there, Jim, and let me see how he walks."

The Captain was led out, and the Captain walked very badly. Some accident had plainly befallen his right shoulder; and the two gentlemen were soon in deep discussion and examination, aided by Isaac the groom, and John the coachman. Various remedies were suggested, and one or two were tried. It was some time before the poor Captain was remanded to his stall, and the two gentlemen bethought themselves of breakfast. "You can take him to the stable, Isaac," said Mr. French, at last. "I'll be out again after breakfast and look at him. —Morton, are you coming?"

Morton said "Yes," rather carelessly; and they turned into a broad walk which led to the house. With the Captain dismissed from his mind, Mr. French remembered something he wished—or, rather, had promised—to say to his brother-in-law. "A man's opinion always has so much weight with a man," his wife had remarked to him. "You must be sure and tell Morton what you think of this nonsense." Mr. French had promised that he would; but now he began to wish that he had not been so rash. Suppose Morton were to be offended? "Hang it!" thought the other, candidly, "I should be offended myself if anybody were to meddle in my private affairs. I wish I had not promised Adela. It is none of my business if he chooses to make a fool of himself." Then he cleared his throat and looked at the abstracted face beside him.

"Are you sure you don't feel any the worse for your exploit yesterday?" he asked, by way of introduction to what he meant to say. "I should think you would, Morton."

"Why the deuce should I?" asked Morton, pettishly. "I'm neither a child nor a woman. Confound the exploit, Frank! can't you let it alone?"

"Oh, of course," said Mr. French, a little surprised. "I didn't know you were sensitive about it. I'm sure it made you rather a hero—at least in the eyes of the ladies. Some of them were exceedingly interested, I can tell you." Then, after a pause—"Morton, I suppose you know what you're about, but don't you think you may be going a little too far with—with one of them?"

"With one of them!" repeated Morton, giving a start. "Whom do you mean?" he asked, more quietly than his companion had expected. "I don't understand."

"I mean that Miss Tresham who lives in Tallahoma, and is a teacher, or something of the sort," answered Mr. French, who, as he had once begun, was determined to blunder through. "Of course, you know your own affairs best, and I hope you won't think me interfering; but I thought I would give you a hint. Young women's heads are so easily turned, and old women's tongues are so confoundedly long, that one is obliged to be careful."

"I am much obliged to you," said Annesley, in a tone which contradicted the words, for he was more angry than he would have liked to confess; "but I believe I can manage my own affairs—and I prefer to do so."

"I beg your pardon," said Mr. French, beginning to be a little offended in turn. "I didn't mean to be impertinent. I'm an older man than you are, and I thought I would give you a little friendly advice. It's a devilish disagreeable thing to be talked about as people will talk in these country places; and of course I never supposed you were in earnest about the girl. I'm confident, I need not tell you, Morton, that such a thing would nearly kill your mother."

"You must allow me to be the best judge of that," said Morton, stiffly. And there the conversation ended.

Mr. French shrugged his shoulders, and thought to himself that he had known how it would be, but that at least he could tell Adela he had done his best; while Morton walked on, with his breast fairly in a flame. So he had made such a fool of himself as that! He had betrayed every thing so plainly that his brother-in-law felt obliged to come and force his advice upon him! Indeed, it was time that he spoke, if only for Katharine's sake, since he had committed himself, and involved her to such an extent as this. Poor Morton! In his single-minded sincerity, it never occurred to him that Mr. French had been prompted to the unusual character which he had assumed. He took it simply as the consequence of his own unguarded conduct; and it confirmed rather than shook his resolution. It would have gone hard with Adela if she could have known the result of her husband's interference.

Breakfast passed off quietly, but rather silently. Adela did not make her appearance, and, although the three others talked at intervals, there was a sense of constraint hanging over them, and they did not remain very long at table. Mr. French was the first person to leave the room, taking out his cigar-case as he did so. Then Morton rose and walked round to his mother.

"Will you come to the library?" he asked. "I have something to say to you."

She looked up at him, and, in a moment divining his purpose, her heart sank. But she had sufficient presence of mind to smile into the grave, earnest eyes regarding her.

"Certainly I will come," she answered, "but I must first see Adela, and give orders about dinner—that is, if you are not in a hurry."

"I am not at all in a hurry," he replied. "If you will come when you are at leisure, that will do. You will find me in the library," he added, as he took up a paper and left the room.

He went to the library, but he soon found that he could not read. It is one thing to hold a paper open before the eyes, and quite another to pay intelligent heed to its contents. Morton did the first diligently; but, with all his efforts, he could not achieve the second. He dreaded the interview with his mother so much that he eagerly desired it to be over; and he caught himself listening to every footstep in the hall outside the door, hoping it might be hers. At last he threw down the paper, and, rising, walked restlessly across the floor.

There was not a pleasanter room at Annesdale than this library, nor one that he liked better; but to-day it might have been an irksome cage, to judge by his impatient movements to and fro. From the fireplace to the windows, and from the windows to the fireplace, he paced, until finally he paused before the latter, and, leaning one arm on the mantel, gazed steadily at an engraving which hung above it—a "St. Cecilia" he had brought from Dresden. Something in the outline of the uplifted face reminded him of Katharine. It was not so much a resemblance as the suggestion of a resemblance. But it had struck him often before, and now it brought her face vividly to his mind. By some strange perversity of association, it also brought to his recollection that day when she sang the "Adelaide" for him, when he had chanced upon the open letter, and when her strange conduct had so chilled and repulsed him.

He was still thinking of these things, and his face looked unusually grave and troubled, when the door opened and his mother entered. She crossed the room, and, as he did not turn, she laid her hand on his arm.

"You wished to speak to me, Morton?" she said. "Here I am."

"My dear mother, thank you," he answered, turning quickly. "I did not hear you come in—how quiet you are!"

"I was afraid you would be tired of waiting for me," she said, sitting down in a deep arm-chair. "Adela is quite unwell, and I stayed with her some time. I thought that, if you wanted to see me about any thing of importance, you would have told me so."

"I wanted to see you about my own affairs," said Morton, plunging headlong into the subject he now felt tempted to avoid. "I want to ask your advice about a very important matter—to me at least," he went on, faintly smiling. "Mother, I have lately thought of marrying."

The room suddenly went round and grew black before Mrs. Annesley's eyes. She extended her hand almost unconsciously, and clutched the corner of a table near by to steady herself. Her worst fears were

realized; but she had sufficient self-control to look up quietly, and say—

"Well?"

"Well," he answered, knowing that the worst could not be too quickly told, "I fear that I am going to disappoint you. I fear that the woman I love, the woman I wish to marry, is not the woman whom you would have chosen for me. But in this matter, no human being, not even the nearest and dearest, can judge for us," he said, gently taking the hand which she had laid on the table. "We can only judge for ourselves, and abide by our choice through good or through ill. Mother, will you not give your sanction to my choice?"

She suffered her hand to remain in his; but her eyes looked cold, and her voice sounded hard when she asked—

"What is her name?"

"Her name," he answered, "is Katharine Tresham. My dear mother," he continued, eagerly, "don't judge her by her surroundings, don't think of the position in which Fortune has placed her. Only judge, only think of her as you will see and love her for herself, as you will—"

He was stopped by a gesture from his mother, as she drew back her hand.

"Go!" she said, bitterly. "I have heard enough. If you had the heart to come and stab me like this, you will not heed any thing I can say to you. Go! Only remember that, if you do degrade yourself in this way, you will cut yourself off from me forever. I will never receive that woman as my daughter; I will never, as long as I live, suffer her to cross the threshold of this house!"

"Mother!"

It was a cry of astonished, grieved reproach, which at any other time would have gone to her heart; but she had now so entirely lost command of herself, and of the emotion which seemed suffocating her, that it rather provoked than allayed her anger. She had feared and in a measure anticipated this for a long time; but it did not make the disappointment any less poignant when it came—it did not teach her any better how to bear it.

"Mother," said Morton, gravely, "you cannot be yourself—you cannot be in earnest when you utter such words as these."

"Go!" she repeated, once more, in a voice choked with tears.

And, as there was nothing else to be done, he walked sadly across the floor, and stood silently at one of the windows, waiting for what would come next—waiting to see whether his mother would recall him, or whether she would leave the room with only those last bitter words.

A long time passed—an hour it seemed to the young man, and it was in reality many minutes—before any sound broke the stillness of the room. Then Mrs. Annesley said:

"Morton!"

He came to her side.

"I am here," he answered, gravely but gently.

She lifted a face that was white even to the lips, and held out her hand.

"My son," she said, "forgive me. I did not mean to pain you; but the shock was so sudden, and very hard to bear."

"My mother, my dearest mother!" he said.

It was all that he did say, but he bent down and kissed the hand she gave him, and peace—or at least a semblance of it—was once more established. After a while it was Mrs. Annesley who spoke first.

"Morton," she said, "have you considered this well?"

"I have considered it well," he answered.

"Your mind is made up?"

"My mind is entirely made up."

"You are determined to inflict this distress upon me, and to ruin your own life by such a misalliance?"

"I am determined to ask Miss Tresham to be my wife," said the young man, looking pale but unshaken. "I would have asked her long ago if it had not been that I hesitated on your account. But now it is not possible for me to hesitate longer."

"Do you mean that you have committed yourself?" she asked, hastily.

"In absolute words—no. Dear mother, don't pain me by combating my resolution," he said, with his eyes full of appeal. "Only tell me that, if she consents to marry me, you will welcome and try to love her."

"Tell me one thing, Morton," said Mrs. Annesley—"what do you know of this woman whom you ask me to receive as your wife? When a man marries he should know all the previous history and all the connections of the woman he chooses. Tell me, my son, what do you know of hers?"

She touched his cause in its weakest point, and he knew it. The thoughts he had been revolving when she entered the room—the thoughts that had sealed his lips ever since the day he saw Katharine last—rushed upon him suddenly with overwhelming force, and for several minutes he could not reply. Then the truth came in one word—

"Nothing."

"Nothing!" his mother echoed, in a tone of grieved astonishment. "Nothing, Morton? And yet you ask me to welcome her as a daughter? My son, my dear son, what can you be thinking of? Where is your sense of what is due to yourself and to your name?"

"I know nothing about her," he said, "but I can trust her. She is too pure and noble ever to have done any thing that she need blush for."

"But, good Heavens! her relations, her friends—what may they not be?"

"I do not think she has any. I have never heard her speak of them."

"And you think that a good sign? Oh, Morton, Morton!"

"It is not a bad sign, mother," said Morton, beginning to look a little less patient. "Many a girl is friendless, many a girl is obliged to earn her bread as Miss Tresham is doing. It would be cruel to doubt her because Fate has dealt hardly with her. It is true that she has never mentioned her past history or her family circumstances to me; but I have never been in a position to receive such a confidence."

"And you will ask her to marry you without knowing more than this?"

"I should be a cur, not a gentleman, if I inquired into her affairs before asking her."

"Oh, my son, what madness!"

"Mother dear, be patient with me," he said, gently. "Don't you see—can't you tell how hard I am trying to do right? If I had only myself to consider," he went on, walking again from the fireplace to the window, and from the window to the fireplace, "I would sacrifice my wishes to yours. But—but I am afraid it is too late as far as she is concerned."

"You put her before me, then?"

"I put my honor before every thing."

"Your honor should lead you just the other way," she said, lapsing from self-restraint into anger again. "A gentleman's first duty is to his name. What will you be doing with yours when you marry thus?"

"I will not be degrading it," answered he, firmly. "Mother, you do not know Katharine Tresham. If you did know her—if you would know her—you could never speak of her in this manner."

"She has taken you from me, Morton. She has stealed your heart against all my entreaties; she has made you forget what is due to yourself—how can I do other than hate her? How can I stand by silently and see you marry an adventuress?"

"Mother!"

The exclamation was so stern that for a moment Mrs. Annesley shrank. But, before she could speak, Morton gave a great gulp, and hurried on:

"Forgive me, but this had better end. There is no good in prolonging a useless discussion, and I see now that this is useless. I only provoke you, and am pained myself. So I will go. Don't forget that I am very sorry to have grieved you, and, if possible, still more sorry to act against your wishes for the first time in my life."

She let him go—as far as the door; but, when his hand was on the knob, her voice called him back. He returned at once, and, rising, she met him half-way.

"My son, forgive me," she said. "You have never in your life before grieved or disappointed me; you have often given up your will to mine; you have never once failed in respect or duty to me. It is only just, therefore, that my turn for sacrifice should come. I never thought it would be so hard; I never thought you would desire to throw away

your happiness in this way. But, as you will do it—why, take my consent, and God bless you!"

The young man caught her in his arms with something that was almost a sob.

"Mother, my dear, kind mother!" he said. "You don't know how much I longed to hear those words. Thank God, they have come at last!"

He thought the tug of war was over; but, as he clasped his mother in his arms, it would have been strange if he could have known—if he could even faintly have imagined—how completely she had outwitted him, and how the worst struggle was yet to come!

[TO BE CONTINUED.]

SNATCHING A HOLIDAY.

"Now, Eumæus, give ear, and my other friends near,
A tale somewhat vaunting I pray you to hear."

ODYSSEY, xiv., 402.

TWO summers ago, I was searching a very vexed title on Murray Hill. After a time, a truce to my perplexities seemed possible if I could procure the signature of a certain lady, living somewhere on Long Island, to a release of right to purchase.

The matter was a delicate one, and I could trust nobody but myself. Moreover, it was charming June weather, and a run in the country would do me good. So I set off. I found a region, not many miles away from the metropolis, which I have never seen written up in guide-book or vacation-book, and among whose aboriginal inhabitants, and bright, untrodden hills, I spent one of the oddest and most exhilarating holidays—for, though in the line of business, it was a real holiday in my life.

Long Island is truly a remarkable region. The edge adjoining New York is fringed with cities, lying in wealth with the metropolis itself. But penetrate inland a few miles, and you run into a long, flat, swampy track, with plateaus of dry and high land at intervals, upon which the poorer classes of New-York mechanics build their homes, spending their lives thenceforward in getting in and out of the city, and shaking with the chills-and-fever, that nightly rises from the miasmatic swamps, and sits brooding like a ghastly nightmare over the whole land. Farther on, toward the south shore and the open ocean, the ground is higher, and resembles, as I shall have occasion to remark again in this article, the aspect of New England. I am told that, within sixty miles of the New-York City-Hall, wild deer are still to be found among these rounded hills.

Over this island, in search of a lady who might have been a myth, for all I knew, through this ague-land and fever-land, I took my solitary way.

My outfit consisted of just such clothes as I wear in my office and in my ordinary walks in and out among the children of men—a Scotch-tweed summer overcoat, companion of many a ramble among the fish-swells of Gloucester, and the argot and argonauts of Marblehead, and a light-silk umbrella, with a natural root-handle very nearly the weight of the umbrella itself, which appears to have sprouted complete therefrom, a slender reed or mushroom full blown, according as it is shut or opened. Mr. Murray, in his delightful, though, I fear me, somewhat Hesperidean and roscate fables of the Adirondacks, is wont, not only to tell us of his outfit taken in detail, but what he paid therefor, and the name of the tradesman who sold it and Mr. Murray at a single bargain. Suffice it for me, that I found both the above enumerated treasures within a radius of ten rods around Union Square, proposing, in my Anabasis, in the spirit of General Pope's order, number one, to live on the enemy.

At the foot of James Slip, East River, New York, there was, at the date of this chronicle, and is to-day, if the wasting breath of Time has not consumed it, a shed, about five feet square, or rather, I should say, five feet crooked, which boasts of a door opening upon South Street. Over this door may be detected, on a clear day, the legend, "Long Island Railroad, Passenger Rooms." A superficial observer might suppose that these "rooms" were christened in the same generous spirit in which the ample-hearted Mr. Richard Swiveller spoke of his garret, as his "apartments;" but I have had an opportunity of examining, and can distinctly asseverate that there are *two* "rooms," thus confounding the superficial observer aforesaid, and justifying the plural. The second "room" is, I should say, *one foot*

square, into which is fitted an unhappy man, who sells tickets through a hole in the wall to his partners in misery, the passengers dove-tailed together outside. At certain hours during the day, a ferry-boat, once, I have no doubt, both new and seaworthy, leaves a slip in the near vicinity of these passenger-rooms, and, after a perilous voyage up the East River, lands her surviving passengers at Greenpoint, whence, if their hearts are brave, and their spirit has survived to them, in the face of these repeated terrors, they can take the Long-Island Railroad to Greenport. Our boat, after several blind plunges at the slip—which sounded to me like the refrain of the old song:

"If it was na weel bobbitt, weel bobbitt, weel bobbitt,
If it was na weel bobbitt, we'll bobbitt again!"—

landed us, and I took my seat in the cars, which are both clean and comfortable, and so very unexpectedly so, after previous experiences, as to cheer one up amazingly, and make him feel as if youth and hope were not altogether delusions and snares.

I stretched myself upon the welcome cushions, and felt rattled along at as good a rate of speed as I could wish. There had been a camp-meeting somewhere among the abounding swamps and Sloughs of Despond, which I could not but feel to be the correct and proper thing in the premises, and on that account restrained my grumbles at being stopped every seven minutes to take on board the good people, who appeared in little squads at the most unexpected places, stopping the train wherever they pleased, as if depots were such merely optional conveniences as to be beneath the attention of respectable citizens.

I remember particularly one place where the train stopped. Not a soul was in sight, and the single track was fenced in for miles by a wall of rushes, at least six feet high. Judge of my surprise, to see the aforesaid wall parted, just as the fairy in the pantomime parts the curtain at the most unexpected place, by a swarm of camp-meeting *habitués*, who climbed, single file, up the embankment, filling the car almost too deep—and certainly too deep for comfort.

Greenport is a New-England fishing-town—if ever there was a New-England fishing-town out of New England itself. The Long-Island Railroad terminates on a little pier built out into the water, whence you foot it to the hotel. I went to bed with a rush-light, in a room with no lock to the door, and no door to speak of, either. The march of modern improvement had placed a bell in the tavern, and it was hung in the main hall, where all the boarders could get at it. This was not bad, the only consequences being a knock at my door every ten minutes during the night to know if I had rung—my door being nearest the aforesaid bell, which must have kept up a cheery jingle in the bar, if the tattoo on my panels was any criterion.

In the morning I was awakened by an altercation in the back-yard, under my window, between the 'ostler and the "boots," as to whether the elephant, in a circus which had lately visited the town, had or had not danced a polka on his ear; the 'ostler so affirming, while the "boots" maintained that it was clearly impossible, and that it must have been the camel. I heard this whole dispute somewhat at a disadvantage, but am confident that the merits are as I state them. Breakfast would not be spread for an hour, so I strolled down to the water's edge. Imagine a city man looking at a sunrise! That was one of the few I have seen in the course of a somewhat eventful life. But what a one it was! All sunrises are glorious, as I am informed and believe.

But here, on a precious June morning, over waters so cool and green that I imagine Long-Islanders have striven to embalm their estimation of that pigment by tacking a "green," by way of prefix, upon every thing of which they have had the christening within a hundred miles, the splendor that the sea gave back was like another sun. Here was Nature in her Sunday clothes, and only I alone to enjoy her!

Rocking before me were one or two respectable schooners, and a hecatomb of fishing-smacks, their graceful strips of sides painted red, blue, yellow, and, above all, green, and their white sails reefed up, or swinging listlessly in the half-breeze. The water was rolling in pretty swells toward the shore, mixing up the fish-boats, and toppling the tall masts of the schooners. I could not forbear, and, stripping so much of myself as was proper, I took a little splash, and felt at home in the mild brine.

The crowning industry of the people up here seems to be the "manufacture of fish," so called. They certainly succeed in manufacturing a most villanous stench, and, if smells are good fertilizers, I cannot conceive of a country where broom-corn would grow higher,

or cereals yield more bushels to the acre, than in the vicinity of Greenport.

I understand these fish-factories to be establishments for the conversion of fish into manure. What they do with their manure, after it is converted, I have not the first conception, for I saw none of it being moved in cars or wagons, but, on the contrary, great heaps of it, breathing pestilence and breeding corruption, all over the country. There is a huge "fish-factory" constructed of hulks of old whalers, anchored just opposite Greenport, whose inhabitants can get up early, as I did, and revel in an exhilarating breeze from the sea, when, if they can detect any thing but the nasty breath of the "fish-factory," it must be the result of long practice, and a stronger stomach than mine. Still, I am New-Englander enough to admit that the odor of aged fish is very healthy.

What an invaluable ally of man is this same finny tribe! They are food for his table, sport for his rod, a dressing for his land, and aliment for his canary-birds! Besides which, I have seen at Mackinac great fatty sturgeons piled up like cord-wood on the wharf, and used to feed the furnaces of the great lake propellers.

Now, all animals are more or less available to navigation, but I maintain a fish to be the only living thing capable of use as fuel. True, the early Christians were utilized in that line to some extent, and we know that King Nebuchadnezzar once so experimented upon three Hebrew gentlemen, sparing no pains to make his experiment a success; but it was not. They would not burn.

Returning to my tavern, I had one of the best breakfasts I ever swallowed, delicious clams, delicate water-cresses, with butter sweet as honey and yellow as the sunrise I had seen.

Being perfectly aware that whatever excess of breakfast could be stowed away now would stand me in good stead about supper-time—dinner I did not look for—I did all these dainties ample justice.

Before leaving Greenport, I want to say a word for and about it. It is a good place to wear out old clothes in—easy-fitting old clothes; and to go about in wide, roomy slippers. Everybody takes life so easily there, talks so leisurely and composedly, rides, walks, drives, eats, drinks, and communicates information, so slowly and serenely, that I can imagine a tight boot or collar never exists there at all, and would not be tolerated a moment.

Mine host at the hotel—I have forgotten his or its name, though both stared me in the face from a square sign-board that creaked from a traditional pole well into the street—was a homely and hearty inn-keeper of the olden time. Civilization—or, as Washington Irving would say, the barbarisms of civilization, railroads, steamboats, and palace-coaches—have driven off the old way-side inns, where the host gathered his guests before the open chimney, and with his wife, standing with pink arms akimbo, for one of his auditors, spun long-winded yarns to their edification and his own, while the guests responded to the compliment by cramming the old fellow up with all sorts of cock-and-bull and fish stories for his next audience. But here, inside of a hundred miles from New York, was one of the last of the stock. He took care of me like a son, piloted me down to the dock, put me aboard the "ferry," and waved his fat hand as I glided away. All this in consideration of the modest pecunium which was all he demanded for my keep.

The eastern end of Long Island is shaped like the distended jaws of a sperm-whale. I have no doubt but that the country has grown so on account of the people around there having been more or less intimately related to sperm-whales until very recently.

On the upper jaw of this whale, just where the lip begins, to pursue the conceit, and looking out upon Long-Island Sound, is Greenport.

The lower jaw terminates in Montauk Point; under the chin, with its long range of beach, on which the unbroken waves of the Atlantic spend their fury, are the Hamptons, South and East, while the *chasm* of the mouth has its apex in Riverhead, perhaps fifty miles inland.

Right across this whale's mouth, like props to keep the jaws apart, lie Gardiner's, and, farther inland, Shelter Island. Between this latter and the main land, is Great Peconic Bay; between Gardiner's and Shelter Island lies Gardiner's Bay.

All this region was formerly the hunting-ground of the Shicococ, Cochang, Manhasset, and Montauk Indians, and after them, and until November 30, 1664, Governor Winthrop having discovered at that date that this land was included in the Duke of York's grant, under the control of Connecticut. I amused myself with conjecturing how

strong must have been the personality of that hardy Puritan race, that they could have managed, in so short a time, to have stamped their likeness upon every blade of grass, every tree, rock, fence, and farm-house, in Suffolk County.

I found these islands as green and lovely spots as ever eye of man could rest upon.

The water in these bays and inlets—for the islands are penetrated, every few hundred yards, by bayous—is as still and mellow as the sky itself, and is, in almost every case, fringed with a broad beach. A summer-house or shooting-box, built here, would command every beauty that Nature can bestow on summer-houses, and command, besides, fishing, hunting, yachting, and bathing, of the best.

Gardiner's Bay reminds us of William Kidd:

—"as I sailed, as I sailed,

My name was William Kidd; as I sailed,

My name was William Kidd, and God's laws I did forbidd;

And so wickedly I did, as I sailed." *

Greenport lies, as I said before, on the upper jaw of our sperm-whale, while just opposite, about three miles off, is the upper end of Shelter Island. At rare though not entirely supposititious intervals, a citizen of Greenport will feel moved to visit Shelter Island, which remote contingency has been foreseen by an ancient mariner who is too old to fish. For fishing I find to be, out here, the second duty of man. The youngers all go to sea until they are thirty, stay at home and fish until sixty, and then live, until they shuffle off this mortal coil, under their own vine and fig-tree.

This ancient mariner, then, being too old to fish, maintains an intermittent ferry by means of a fishing-smack, such as I saw before breakfast. I climbed into it, down the black timbers of the wharf; the skipper lighted his pipe, trimmed his sail, and we glided away over the crystal water.

This little ride of five miles was the loveliest of my trip. Ever

* Mr. William W. Campbell, in a late work, has, after the manner of the iconoclast Gould, who assures us that such a man as William Tell there never was, proved that Pirate Kidd was no pirate at all, but an unfortunate man—the scape-goat of his noble partner's, the Earl of Bellamont's, sins. But, be that as it may, *à propos* of Gardiner's Bay I find the following in "A Sketch of the First Settlement of the Several Towns in Long Island," etc., by Silas Wood, Brooklyn, 1834:

"William Kidd, who was commissioned in 1696 to go against the pirates who then infested the seas, became a pirate, sailed to Madagascar, and ravaged the sea and the coast from the Red Sea to the coast of Malabar for nearly a year, when he returned with more valuable spoil than perhaps ever fell to the lot of a pirate. On his way from the West Indies to Boston, he anchored in Gardiner's Bay, landed on the island, and buried a box of gold, silver, and precious stones. The owner of the island was intrusted with the secret, and his life was the pledge of its security. Kidd made similar deposits in other places along the coast. On Kidd's arrival at Boston, on the 1st July, 1699, he was seized and committed by order of the governor, the Earl of Bellamont, and among his papers was found an account of all his deposits.

"Commissioners were appointed to collect and secure them. They called on Mr. Gardiner for the box that was deposited on the island, who, after he was assured that Kidd was in safe custody, and not likely to be again in a condition to injure him, produced the box, and delivered it to the commissioners.

"Kidd was sent to England and tried, and executed May 9, 1701. The tradition of his having buried treasures along the coast, unaccompanied by the history of their discovery, has given rise to the idle practice of money-digging, under the impression that those treasures are still to be found.

"Among the papers of the late John L. Gardiner, Esq., is an account of the treasure deposited on the island, taken from the list of Kidd's treasures which were secured by the commissioners, as follows:

"Received, the 17th inst., from Mr. John Gardiner—			
Three bags of gold-dust, containing..	136 oz.		
Two bags of gold bars, " ..	501½		
One bag of coined gold, " ..	11	and silver 124 oz.	
One bag of broken silver, " ..		173½	
Two bags of silver bars, " ..		521	
Two bags of silver buttons and a lamp.		29	
One bag containing three silver rings			
and sundry precious stones.....			4½ oz.
One bag of unpolished stones.....			12½
	648½	847½	17½

"One bag containing one piece of Bristol and Bezoar stones, two cornean rings, two small agates, and two amethysts."

"Which account was presented by Samuel Sewell, Nathaniel Byfield, Jeremiah Dummer, and Andrew Belcher, Esqs., commissioners appointed to receive and secure the same, under oath, to the Earl of Bellamont, Governor of Massachusetts."

This is only a part of the first of thirteen sheets in which the whole account is contained, as it is certified by H. C. Addington, Secretary of State, July 25, 1699.

and anon we would sail into the shadow of one of those green hills of whose cool charms for my tired city eyes I cannot say too much, when the water would be black as Erebus; then, a moment afterward, into the sunshine again, where it was of that tender sea-shell tint of green whose like I never saw before, and have never seen since.

My Charon landed me on Shelter Island, alone with my cigar, my umbrella, and myself, and, after having briefly directed me to walk up the hill, where I could find somebody among the farm-houses to carry me to the next ferry—for there is a second island, lying end to end with Shelter Island, and with it forming the imaginary timber across the whale's mouth—relighted his furnace—i. e., his pipe—and ho! again for Greenport.

Some time after this I was one of a party of gentlemen who were discussing the relative merits of motive powers. They spoke of wind, steam, water, air, gas, and electricity; but I was the only one among them who had ever seen a vessel propelled by tobacco.

I worked leisurely up the hill, too complacent in the delicious morning to take note of time. Everywhere the likeness of this country to my native New England forced itself upon me—the apple-trees along the road-side, the stone fences, the houses—when there were any houses at all—of the old-standard pattern, one colossal chimney over two windows on each side, and five above the front-door.

I cannot imagine our sires daring to live in a house with less or more windows or chimneys. Horseshoes would have availed naught against witch or goblin, had this orthodox architecture been varied. I am positive there must be a blue law somewhere on the subject.

In this region, it is true, the fields are not macadamized with bowlders, nor the sheep's noses filed down to penetrate between them, as in some parts of New England; but this is, I believe, the only exception to the resemblance.

There was, upon the day of which I write, a certain old farmer, who for a consideration was willing to prop up between the thills of a crazy superstructure on four wheels the leanest horse I ever saw, where, supported on both sides, and once under way, he (the horse) worried us across the island pretty well, considering the amount of flesh on his back.

It seemed to me, as we jogged along among the apple-orchards and wind-mills of this primeval country, that I had somehow fallen asleep on Prince Agib's magic carpet, and been borne backward to the days of the Puritans. The old man at my side was mute as one of Hendrik Hudson's nine-pin players among the Catskills. I had tried to make him speak at first, but without avail, and finally had relapsed into silence myself.

What with the stillness and the hard board seat, I grew uneasy; the sphinx at my side began to take shapes out of the *Magnolia Christi*; I conjured him to be one of the regicides, like him who whilom appeared to the beleaguered faithful in Deerfield Church. Anon his beard became frostier, and his old slouched hat became a cockle-shell. I seemed to have struck upon the long-lost Isle of the Puritans, which, tradition says, is floating off this coast; and the impression was assisted by the windmills—orthodox erections, such as we have grown used to in the publications of the American Tract Society, wherein, besides this primitive land, they do now alone survive—and the wells, with their long sweeps standing up against the sky like an arc of ninety degrees, with its cosine and tangent.

At last the sphinx pulled up his Rosinante upon a long, low, crescent-shaped beach, beyond which spread the same apple-green water, with the shadow of the hills upon its breast, and left me to my fate.

"You kin," he said, breaking the long silence from a sense of duty—"you kin throw up yer hat, or wave yer handkercher, an' maybe like they'll see ye on t'other side, and fetch ye across."

With such words of friendly counsel did he leave me to myself.

The reader will perhaps have perceived ere this that my umbrella, the principal item of my outfit, had been, up to this time, entirely ornamental. It now became useful as well. I tied my pocket-handkerchief around its knobby neck, and, standing where the island ended and the wave began, waved prodigious salutations to the other side—but of no avail.

After ten minutes of this performance, I grew weary, and looked about me for a seat. I had noticed a little graveyard, about a furlong back, and overhanging the beach just in a lawn of clover and short grass. I had picked up an apple or two in my ride, and, as my brisk travelling had begun to stir up an appetite within, I determined to find my way back to the graveyard and eat them. As a rule, I dis-

like graveyards—what are they but harsh and dreary reminders of the time, already upon us, when we shall lie in one of them? and these reminders come soon enough to us all. Who can care to visit a spot where the bloom of every flower, the floss of every leaf, the sap of every tree, is part and parcel of a human life that was—is part and parcel of the friend we loved, perhaps?

I, for one, do not care

“To think of summers yet to come,
That I shall never see;
To think there is a flower to bloom,
Of dust that I shall be.”

So I speedily finished my apples and my elegy in a country church-yard. And now my repetition of the umbrella and handkerchief feat was crowned with success, for I saw a sail-boat pushing out from the opposite shore. As its keel grated on the beach, I jumped in and encountered a man who was destined unconsciously to figure in a great many after-speculations of mine. Mentally and physically there was in him much food for marvel. He was tall and spare, angular and bony; he had a long nose; eyes clean buried behind iron-gray tufts of eyebrows; short, scrubby, gray hair; beard and whiskers which grew clear down his neck, enveloping it down to his breast in muffler of odious-looking grizzle. His shirt was of white stuff—that is, I suppose the stuff was white when the shirt was made—and his trousers of coarse blue; to these add a fraction of hat, and you have the man's wardrobe.

Seeing my new friend was more communicative than the last, I began: “I am on my way to Sag Harbor; can you tell me how I can get there?”

“Where do you come from?”

“Greenport.”

“When?”

“This morning.”

“How d'ye get on t'other side?”

“I drove over.”

I began to think it was about time to receive a response to my one question, having answered three of his. So I repeated, “Can you tell me how to get to Sag Harbor?”

“Wall,” replied the strange customer, “it's nigh on to seven mile there”—this very deliberately indeed.

“Can't I find anybody who will drive me over?”

“Yes; I guess you might.”

“Whom shall I ask?”

“Wall, I don't know but I might drive you over myself, only daddy won't let me take the horse. How much 'u'd ye give me to drive ye over there?”

I hope the reader will note that he was a full-grown man, nearly sixty years old, and yet in wholesome fear of his daddy, such as we New-Yorkers cannot hope to impress upon our three-year-olds. The conversation continued:

“How much do you want?” I asked.

“Will you give me fifty cents?”

“Yes.”

“Wall, I don't know but what it's worth the resk. Guess I'll resk it, anyhow.”

This strange manner of man lived with his “daddy” aforesaid, his mother, and one brother, in a little frame house, one side of whose roof came down to within five feet of the ground. I had and still have a consuming curiosity to see that “daddy.” How old must he have been, and yet how strong! How vigorous in mind and body to have inspired such a dread of his displeasure in his old boy! My only regret is, that we didn't run afoul of him on the way to Sag Harbor, though perhaps it would have been annihilation to me. I wonder if he let his boy have that fifty cents for spending-money, or whether it was confiscated at sight? I wonder if he'll let him have his own way when he grows up? When we touched the shore, my queer friend, having ascertained that his “daddy” was away from home, announced that he would drive me over to Sag Harbor, and I went in-doors to rest until he should be ready to start. The farm-house seemed to consist of one room, which was kitchen, parlor, dining-room, and bedroom, all at once. “The boys,” my friend and his brother—I understood them to be nearly of an age—slept together in the garret, which was reached by a ladder in the corner.

Feeling thirsty, I asked for a drink. “There's the mug,” said the old lady, “and” (pointing out of the window to where an old-fashioned well-sweep was visible about sixty rods off), “there's the well—you

kin drink all you like.” I took my mug silently, when the old lady had an after-thought. “If you be a-going down there, you might take that 'ere bucket along and fill it;” but this proposition I failed to consider, and set out contentedly with only the mug.

My juvenile companion had meanwhile put two healthy horses before a farm-wagon, spread a miniature bed-ticking (I haven't the remotest idea what use it could have been), upon the hard and springless seat, the agreed honorarium was paid, I lighted a fresh cigar, and mounted for my ride.

The island is a beautiful succession of teeming farms, usually put into oats and hay, as I judged, and wearing that same rolling contour which I had admired on Shelter Island.

My queer friend had filled his pockets with “doughnuts,” and, hospitably offering me one, I found it quite palatable, and put away another. Mind you, I had not broken fast, save with my apples among the tombs, since seven, and it was now twelve o'clock.

We took a *détour* of about eight miles to avoid meeting my friend's “daddy,” who had gone to Sag Harbor with a load of “garden-sass.”

The village of Sag Harbor lies on an arm of Gardiner's Bay, partly in East and partly in South Hampton townships; we approach it over a long bridge, or causeway, built of rough logs, across an inlet of the bay. The tide was out, and the mud was strewn with stranded yachts, yawls, and smacks, and the accumulated *débris* and little pools of bilge left by a sea-tide, and the fresh salty smell of algæ, so grateful to a son of the sea-shore, greeted my nostrils.

Sag Harbor was, years ago, the third port of entry in the Union as regarded the whaling-trade; to-day, the battered sea-sick hull of her last whaler, dismasted and keeled over, lies abreast of the town, the copper being stripped from her sides by the enterprising firm which has bought her for junk. The decline of the whale-fishery has been the death of Sag Harbor. In 1840, her tonnage was 20,405; in 1850, 12,808; in December, 1864, 1,882; of which 1,829 was in the whale-trade; and I suppose to-day that her occupation is altogether gone.

I want to stop right here to put down a story told me concerning this solitary whaler mentioned above, that looms like a great black kraken over the doomed seaport. I met, on my return to New York, on board of the little steamer *Escort*, a very intelligent gentleman, now a merchant in Brooklyn, but born and reared in Sag Harbor, and who, therefore, as a matter of course, had been on a whaling-voyage. I have never seen him since we climbed ashore at New York; but, if his eye ever meets these pages, I trust he will let me know of his whereabouts.

Once upon a time, when Sag Harbor was rich in whale-oil, there lived a certain skipper who possessed, among other treasures, a beautiful daughter. The father had grown rich in the sperm-fishery, thirty of his vessels were cramming their sleek sides with blubber in the northern seas, and ashore his smiling farms and fat hay-ricks were scattered far and near.

Now a certain youth there was who had long nursed his bashful love for this beautiful daughter, until, emboldened to confess it, he had been blessed by a responsive avowal of her own. But boy and girl alike felt instinctively that the stern, rich old man would never hear of their wedding, and so the old, old story of stolen love and hopeless kisses was acted over again, until, one day, all was discovered, and the boy was packed off to the only penitentiary the village knew, their Alma Mater, but their Nemesis as well, a whaling-voyage.

For two long years our hero pined before the mast; but, with a brave as well as a tender heart, most manfully he strove to do his duty. Knowing well the only way to his lady's hand—her heart was his already—must, so to speak, be carved through solid blubber, and could never be travelled by blubbering with his eyes alone, he did what he had to do well, and came back second mate of the craft where he had shipped before the mast.

Proud in his own self-consciousness, he boldly demanded his bride. But the old man only laughed in his face. “Poh, poh!” said he, “my daughter owns a fleet of whalers, and a hundred men as good as you. Why should she marry you, when she owns you without?”

“Sir,” said the brave boy, “she loves me; but I will not ask her for that alone. You shall see what I can do. If you will give me the command of one of your ships, I will bring you back, in one cruise, three times the wealth your captains bring you now, or release my claim to your daughter.”

“That is bold talk,” said the skipper, “and I should like to put you to the test; but I have no ship at home.”

"Well, sir," said our hero, "if you will build me a ship, I will pay for it in a single voyage."

"I like your spunk," said the old man. "I will build a new ship, and, if you pay for it in one trip, you shall marry my daughter, if she will marry you. But, while the ship is building, you must not see her, and she shall be at liberty to forget you, if she wants to."

These were hard conditions for a loving heart, but Jacob served fourteen years for Rachel, and our hero could serve three. This was the story. The ship was built and paid for. In the fulness of time the wedding was celebrated, the old skipper turned up his toes, and the story of bride and groom had literally the conclusion we used to give to our childish histories—"and they lived in peace and died in a pot of grease"—and there is the identical ship to-day "to witness if I lie."

Sag Harbor in those days was a busy, bustling town, her streets full of strangely-dressed men, toilers of the sea from under every sky. Sag Harbor to-day has dropped into that eternal sleep from which it may never waken more. As I rode along the quaint and stilly streets, "Here," thought I, "one could live forever, devoutly believing in the Marquis of Carabas, in William Tell, Captain Kidd, Pocahontas, and the Man in the Moon; in the horrid 'maelström on the coast of Norway,' down which were pictures of full-rigged ships sailing perpendicularly, in our first geographies; in Hell-Gate and its perils, and in every darling fiction, of which the soft-tongued Southrons say 'Se non è vero, è ben trovato,' but which this sad iconoclastic age has battered down with doubts."

Once upon a time there sat, at the intersection of two thoroughfares, in the ingenuous city of Boston, a deaf old organ-grinder, from "morn till dewy eve," discoursing popular harmonies, and solaced by occasional cents, until some waggish stranger—he could not have been a Bostonian, perhaps he was a New-Yorker—cleverly extracted, one night, the bowels from his instrument. But the all-unconscious grinder sat next morning, placidly as ever, on the curbstone, grinding away the most grateful silence, until an examination, induced by the unusual harvest of pennies, disclosed the trick. Historians tell us, however, so profitable had his toil become, that he forbore to replace the lungs of his Cecilia, but sits there to this day grinding peacefully away at nothing at all!

Even such, methinks, must be the life of a man in the quiet town before me, where noise and bustle are forever banished, and where life, as it slips along, gives no sound to warn the poor wretch of its decadence.

Even so, grinding away at nothing, and producing naught!

I have mentioned that, in approaching Sag Harbor, we crossed a long, low bridge, or causeway, over a bayou of mud, that at high tide became an arm of the sea. Just discernible to one who cares to hunt for it, is a long black timber, embedded in the slime, which tradition tells was once the keel of a ship, and over it has been treasured up the following legend:

Once upon a time there arose a mighty wind from the sea, and a whaling-vessel, homeward bound, was driven clear up here, where she lay high and dry. For long years it remained, until at last the masts had fallen or been borne away, and a huge fissure in the side, broken by shipwreck, became enlarged by time and the small urchins of Sag-Harbor parentage, who were wont to make the old hulk their play-house at low water.

One dark night, two of the small boys aforesaid, who had been belated in the woods on the other side, were hurried home by a tremendous crash of thunder and a sudden brightening of the sky, the whistling of the winds, and the ominous flashes of lightning. Just as they were crossing the causeway a remarkably brilliant flash of lightning made every thing around them visible, and, to their surprise, they saw the old hulk upright on her keel with her three masts in their places, full rigged, and standing out under full canvas.

After the flash which revealed her had subsided, the boys were still more astounded to see that from the huge fissure in her side there gleamed a strange and brilliant light. All trembling with fear, yet, goaded by that curiosity which in boys with easy consciences can overcome even terror, they crawled up until they could see through the fissure right into the hold of the old ship.

What a sight met their gaze! The hold was full of men, strange, shaggy-bearded, coarse-handed, swarthy men, such as they had seen old salts fresh landed from a three-years' cruise.

They had evidently just boarded a whale, and were busy stowing

away the blubber in barrels, tubs, and casks. Some were filling great hogsheads with creamy oil, pouring it from huge dippers with long, greasy handles. Long tackles depending from the decks above were laden with lumps of blubber, which were unloaded and sent up again by the silent, ghostly crew.

Not a word was uttered. The captain gave his commands by nod and beck, and the men who headed up the well-filled barrels struck with noiseless hammers on wood that gave back no sound in return.

Lost in amazement, the boys stood with eyes riveted to the wonderful vision. At last, emboldened by the silence, one of them stirred in his place. In an instant the ghostly business ceased, and every one of the spectre crew turned and gazed upon the intruders. Paralyzed with an awful fear, the boys fainted. When they came to themselves all was dark and black again, and, with dizzy heads and heavy feet, they managed to gain their homes.

Their story was first laughed at, then tolerated, and before morning the town settled in its full and confident belief. Many began to bethink themselves of, and to testify to, strange sounds in the whistling of the wind, like the shouts of sailors on shipboard, and, not fancying to be outdone in the marvellous by mere boys, essayed more or less blood-curdling reminiscences in the interest of the commonwealth.

Strangest of all, at daybreak, when a wondering crowd sought the scene of the wreck, it was found to have gone entirely to pieces. Huge scales of its sides lay about; its ribs had been carried off to various distances; but only the rotten keel lay undisturbed in the slough.

From that very day, say the wisecracks, the whale-fishery of Sag Harbor—its sole and only wealth—began to decline. Ship after ship came home empty; news upon news of whalers lost at sea with all on board; and, finally, the last of the fleet—her occupation gone—came home and anchored opposite the wharf, as I have seen, and faithfully chronicled.

The streets of Sag Harbor are just what they should be in so sleepy a town. Long rows of elms line them, green lawns and antique houses border them, and here and there a quiet church-yard peered its white eyes out upon us, as if old "Tempus Edax" could not let a single calm elapse without a monition of the eternal debt we owe to Nature and to him.

Everybody I met in the streets was walking leisurely; there was nothing in the world for them to hurry about. Verily, as in Tennyson's "Lotus-land," "it seemed always afternoon."

On a green lawn I came across some pretty girls playing croquet. That brought me back to the modern world again, but for that I might have slept with Rip Van Winkle.

I am very grateful to those pretty girls playing croquet. They woke me up, and set me about my business.

When I came to bid good-by to my Fidus Achates, he, learning that I should, in all probability, set out for East Hampton in an hour, and having, in the distance at which he found himself from home, lost that wholesome fear of his daddy which had kept him until now in a kind of tremor, proposed to hold on, drive me there himself, and turn another honest penny.

Inasmuch as the stage-coach from Sag Harbor did not leave until late in the evening, I readily and, as the event proved, fortunately agreed—for a little questioning determined me—and in a short time I was back again on the ticking, and ho! for East Hampton.

And now I could distinguish the far-off music of the sea, like the hum of the sea-shell pressed against my boyish ear, or as on our knees we hear from the far-off cloister the last sublime amen dying slowly away in the wail of the organ.

On we go over roads high-walled on either side with willows, and at last I feel the sea-mist wetting my cheek, and I am in East Hampton.

Here my journey ended, for here I found the lady of my errant search. East Hampton is a well-known watering-place, and needs no description from me. Along the broad and quiet beach stand the old farm-houses shaded by the older trees. I do not believe there are anywhere else in the world such grand and massive elms, pensive in their solitary state, as if brooding over the changes they have seen.

Beyond that beach is the open and the trackless sea. This is Ultima Thule, and there is the wailing waste of brine.

And even now, as I sit in my office, among briefs, and notices,

and orders to show cause, there come to me glimpses of that quiet sea-beach at East Hampton where the sea-weed still blackens in the sun and mist—still blown by breezes from the mournful Atlantic—and far beyond it the sea still wailing its ceaseless monody.

JAMES APPLETON MORGAN.

MONOGRAMS.

THE present mania for these engraved conundrums is only a revival. After a suspension of two centuries or so, the epidemic is having another run. These devices can be traced back to early ages—to the Greeks at least, and possibly to Egyptian parentage. Derived from two Greek words signifying *sole*, or *only*, and *letter*, they are defined as “characters, or ciphers, composed of two or more letters interwoven, being an abbreviation of a name.”

Some modern engravers dispute this, and say that the true monogram should be so contrived that any two of its letters, if not all, should have some portion in common. Thus the diphthong *Æ* is a true monogram, and as such it may be held as embracing the four initials *A E F L*, in any desired order; albeit there is a shadow of a theory that in these combinations the initial of the surname should be the most prominent letter.

Without splitting hairs, however, over niceties of definition, it is true that many of our modern monograms are not “abbreviations of names,” but merely intertwined initials, or what dissenting engravers call a cipher, and, like the Dutchman with his riddle, one wants a “schlate und bencil” to decipher them.

Monograms were used on the coins of the old Greek cities by the early Christians, by the Carolingian sovereigns; the “merchants’ marks” of the middleages were often monograms, as were the devices on tradesmen’s tokens, the signatures of old painters, and printers, while they are by no means unknown to modern publishers. The subject furnishes its share of interest to the antiquarian, and a few years since there was published in London a little volume on “Monograms, Ancient and Modern; their History and Art-treatment, with Examples,” etc.

As a means of handing down one’s name to posterity, they can hardly be considered perfect successes. A monogram of an old painter, comprising a *P*, a *C*, an *L*, and a *D*, as far as I can make out, has puzzled the readers of *Notes and Queries*, and has been ascribed to Peter Quast, Lewis Crosse, Sir Peter Lely, and I know not how many others.

At the present rate of display among our people, the monogramaniacs will soon run out of localities on which to manifest their love for letters. From seals and rings, jewelry and watches, cards and note-paper, plate and carriages, they have descended to table-linen, bath-towels, dog-cloths and shirt-collars, until there seems to be no spot left on which to apply them, unless it be to tattoo them on the forehead or put them on the door-plate. In the latter case we venture to suggest that a small boy at hand with a *libretto* will be a needful accessory, for none but the individual to be guessed at could translate the hieroglyphic snarl which looks like the tangle of angle-worms known as an eel-bob.

Who can tell whether *S. J. M.* curleued together stands for Susan Jane Muggins, Melville J. Snooks, Julia Melissa Spriggins, or Moses S. Jinks?

Shakespeare asks, “What’s in a name?” With what a deal more reason he might ask, What’s in a monogram?

A. STEELE PENN.

DR. W. B. CARPENTER, F. R. S.

WILLIAM BENJAMIN CARPENTER was born in Exeter, October 29, 1813. His father, Dr. Lant Carpenter, was a dissenting minister, favorably known as a writer on theological subjects. More widely known, however, as a zealous worker in the cause of juvenile reformation, is his sister, Miss Mary Carpenter. Only his earliest childhood was spent in Exeter, for in 1817 the family removed to Bristol. Like several distinguished Englishmen of the present day, among whom are to be named Mr. John Stuart Mill and Mr. Herbert Spencer, Dr. Carpenter’s subsequent achievements cannot be traced

to the training received at any of the public schools; since his early instruction was carried on entirely under his father’s roof. Besides the ordinary branches of an English lad’s education, he devoted himself to physics and chemistry, for which he already showed a special taste and aptitude. His wish was to become a civil engineer, but, no suitable opening presenting itself at this time in that profession, he yielded to the desire of his family that he should study medicine. Mr. J. B. Estlin, a general practitioner of high standing in Bristol, and brother-in-law of Dr. Pritchard, the ethnologist, having offered to take him as a pupil and apprentice to the medical profession, an engagement to this effect was entered into. This was in 1828. Besides receiving private instructions, Mr. Carpenter attended lectures at the Bristol Medical School, and at the Bristol Philosophical and Literary Institution, and had hospital practice at the Bristol Infirmary. In the winter of 1832, the state of Mr. Estlin’s health rendering it desirable that he should make a voyage to the West Indies, Mr. Carpenter accompanied him to St. Vincent, where he stayed several months, and also visited the island of Granada.

On his return to Bristol, Mr. Carpenter resumed his medical studies and practice. In 1834 he went to London, where he prosecuted his studies at University College and Middlesex Hospital. It was at this time, while attending the lectures of Dr. Grant on Comparative Anatomy, that he imbibed that special love for the subject which has resulted in the production of those volumes on Physiology by which he is most generally known. Having passed his examination at the College of Surgeons and the Apothecaries’ Hall, he went in 1835 to Edinburgh, where he devoted himself to professional studies, under the able guidance of the distinguished men who at that time upheld the fame of Edinburgh University as one of the first medical schools in Europe. While here, he was elected the first of the four annual presidents of the Royal Medical Society.

After having spent two sessions in Edinburgh, Mr. Carpenter accepted the lectureship on Medical Jurisprudence in the Bristol Medical School, and at the same time commenced general practice in Bristol, intending to devote what spare time he might have to scientific pursuits. About this time he became a frequent contributor to various periodicals. Among the first of these contributions was a paper, “On the Voluntary and Instinctive Actions of Living Beings,” published in the *Edinburgh Medical and Surgical Journal*. In the *British and Foreign Medical Review*, of which he eventually became the editor, his papers are remarkable alike for number and for varied contents. The first, which appeared in the July number of 1837, was on “Vegetable Physiology.” This was succeeded in the following year by a critique on that portion of Whewell’s “History of the Inductive Sciences” which relates to physiology; and by an article on his favorite subject; “The Physiology of the Spinal Marrow,” where the writer discusses the doctrine of reflex action which Dr. Marshall Hall had recently propounded as new. These are tolerably good beginnings for a young man of twenty-four years.

An impulse and direction were given to Mr. Carpenter’s studies about this time, by his becoming possessed of a microscope, which a prize of thirty pounds, gained at Edinburgh University in 1837, for the best essay of that year, enabled him to purchase. He had already formed, and begun to execute, his design to write the now famous treatise entitled “General and Comparative Physiology,” the first edition of which appeared in 1838. The scientific reader will not need to be told the general character of this work; and any account of it, to be of use to the non-scientific reader, would transgress the limits of this biographical sketch. Dr. Carpenter confesses that the course of study he had to go through in bringing out the work was of immense service to him, though it was rather detrimental than otherwise to success in the practice of his profession.

Up to this time the subject of this memoir had not received the degree of M. D. According to one of the regulations of the University of Edinburgh, a three-years’ attendance was requisite for graduation; and when Mr. Carpenter accepted the post of lecturer at the Bristol Medical School, he had only completed his second year. Now, however, a change in the rules enabled him to graduate in 1839 by an additional residence of three months. His thesis on the occasion of taking his degree—“On the Physiological Inferences to be deduced from the Structure of the Nervous System of Invertebrated Animals”—gained for its author one of the gold medals annually distributed. The views advanced by the essayist, though meeting with some opposition for a time, were at once adopted by Professor Owen

and others, and have since passed into general acceptance among scientific men.

The scientific aspects of medicine having from the beginning possessed attractions superior to the strictly practical, Dr. Carpenter resolved to devote himself wholly to the study of physiology, the delivering of lectures, private tuition, and writing. On being appointed Fullerian Professor of Physiology in the Royal Institution, he resigned his post in the Bristol Medical School, and came in 1844 to London, where he has resided ever since. Hitherto he had been engaged chiefly in reducing to system the results of the investigations of others; as in his "Comparative Physiology," and "Human Physiol-

ogy," the latter of which first appeared during this year. But about this time he began to be known as an original investigator, in connection with his researches into the microscopic structure of the shells of *Echino-dermata*, *Mollusca*, *Crustacea*, etc. He was elected a Fellow of the Royal Society in 1844, and in the following year he obtained a lectureship at the London Hospital. A lectureship in geology was bestowed on him, by the trustees of the British Museum, in 1847, and in the same year he became one of the examiners of the London University. He also succeeded Dr. Forbes as editor of the *British and Foreign Medical Review*, to which he had been a constant contributor for years, and which was now amalgamated with the *Medico-Chirurgical Review*,

under the title *British and Foreign Medico-Chirurgical Review*. Besides editorial supervision, he continued to contribute articles to this periodical, on a wide range of subjects. In 1849 he was appointed Professor of Medical Jurisprudence at University College, a post which he held for ten years.

Some six or eight years had already elapsed from the time when Mr. Grove first promulgated his views on the now well-known doctrine of the "Correlation of Physical Forces." As indicated by the title of his treatise, Mr. Grove did not attempt to show the equivalence of the so-called "vital force" with the physical forces; but confined himself to proving the mutual convertibility of the *physical* forces—motion, heat, electricity, light, magnetism, etc. In a memoir communicated to the Royal Society in 1850; Dr. Carpenter carried the argu-

ment further; he attempted to bring the "vital force" also within the generalization, proving that it has its origin in solar light and heat, and not, as is commonly believed, in a power inherent in the germ.

The reader will form an idea of the success of Dr. Carpenter's two principal works from the fact that, as early as in 1851, a third edition of the "Comparative Physiology," and a fourth of the "Human Physiology," were called for. Very high authorities have expressed their appreciation of these works, and the debt which recent physiology owes to them. Among these authorities may be mentioned Sir Benjamin Brodie, who, in his Presidential Address at the

Annual Meeting of the Royal Society in 1861, said that Dr. Carpenter's works "have served, more perhaps than any others of their time, to spread the knowledge of those sciences, and promote their study among a large class of readers;" and that, "while they admirably fulfil their purpose as systematic expositions of the current state of knowledge on the subjects which they comprehend, they afford evidence throughout of much depth and extent of original thought on some of the great questions of physiology." The field where, perhaps, Dr. Carpenter has been most successful, is that border-land between the physical and the psychological, between matter and mind—the nervous system and its functions. He has also given us his

WILLIAM BENJAMIN CARPENTER.

thoughts on another topic of present interest, in an article on the "Varieties of the Human Race;" where he argues strongly on physiological and psychological grounds for the specific unity of mankind.

In 1852 Dr. Carpenter relinquished the editorship of the *Medico-Chirurgical Review*, on being appointed principal of University Hall—an institution for the reception of students at University College, similar to the halls at Oxford and Cambridge. By this change he was enabled to devote more time to scientific pursuits.

Of these pursuits a very important one was the study of the Australian and Philippine *Foraminifera*; the results of which were given in memoirs to the Royal Society, between 1856 and 1860. In these papers, says Sir B. Brodie in the address already referred to, Dr. Car-

penter "described some remarkable types which were previously quite unknown; he gave a detailed account of the very complex organization existing alike in the foregoing and in types previously well known by *external* configuration; he demonstrated the entire fallacy of the artificial system of classification hitherto in vogue, the primary divisions of which are based on the plan of growth; he laid the foundation of a natural system, based on those characters in the *internal* structure and conformation of the shell, which are most closely related to the physiological conditions of the animal; and, finally, by the comparison of very large numbers of individuals, he proved the existence of an extremely wide range of variation among the leading types of *Foraminifera*, often reassembling under a single species varying forms, which, for want of a sufficiently careful study, had not merely been separated into distinct species, but had been arranged under different genera, families, and even orders."

Another important series of subjects that engaged Dr. Carpenter's attention about this time, was the phenomena of mesmerism, hypnotism, electro-biology, etc. The result of his investigations will be found in the *Quarterly Review* for October, 1853. In this paper he endeavors to explain the phenomena by the *automatic action of the mind under the influence of suggestion, the will being in abeyance*. The same explanation he considers applicable to all the phenomena of spiritualism, with the exception of those which are referable either to trickery or self-deception.

A detailed account of Dr. Carpenter's contributions to the general body of scientific knowledge would be out of place here. Let it suffice to say that he continued to prosecute with success his researches into the microscopic structures of organisms. In 1856 he published "The Microscope and its Revelations." New editions of his two great works on physiology being again urgently demanded, there was entailed upon him immense labor in reorganizing them and bringing them up to the highest level of that rapidly-advancing science. So great, indeed, has been the toil required to keep the successive editions of the "Human Physiology" (which is at present in its eighth edition) abreast of the times, that the author has of late years been compelled to hand over to others this important duty, while he himself has devoted all his spare time and energy to original investigation in certain departments of zoology.

In this self-imposed task it would still have been impossible for Dr. Carpenter to accomplish any thing very noteworthy, had he continued to be distracted by the multifarious engagements which occupied so much of his time during the first ten or twelve years of his stay in London. But, fortunately for him and for science, he was appointed in 1856 registrar of the University of London. Though the duties of this office have considerably increased since he entered upon them, they still leave him many intervals of leisure for his favorite pursuits, while the salary attached to it is such as enables him to forego other engagements.

The Royal Medal awarded to Dr. Carpenter in 1861 by the Council of the Royal Society, was a well-earned recognition of the important services he has rendered to the cause of truth. And he continues to lay us under additional obligations. For to him, as to other devoted students of Nature, the conquest of one field is but the prelude to yet further conquests. Just now he is occupied with a subject of special interest; to wit, the investigations connected with the deep-sea dredging expeditions, carried on during the two previous autumns in one of her Britannic Majesty's ships, and conducted by him, Mr. J. Gwyn Jeffreys, and Professor Wyville Thompson. Though no final conclusions can as yet be arrived at, it seems to be clearly indicated that there is a vast sheet of the lowest type of animal life, which probably extends over the whole of the warmer regions of the sea. And there can be little doubt that, conducted by such experienced naturalists, these expeditions will result in correcting and enlarging our present knowledge regarding the distribution of life on the globe.

DAVID DUNCAN.

SPONTANEOUS COMBUSTION.

IN the summer of 1857, my vessel, the *Auckland*, a bark of about four hundred tons register, was engaged in trading-voyages on the coast of China. Having procured a cargo of bituminous coal at Tamsin, a port on the northwestern coast of the island of Formosa, we shaped our course for Shanghai, expecting the run to be made in

from six to eight days, as the distance in a direct line was only about six hundred miles.

As this coal contained an unusually large proportion of sulphur, which rendered it very easy of ignition, open lights were at all times forbidden in the hold, and every care was taken in battening down the hatches so that no water could penetrate them. For the first three days we had very stormy weather with a heavy sea, and, as the vessel was very deep, her decks were swept frequently by the waves, besides being flooded all the time, and it was not until the fifth day out that we were able to lay our direct course with a light, fair wind from the southward.

During the sixth night a strong smell of burning brimstone was noticed, but the most rigid search failed to discover any cause for it. On the following morning the odor was so intense in the cabin that we were all affected with dizziness, while the men in the fore-castle complained that they could neither eat nor sleep there. This led me to conclude that the cause of our uneasiness lay in the hold, either from the escape of gases or from fire, but probably the former, because no smoke was visible; but in either case it was not safe to remove the hatches. Fortunately our provisions were convenient, and, after a sufficient quantity had been brought on deck to last us into port, I had both cabin and fore-castle closed as tightly as possible, in order to exclude the air, covering all cracks and crevices with strips of canvas, and securing them again with battens. This state of things continued eight days, smoke issuing occasionally from crevices about the upper works, but these were stopped as soon as discovered, and we made all possible speed, not knowing at what minute the volcano under our feet might explode.

Finally, after a fifteen-days' passage, we arrived at Shanghai, and soon had man-of-war boats (among others from the United States steamship *San Jacinto*) with fire-engines alongside. Holes were cut in the deck, and streams of water poured down, but we did not know exactly where to apply them, and, as the decks were becoming uncomfortably hot, we slipped the cables, towed her into shoal water, and scuttled her. This of course extinguished the fire, and at low tide she was pumped out again and floated off. When the cargo was discharged, we found, abreast of the after-hatch, where the fire had been, it having burned down from the surface of the cargo to the planking of the vessel, and so charred that through to the copper sheathing, that with a common knife pieces of wood could be taken out, leaving the copper bare.

Immediately over this place, in the deck, there was a large ring-bolt, so loose that the water could drip through on to the coal, and it probably had done so constantly during the three days that our decks were submerged. This was supposed by the *savants* at Shanghai to have caused the combustion. I know not if this be so, but the facts are stated exactly as they occurred.

H. W. DODGE.

HERVÉ RIEL.

BY ROBERT BROWNING.

ON the sea and at the Hogue, sixteen hundred ninety-two,
Did the English fight the French—woe to France!
And, the thirty-first of May, helter-skelter through the blue,
Like a crowd of frightened porpoises a shoal of sharks pursue,
Came crowding ship on ship to St. Malo on the Rance,
With the English fleet in view.

"Twas the squadron that escaped, with the victor in full chase;
First and foremost of the drove, in his great ship, *Damfreville*;
Close on him fled, great and small,
Twenty-two good ships in all;
And they signalled to the place,
"Help the winners of a race!
Get us guidance, give us harbor, take us quick—or, quicker still;
Here's the English can and will!"

Then the pilots of the place put out brisk and leaped on board;
"Why, what hope or chance have ships like these to pass?"
laughed they:
"Rocks to starboard, rocks to port, all the passage scarred and
scored;
Shall the Formidable here, with her twelve-and-eighty guns,

Think to make the river-mouth by the single narrow way—
 Trust to enter where 'tis ticklish for a craft of twenty tons,
 And with flow at full beside?
 Now, 'tis slackest ebb of tide.
 Reach the mooring? Rather say,
 While rock stands or water runs,
 Not a ship will leave the bay!"

Then was called a council straight;
 Brief and bitter the debate:
 "Here's the English at our heels; would you have them take in tow
 All that's left us of the fleet, linked together stern and bow,
 For a prize to Plymouth Sound?
 Better run the ships aground!"
 Edded Damfreville his speech.
 "Not a minute more to wait!
 Let the captains all and each
 Shove ashore; then blow up, burn the vessels on the beach!
 France must undergo her fate."

"Give the word!" But no such word
 Was ever spoke or heard:
 For up stood, for out stepped, for in struck amid all these
 —A captain? A lieutenant? A mate—first, second, third?
 No such man of mark, and meet
 With his betters to compete!
 But a simple Breton sailor, pressed by Tourville for the fleet,
 A poor coasting-pilot he, Hervé Riel the Croisickese.

And, "What mockery or malice have we here?" cries Hervé Riel;
 "Are you mad, you Malouins? Are you cowards, fools, or rogues?
 Talk to me of rocks and shoals, me who took the soundings, tell!
 On my fingers every bank, every shallow, every swell,
 'Twixt the offing here and Grève, where the river disembogues?
 Are you bought by English gold? Is it love the lying's for?
 Morn and eve, night and day,
 Have I piloted your bay,
 Entered free and anchored fast at the foot of Solidor.
 Burn the fleet and ruin France? That were worse than fifty
 Hogues!
 Sirs, they know I speak the truth! Sirs, believe me there's a
 way!

Only let me lead the line,
 Have the biggest ship to steer,
 Get this Formidable clear,
 Make the others follow mine,
 And I lead them, most and least, by a passage I know well
 Right to Solidor past Grève,
 And there lay them safe and sound;
 And, if one ship misbehave,
 Keel so much as grate the ground,
 Why, I've nothing but my life—here's my head!" cries Hervé Riel.

Not a minute more to wait.
 "Steer us in, then, small and great!
 Take the helm, lead the line, save the squadron!" cried its chief.
 Captains, give the sailor place!
 He is admiral, in brief.
 Still the north-wind, by God's grace.
 See the noble fellow's face
 As the big ship, with a bound,
 Clears the entry like a hound,
 Keeps the passage as its inch of way were the wide sea's profound!
 See, safe through shoal and rock,
 How they follow in a flock!
 Not a ship that misbehaves, not a keel that grates the ground,
 Not a spar that comes to grief!
 The peril, see, is past;
 All are harbored to the last,
 And, just as Hervé Riel hollas, "Anchor!" sure as fate,
 Up the English come, too late!

So, the storm subsides to calm:
 They see the green trees wave
 On the heights o'erlooking Grève;

Hearts that bled are stanch'd with balm.

"Just our rapture to enhance,
 Let the English rake the bay,
 Gnash their teeth and glare askance,
 As they cannonade away!
 'Neath rampired Solidor pleasant riding on the Rance!"
 How hope succeeds despair on each captain's countenance!
 Out burst all with one accord,
 "This is paradise for hell!
 Let France, let France's king
 Thank the man that did the thing!"
 What a shout, and all one word—
 "Hervé Riel!"—
 As he stepped in front once more,
 Not a symptom of surprise
 In the frank blue Breton eyes—
 Just the same man as before.

Then said Damfreville: "My friend,
 I must speak out at the end,
 Though I find the speaking hard—
 Praise is deeper than the lips:
 You have saved the king his ships;
 You must name your own reward.
 'Faith, our sun was near eclipse!
 Demand whate'er you will,
 France remains your debtor still.
 Ask to heart's content, and have—or my name's not Damfreville!"

Then a beam of fun outbroke
 On the bearded mouth that spoke,
 As the honest heart laughed through
 Those frank eyes of Breton blue:
 "Since I needs must say my say,
 Since on board the duty's done,
 And from Malo Roads to Croisic Point—what is it but a run?—
 Since 'tis ask and have, I may—
 Since the others go ashore—
 Come! A good whole holiday!
 Leave to go and see my wife, whom I call the Belle Aurore!"
 That he asked, and that he got—nothing more.

Name and deed alike are lost:
 Not a pillar nor a post
 In his Croisic keeps alive the feat as it befell;
 Not a head in white and black
 On a single fishing-smack,
 In memory of the man but for whom had gone to wrack
 All that France saved from the fight whence England bore the
 bell.
 Go to Paris; rank on rank
 Search the heroes flung pell-mell
 On the Louvre, face and flank;
 You shall look long enough ere you come to Hervé Riel.
 So, for better and for worse,
 Hervé Riel, accept my verse!
 In my verse, Hervé Riel, do thou once more
 Save the squadron, honor France, love thy wife, the Belle Aurore!

SCENES IN FLORIDA.

OUR illustrations of "Picturesque America" in this number of the JOURNAL, from the graphic pencil of Mr. Fenn, tell their own story so well that little need be said about them.

"The light-house at St. John's Bar" is at the entrance of the great river of Florida, the stately and romantic St. John's, the River of May of the early Huguenot settlers. The region near the mouth is famous for battles and massacres, perpetrated by Spaniards and Frenchmen in the early history of the State of Florida. St. John's Bar is a formidable one, which has caused many shipwrecks, and can only be passed by an experienced pilot, and by vessels drawing not more than eight feet of water. The light-house is surrounded by sandy wastes, with here and there a picturesque palmetto, and some of the

PICTURESQUE AMERICA.—LIGHT-HOUSE, ST. JOHN'S BAR, FLORIDA.

PICTURESQUE AMERICA.-FLORIDA PINE-BARRENS.

strange cactus-like shrubbery of the Florida sea-shore. The aspect of the place is melancholy and desolate, and the breakers rolling perpetually on the snow-white sands of the shore, and on the higher portions of the bar, are well calculated to try the nerves of the novice whose vessel has to pass through them to gain the entrance to the river.

The "Pine Barrens" represent a section of country, very extensive in our Southern States, spreading from North Carolina to the extreme end of Florida. To a Northern eye they look barren indeed, and yet they bear heavy timber of the Southern pine species, and when cultivated yield good crops of vegetables and fruits. They have the great merit of healthfulness, and are generally free from the malaria which is the pest of the Southern seaboard. The pines are generally tall and shapely trees, growing wide enough apart to permit a horseman to ride freely among them. Now and then, however, as in the present picture, they assume singularly weird and fantastic shapes. In Florida they abound in game, and are still the resort of the bear, the deer, and the wild-turkey.

CHESTER.

CHESTER is one of the most interesting cities in all England, even to Englishmen, being the only walled city in the kingdom. The walls date back to the year 61, or thereabouts, when the place was occupied by the twentieth Roman legion as its headquarters. They still rest upon the foundations then laid by the Romans, whose work, in some spots, even now, makes a substantial part of the structure; while the four principal streets of the city are supposed to run just where the old Romans laid them out, nearly two thousand years ago, meeting in the centre of the city, where then stood the Roman *Prætorium*. Almost every excavation that is made bears witness to the occupation of the old conquerors; altars, statues, coins, tiles, pottery, baths, and other curious relics, coming constantly to the surface, as the advance of modern improvements disturbs the soil of the city.

Rear'd thus long ago, these ancient walls, extended in the year 75 by Marius, King of the Britons, rebuilt in 907 by the daughter of Alfred the Great, have stood many sieges, and looked down on many stirring scenes. Henry of Lancaster mustered his forces here in 1399, holding Richard II. as his prisoner in the castle. Loyal to Charles I., Chester was besieged in 1645 by the Parliamentary troops, and from the Phoenix Tower that still stands on the wall, the unhappy king witnessed the defeat of his troops; while, not far distant, still stands the house in which he lodged during his stay in the city.

Although the king's army was routed at the battle of Rowton Heath, the city of Chester held out for a long time, closely besieged by the Parliamentary forces. The sufferings of the inhabitants were very great, they being at last "constrained to feed on cats, dogs, horses, or whatever else, however loathsome, seemed likely to supply a little nutriment." The local historian of Chester, Randal Holme, has left us a queer account of matters at this time. Speaking of the mischief caused by the explosion of some grenades, December 10th, he says: "Two houses in the Watergate Street skip joint from joint, and create an earthquake; the main posts jostle each other, while the frightened casements fly for fear; in a word, the whole fabric is a perfect chaos, lively set forth in this metamorphosis; the grandmother, mother, and three children, are struck stark dead, and buried in the ruins of this humble edifice. . . . About midnight they shoot seven more; one of these lights in an old man's bedchamber, almost dead with age, and sends him some days sooner to the grave than perhaps was given him; the next day six more break in upon us, one of which persuades an old woman to bear the old man company to heaven, because the times were evil." At last, exhausted by hunger, after a brave defence of twenty weeks, Chester was surrendered, on most honorable terms, to the Parliamentary forces, on February 3, 1645-46. Many of the buildings were badly damaged during the siege, and the churches were shamefully desecrated, after the occupation, by the victorious army. Fonts were destroyed, tombs were violated, and the High Cross, where the four old Roman streets met, was demolished. The only old tombs spared in the churches are two still standing in St. Mary's Church; one, of Thomas Gamull, who lies with his wife at his side, in marble effigy on the top of the tomb, a statue of his son, praying at their feet, with smaller figures of their three daughters, bearing skulls in their hands, sculptured on the side of the tomb. The other

tomb is of Philip Oldfield, whose quaint effigy also surmounts the tomb.

The walls are now carefully preserved, and, on the top, furnish a delightful walk around the old city. Overlooking, on one side, the river Dee, at the place where King Edgar was rowed in a barge by eight tributary kings, and where you get a lovely prospect of the green banks of this beautiful river, crowned by the stately tower of the ancient Church of St. John, the walls, of two miles in extent, are, for the most part, closely hemmed in by houses on either side, for the modern city is more than twice the size of the older town originally enclosed within them. The ancient gateways have long ago decayed, and were, in the last century, replaced by others.

Within the walls the visitor is struck first by the peculiar architecture of the buildings, which are generally of massive timber-frames, with fronts most curiously carved, in the more ancient houses, some of which still exist, carefully preserved and restored, while the modern edifices imitate these ancient models, thus giving to the streets a most unique and picturesque appearance. The house of Bishop Lloyd, and that called the "God's Providence House," from the singular inscription on its front (commemorating the escape of the inmates from a visitation of the plague), "God's Providence is mine Inheritance," and an old palace of the Derby family, are the most noticeable and the best preserved of these buildings. The Lloyd House is most elaborately carved over the whole front; the wood, having become black with age and being now carefully preserved, presents a very beautiful appearance, utterly unlike any thing ever seen in America. It is quite impossible to describe the effect of these quaint old buildings in words; only the photographer and the engraver can convey an adequate idea of their peculiarities, although any one familiar with the streets of Boston will be at once reminded, in the general outline of many of them, of the old house which stood, only a few years ago, in Dock Square, near Faneuil Hall.

The "Rows" are entirely peculiar to the street architecture of Chester, and these, again, it is difficult to describe except pictorially. In all the principal streets you find what one might call a two-storied sidewalk, for, above the first story of the shops on the lower sidewalk, you come upon another sidewalk, piazza-like, on the inner side of which is another row of shops, whose customers walk above the heads of the purchasers in those below. The upper shops are much sought for, and compare well in the excellence and variety of their contents with those of the most favored cities. Here, entirely sheltered from sun, wind, and rain, one may walk through the principal streets of Chester, as it were, without going out of doors save, if need be, to cross the street. Flights of steps, at intervals, lead down to the sidewalk proper, which is narrower and by no means so attractive as the "Rows." These are well paved, and by night, well lighted. These curious galleries are supposed to be a relic of the architecture of the Romans, and to correspond with their *vestibules*, where clients awaited the coming of their patrons; while below, where the lower shops now are, were stored the various articles necessary for the house. Indeed, Tacitus speaks of the proneness of the Britons to adopt Roman customs (unlike the Britons of our day, who are slow to take to foreign ways), and of their fondness for the "porticus et balnea;" and the rows and the remains of Roman baths, of which several have been unearthed here, attest the faithfulness of the descriptions of the historian.

The massive tower of St. John's Church, which stands close by the bank of the Dee, is the most striking object as you look at the city on the south side. This is an ancient church, indeed, for its foundation dates back to the year 689, and some of the priory ruins in the rear of the church may be of that remote period. The church, as it now stands, was repaired and restored in 1581, and its round Norman arches, and the massive columns supporting them, will reward the attentive observation of the visitor.

The grandest and most satisfying building of the ancient city is the cathedral, which likewise dates its foundation far back in the ages, for the tradition runs that, during the Roman occupation, a temple of Apollo stood upon the spot where subsequently a monastery was dedicated to St. Peter and St. Paul, to which, in 875, the relics of St. Werburgh were removed, and a convent established dedicated to her. At the time of the dissolution of the monasteries, in the reign of Henry VIII., St. Werburgh's was converted into the Cathedral Church, which it has ever since remained, St. John's having, till that time, been the Cathedral of the Diocese.

This massive though not lofty edifice of the cathedral is blackened and worn by the storms of centuries, the soft sandstone of which it was built being ill fitted to resist the rains and winds that have beat upon it during these years, so that it is difficult to imagine a more venerable appearance in any building, not absolutely a ruin, than is presented by this. The stone crumbles into dust as you touch it with your finger's end, and the edges of every stone are worn and rounded by time and storm, so that it looks as rough and irregular almost as some of our New-England stone walls. The edifice threatened to become a ruin, indeed, a few years ago, and would have become one but for the timely restorations that have been commenced, and are now rapidly prosecuted, under the energetic supervision of the present dean, the Rev. J. S. Howson, whose works are so well known to bibliographical students both in England and America. An enthusiast in this pious work, the dean is pushing it as rapidly as the funds furnished him will permit, restoring not only the substantial groundwork upon which the permanence of the whole edifice depends, but reviving the original beauty and splendor of ornamentation, so essential to the due effect of Gothic architecture. The strong foundations have been secured, and now, within a few weeks, the noble tower has been completed, standing more beautiful even than when the building was new, in plan and detail such as it was intended by the old builders who first reared it. The best taste and the soundest judgment seem to guide those who are concerned in this restoration, of which very much has been already completed. The contrast between the portions of the building thus restored, and the ancient walls that remain, make the Cathedral of Chester, in its present state, a most interesting object of study to the architect and the antiquarian. A very general interest is felt in this work throughout England, and large subscriptions have been made to carry it on with considerable rapidity. It is to be hoped that the money will not cease to flow in, for the dean will not incur a farthing of debt to effect his object, and it is pleasant to remember that such enthusiastic zeal as his rarely fails to attain the end it has in view.

The choral service of the English Church is celebrated daily in the choir, and it is difficult to express the feelings with which one listens to this beautiful service, remembering that for centuries these white-robed priests and choristers have thus every day, morning and night, made these lofty arches resound with the chanted praises of the Almighty; that, though the cloud of fragrant incense ceased to curl up from the Romish altar, yet never for a day have these arches failed to echo with the deep tones of the organ and the intoned prayers and chanted psalms and the glorious anthems of the Church of the land. One cannot look upon the procession of the celebrants, or listen to the solemn service, without profound emotion.

In the beautiful Lady-Chapel, restored to its pristine splendor in the interior, George Marsh was doomed to martyrdom by the then Bishop of Chester, and, just without the north gate, he was burned at the stake. In Foxe's "Book of Martyrs" will be found the details of his trial and of his terrible death. "The people said he was a martyr, and died marvellously patient." One can scarcely realize that, in this beautiful chapel, he stands where this poor martyr heard his sentence, which the bishop "read unto the end, and afterward said unto him, 'Nor I will no more pray for thee than I will for a dog.'" Times have changed, indeed, and bishops too, in this good old town of Chester, since the year 1555, when these things were done there.

In strange contrast to these venerable remains of the olden time, and to the generally quaint and antiquated appearance of this old town, are the modern buildings for the uses of the county of Chester, for courts, jail, and other purposes, which have been added to the ancient buildings of the castle, which, of course, has a Caesar's Tower. You find one everywhere. These buildings are quite elegant, with classic colonnades and gateways, and, in the fine esplanade enclosed by them, the garrison goes through its daily military drill.

The new Town Hall, opened within the past year by the Prince of Wales, is a remarkably beautiful edifice, of Gothic architecture, the central tower of which is the most conspicuous object in a distant view of the city.

The fine bridges which cross the beautiful river Dee should not be forgotten in our sketch of Chester. The Grosvenor Bridge has a single massive stone arch with a span of two hundred feet, being of greater dimensions than any other in the world. It is a singularly beautiful feature in the view that meets the eye of the spectator from the castle. This was built in 1832 by the late Marquis of Westmin-

ster, whose benefactions to the city seem almost without number, and of princely munificence. Scarcely less noticeable, however, is the ancient seven-arched bridge, not far distant, and higher up the stream, built in the year 1280, on one end of which, from time immemorial, have stood the "Dee Mills," and to-day, as for nine hundred years back, the grain comes hither to be ground into flour for the city and its vicinage.

Eaton Hall, the magnificent residence of the Marquis of Westminster, lies in the centre of a noble park about three miles from the city. This splendid residence, said to be one of the finest specimens of modern pointed Gothic in the kingdom, was built in 1803. Magnificent as it is, having been for years an object of curiosity to visitors from every part of England, it does not suit the princely ideas of the present marquis, and he is now rebuilding the greater part of the edifice, and entirely remodelling the style of its architecture. Years will be occupied in this undertaking, so that Eaton Hall is closed to visitors for a long time to come.

Few places in England are so attractive and interesting to the American visitor as Chester, especially from the contrast which it presents in every respect to the bright glitter of our own new cities, and in its quiet and primeval repose to the whirl and bustle that characterize the cities of the New World. Within a half-hour's ride from Liverpool, where so many American travellers arrive, it is often among the first places that they visit. No intelligent traveller can fail to derive much pleasure and instruction from examining its antiquities, or can recall the days spent there without the greatest satisfaction.

HENRY WARE.

FRESH FISH.

NEW YORK has at least one market which is worthy of the greatness of the city. The new building of the Fishmongers' Association is thoroughly adapted to the purpose for which it was built. All New-Yorkers will remember the wretched old sheds in which the wholesale fresh-fish business of the city was until recently conducted. It was, if possible, a more dilapidated affair than Fulton or Washington Market.

This building rests upon piles, and is immediately north of the Fulton Ferry House. It is one hundred and ninety-three feet long by sixty wide, and thirty feet to the eaves; is all paid for, and all owned by those who do business beneath its roof. The market hours in winter are from 6 A. M. to 2 P. M.; in summer from 3 A. M. to 4 P. M. The building has many doors opening upon South Street on the west, and many opening upon the river on the east. By each river-side door is an iron ladder, reaching down to the water, and a block and tackle for hoisting fish singly or in boxes and baskets. A raft, called a "float," lies close to the piles on which the market is built; and outside of this float are, all the year round, eighty singular boxes for holding fish. These are called "cars," are twelve by eight, by two and a half feet deep, made of pine, and always floating—like some deep iron-clads—"level with the water." These eighty cars are used by fourteen firms—some having occasion, in busy times, in hot weather, for six or eight cars. In these boxes, which are open enough for the free passage of the water in and out, the fish can be kept alive for any desired length of time.

The question here naturally suggests itself, How are the fish brought alive from a distance? The answer is, in the "fish-wells" of vessels. Very few—including nautical people—know what is meant by a fish-well in a vessel. Most people suppose this is a simple tank, and would be horror-struck at the thought of sailing in any craft containing one, if they knew that these wells were literally what their name indicates—tanks firmly fastened in the vessels, with open lattice-work bottoms, for the free ingress and egress of sea water. These receptacles do not, however, endanger the fishing-smacks, as, their sides being as high as those of the boats, the water will never rise in them higher than it does on the outside of the boats. Those who know the use and nature of "centre-board trunks" in yachts, will understand this.

Outside of the "fish-cars" the sea-schooners and smacks are usually lying. At the time when the notes for this article were taken, the only fish-vessels in the dock were schooners, laden with "frozen her-ring" from the Banks of Newfoundland and the region round about. Here, is an immense branch of business, of which very few read.

ers have heard. About December 1st, many vessels assemble on those grounds. The fishermen, gathering in the herring by the shoal with seines, spread them on deck each night to freeze, or leave them there day and night until frozen, and then shovel them into the hold in bulk. In case they fear a thaw before reaching port, ice is mixed with the mass of frosty "train food." The unloading of these vessels is a curious spectacle. As you approach the one nearest the "string-piece" of the wharf, you will see, perhaps, half a dozen wretched-looking old women clustered around a tin weighing-scale pan, holding about a bushel. You observe them each receiving, in a coarse bag, "half a hundred," or so, of the rigid little fish. Inquiring if these women keep boarding-houses, you are informed that they are buying them to sell again. Passing over an empty vessel that is just taking in a return-load of flour for the "Provinces," and gazing down into the hold of the next schooner, you see that it looks very clean, nice, and icy; that one side is empty, and the other is piled up to the deck with the fish, none of which are much over a foot in length. A large iron scoop lies ready to shovel them up. To those who have never seen fresh herring, and have no knowledge of the dried sort, except that they have seen them in boxes at cheap groceries, the question will arise, What becomes of all these frozen herring? Soon after visiting these vessels, the writer had the following conversation with a skillful housewife on the subject. He asked, "Do you ever see any of these fresh herring?"

"Certainly. The hucksters bring them around continually."

"Do you buy them?"

"No; they are fair eating, but more than half bones. Friends of mine up the Hudson used to buy them fresh out of the river there, and were very fond of them; but, for people whose time is valuable, they cost more than they come to. The pile of backbones left after a dinner of such fish is wonderful to behold."

"So that is why we never eat fresh herring. But are they not sold very cheap?"

"Yes; they are not weighed, but sold quite cheap by the dozen."

But this is a digression from the description of the building. The first floor—except a strip about fifteen feet wide on the east side, which is occupied by the offices—is one great hall, in which all the fish that come to the city are continually represented by specimens lying in boxes and in permanent troughs. Each of the principal dealers has his office on the east side, with a larger private one overhead in the second story. All the space across the hall that corresponds to the width of his office is used by the dealer as a specimen and sales-room, the rows of iron pillars that support the second story serving as division-lines. A main gangway runs north and south, parallel with South Street, and along that side. A perpendicular iron ladder reaches from the floor at each compartment to a trap-door in the floor above, which is divided on the west side into storage-rooms for empty boxes and barrels. A light block and tackle serve to hoist these empty vessels to the store-rooms. Each sales-department has four weighing-machines: two in the rear, which are powerful scales, with weighing-pans attached, hung by chains from the ceiling; and two in front, one of which is like those in the rear, and the other (capable of weighing three hundred and sixty pounds) is hung by a block and tackle from the ceiling, so that the great six and eight feet halibut, etc., can be hoisted off the ground before weighing.

During all but four winter months, the stock of fish is received through the east side-doors, directly from the water, or from the schooners and smacks that bring it from all along-shore—Halifax and Norfolk being the extreme points of the sources of supply. Nearly all lines of steamers, and all railroads leading into the city, bring fish to this market in winter.

Very lively is the scene when this great mart is in full operation. In that fish-hall are to be found representatives of nearly all the families that inhabit "the water under the earth" in these latitudes. Here, in their season, are to be found side by side, at various times, the following varieties. Some, of course, are rarely seen in the market, and are mentioned as curiosities: The fall-herring, thimble-eyed mackerel, porgy, and scallop, from Rhode Island; the barracuda, blepheris, caranx, red drum, sea-eel, red gopher, harvest-fish, lampugus, mullet, prawn, seabastes, and green turtle, from the far South; the calico-bass, black-eared pond-fish, black-headed dace, carp, horned fish, carvina, cusk, lake moon-eye, jack-pickrel, large-scaled sucker, Western mud-fish, and white-tailed remora, from the great lakes; the bayonet, coal-fish, cockle, fiddler-crab, black drum, banded gar, needle-fish, and

ribbon-fish, from Long Island; the sea-perch, triple-tail black, silver-eel, Fundy and long-toothed flounder, frost-fish, sea-robin, laury, jelly-fish, sea-salmon, and toad-fish, from the Eastern States; the conger-eel, conch, bristly-hair-finned and monkey-faced dory, eel-pout, banded ephippus, Lafayette-fish, periwinkle, pilot, pompino, ray, red-mouth, sea-rover, sheep's-head, smooth skate, sole, and sea-wolf, from Jersey shore; the frog, goldfish, yellow perch, shrimp, sunfish, and terrapin, from the New-York rivers; the lobster, black shad, stickleback, and smelt, from Maine; the common herring and turbot, from Newfoundland; the haddock, hake, ling, fall-mackerel, pollack, and sword-fish, from Massachusetts; the halibut, from George's Banks and Nova Scotia; the lamprey-eel and common sucker, from Connecticut River; the striped bass, blue-fish, bonito, bram, bream, scalpin, butter-fish, dog-fish, dolphin, killifish, oyster, shad, shark, and winkle, from "all along-shore."

Many interesting and curious facts are obtainable in the library of the Fish Market, as every book of practical value concerning that commodity is to be found there. For instance, the origin of the New-York fishing-smacks is found to date back one hundred years. The *Gazette* of July 25, 1763, says: "Saturday last we launched the Amherst, fishing-smack, fully-rigged and fit for sea. There was a great concourse of people to see her off. She sails for the Banks this day."

The Legislature, to encourage the "fishery" on our coast, passed an act in 1773, and introduced it to the public:

CHAMBER OF COMMERCE, NEW YORK, April 6, 1773.

Whereas, The Legislature of the Province of New York have, by an act passed the 8th of March last, directed that the overplus of the duty of excise, collected in the said city and county, be annually paid for the first year next after the passing of the said act, to the treasurer of the corporation of the Chamber of Commerce, to be, by the said corporation, disposed of in such manner as they shall think most proper, for encouraging a fishery on the sea-coast, for the better supplying the markets in the city of New York—

In order, therefore, that the intention of the Legislature may be fully answered, and the inhabitants of this city receive the benefit of so laudable a donation, it is resolved and agreed that the following premiums, hereafter mentioned, be paid by the treasurer of the Chamber of Commerce to such persons who, upon application and due proof, made to the satisfaction of the Chamber, shall be entitled to the same, viz.:

To the owners and crew of any one boat or vessel, who shall supply this market with the greatest quantity of fish taken on the coast with trawl-nets (ray and skate excepted), from the 1st of May, 1773, to the 1st of May, 1774, the sum of.....	£40
To the same—with the same exceptions—the next greater quantity.....	£30
To the same—greatest quantity of live codfish, from November 1, 1773, to May 1, 1774.....	£30
To the same—and the same time—next greatest quantity of live codfish.....	£20
The greatest quantity of live sheep's-head, from May 1, 1773, to May 1, 1774.....	£20
The next greatest quantity of live sheep's-head.....	£15
The greatest quantity of live mackerel.....	£10

In 1783, Gaines's *Mercury* of May 26th said: "One day last week our market afforded no less than twenty-three different sorts of fresh fish." Twenty years after, fifty-six kinds of fish could be found in this market, and seventy in Philadelphia. It is only a few years since a regular business has been established, by which the many excellent varieties of the West have been brought East. It was thought that the Erie Canal would do much in this way, but it did not.

The estimates of amounts of fish brought to this market, that will be given presently, and which were carefully prepared by a Fish-mongers' committee for publication, will show some of the results of the wise legislation of our ancestors.

The following account of an interview with that committee contains a good deal of information of practical value, which could not be obtained from any other source. A series of questions was first asked concerning the kinds of fish that came from various quarters. After giving the facts about Newfoundland herring already mentioned, the interesting statement was made that from New Brunswick come most of the salmon found in this market in summer.

"What are the principal fish brought from Canada waters, including the great lakes?"

"Pike, pickerel and black bass. We have many ciscoes from Lake Ontario, and lake herring from Lakes Erie and Michigan."

"What come largely from Maine?"

"Nearly all smelt, bass, frost-fish or tomcods, and salmon."

"From Massachusetts?"

"It should be remembered that fish are often caught hundreds of miles from the point whence they are shipped to New York. For instance, halibut, which are caught at Nova Scotia and George's Banks, are shipped to us from Boston and Gloucester."

"Yes, I have seen the word 'Gloucester' on the sterns of many smacks that lay in front of the fish-market, as I crossed the Fulton ferry."

"Cod, wherever caught, are landed mostly on Lynn Beach. Haddock are caught all along Massachusetts and western Maine shores; but mostly from twenty to sixty miles from Boston."

"What comes from Newport?"

"No great variety from there. Some cod, and haddock, and flounders; but mostly blue-bass."

"What from New York harbor?"

"Scarcely any thing but weak-fish."

"How about Jersey and Delaware shore?"

"Vessels fish along these clear down to Cape Henlopen. They bring in sea-bass, porgies, and blue-fish."

"Do you get any thing from Philadelphia?"

"Some bass and perch are caught in Indian River, and reshipped to us from Philadelphia."

"From Baltimore?"

"Bass, perch, and pickerel; and of course shad in spring."

"Do you receive any considerable quantity from far-Southern waters?"

"Bass and pickerel from the Chesapeake. Had shad from Savannah and Charleston in the middle of January, but no great quantity. The first hundred-barrel lot came from Roanoke Island, North Carolina."

"Do you receive many sea-fish by railroad express?"

"Baltimore fish come altogether by rail and express."

"Are your sales largest in winter or in summer?"

"There is more fish sold here in the four months, March, April, May, and June, than in the other eight."

"What kinds do you ship? Where do you ship, and when and where?"

"All the principal kinds are shipped to all parts of the country according to demand. We sell to all points, from New Orleans to Canada—from New York to St. Paul. We ship most in winter and spring."

"What are your average losses in the different seasons?"

"We ship entirely at the risk of the owners. Their loss in summer is about two per cent.; in winter, almost nothing."

"Is there much variation in price?"

"Sometimes prices fluctuate violently for a few days. Heavy arrivals in summer will throw prices down: for instance, when a fleet of vessels come in that have been gathered outside by adverse winds. This makes some kinds very plenty for a few days, and the surplus has to go to the pedlars. We should be ruined without those fellows. But we must put the fish so that they can make something. One day we sell to the trade at a shilling a pound, and the next at four cents; and perhaps, before we shut up, we shall shovel the fish into the river. Blue-fish, cod, and porgies, are one day five dollars a hundred, and the next two dollars and fifty cents a barrel. The pedlars are our safety-valve. They are always running round to see who is worst 'stuck.' They take out fish and fruit as each is most depressed."

"What is the natural home of the bunkers, or menhaden, that we hear so much about?"

"From Florida to Maine."

"Are they good to eat?"

"Yes, quite good; but too plenty to be valued highly. They are caught in large quantities in nets laid for other fish at Hell Gate, and every Thursday a boat brings them to town, and they are sold to the very poor people."

"Now, finally, as to the quantities of various fish sold in this market; and, first, the frozen herring?"

"Between January 1st and May 1st about two million eight hundred thousand pounds are received, and about one hundred thousand pounds of 'green' herring through the summer from the Connecticut River; of halibut, one million pounds; of smelt, three hundred thousand pounds; of codfish, two million two hundred thousand pounds; of haddock, five million pounds; of shad and mackerel, two hundred thousand dollars' worth, at an average of twenty cents. The best

shad come from the Connecticut River. Of white-fish, probably three hundred thousand pounds."

It may be said, in conclusion, that this great fish-market, when in full operation, is one of the curiosities of the city. The wonderful variety of fish, their singular contrasts, the great bulk of some, the rush of active operators, buying, selling, packing and unpacking, weighing, sorting, cutting, and delivering, present a scene of great interest. The way in which a skilful dealer manipulates a monster halibut is curious enough. With one slash of a great butcher-knife he cuts off the tail. Then dashing an exaggerated "cotton-hook" into the head, he removes that comparatively-valueless portion with two more blows. Fastening the hook again in the neck, he slits the throat longitudinally, and, with another jerk of his knife, brings out a great lump of ice that has been deposited there when the animal was caught off George's Banks. It is then ready for delivery to the retailer. This is but one specimen of the interesting performances that can be witnessed in that market. Citizens and visitors from abroad will do well to add it to their list of New-York sights.

SAMUEL LEAVITT.

IMMORTALITY.

I.

THE grass withereth, the flower fadeth;
But from their ripened cells,
Day after day, their life I garner,
As the soft south-wind knells—
Their requiem.

II.

Such little seeds, closed in gold casing,
Yet I will plant, with care,
In fallow ground their closed-up coffins,
Till grass and flower fair
Shall live again.

III.

Thus God, methinks, garners man's memories
Among His ripened store.
If globed in gold, their deeds lie hidden,
When autumn winds sing o'er—
Their requiems.

IV.

For all our memories, when they're clasped in
Life's book of golden deeds,
Seems to God's eye, who sees their harvest
Millions of ripened seeds
For paradise.

V.

And some are gray, some brown, some golden,
As they in hearts have borne
Sweet blossoms, whose immortal fragrance
Hovers round those that mourn,
Like atmospheres.

VI.

The grass withereth, the flower fadeth,
Ay, and I know "'tis well,"
For they shall live again when spring-time's
Sweet birdlings' songs shall tell,
Above their knell.

CHARLOTTE CORDNER.

TABLE-TALK.

CANON KINGSLEY, by which title he is known in the Church of England, but who is probably better known to Americans as Charles Kingsley, the author of "Yeast," "Alton Locke," "Hypatia," and other admirable works, is not only a theologian but a learned naturalist, as he has shown by one or two publications of a scientific tendency. Two or three months ago he read to an assembly of clergymen, in the hall of Sion College, a very remarkable paper on the "Natural Theology of the Future," which he has since published in *Macmillan's Magazine* for March, with a preface, in which he pays a high compliment to Mivart's "Genesis of Species" as a work of great learning and ability, the production of an author whose name commanded all attention and respect. Canon Kingsley then goes on to argue that theology should keep pace with science as human thought changes and human science develops: "For, if in any age or country the God who seems to be revealed by Nature seems different from the God who is revealed by the then popular religion, then that God, and the religion which tells of that God, will gradually cease to be believed in. For the demands of reason must be and ought to be satisfied. And when a popular war arises between the reason of a generation and its theology, it behooves the ministers of religion to inquire, with all humility and godly fear, on which side lies the fault; whether the theology which they expound is all that it should be, or whether the reason of those who impugn it is all that it should be." He insists that the religious temper of England for the last two or three generations has been unfavorable to a sound and scientific development of natural theology. If we need proof of this, we have only, he says, to look at the hymns—many of them very pure, pious, and beautiful—which are used at this day in churches and chapels by persons of every shade of opinion. How often is the tone in which they speak of the natural world one of dissatisfaction, distrust, almost contempt! "Disease, decay, and death around I see," is their key-note, rather than "O all ye works of the Lord, bless Him, praise Him, and magnify Him together." There lingers about them a savor of the old monastic theory that this earth is the devil's planet, fallen, accursed, goblin-haunted, needing to be exorcised at every turn before it is useful or even safe for man. He presses, therefore, on his clerical brethren this point: "It is time that we should make up our minds what tone Scripture *does* take toward Nature, natural science, natural theology." With regard to Darwinism and the current theories of evolution and development, Canon Kingsley has no fear that they will be found irreconcilable with Christian faith. He says the Scripture only tells us that God created, and not how He created or creates. He concludes in these words, which are surely well worthy of the closest consideration: "Let us look with calmness, and even with hope and goodwill, on these new theories; for, correct or incorrect, they surely mark a tendency toward a more, not a less, scriptural view of Nature.

Are they not attempts, whether successful or unsuccessful, to escape from that shallow mechanical notion of the universe and its Creator which was too much in vogue in the eighteenth century among divines as well as philosophers; the theory which Goethe (to do him justice), and after him Mr. Thomas Carlyle, have treated with such noble scorn; the theory, I mean, that God has wound up the universe like a clock, and left it to tick by itself till it runs down, never troubling Himself with it, save possibly—for even that was only half-believed—by rare miraculous interferences with the laws which He himself had made? Out of that chilling dream of a dead universe ungoverned by an absent God, the human mind, in Germany especially, tried during the early part of this century to escape by strange roads; roads by which there was no escape, because they were not laid down on the firm ground of scientific facts. Then, in despair, men turned to the facts which they had neglected, and said, 'We are weary of philosophy; we will study you, and you alone. As for God, who can find Him?' And they have worked at the facts like gallant and honest men; and their work, like all good work, has produced, in the last fifty years, results more enormous than they even dreamed. But what are they finding, more and more, below their facts, below all phenomena which the scalpel and the microscope can show? A something nameless, invisible, imponderable, yet seemingly omnipresent and omnipotent, retreating before them deeper and deeper, the deeper they delve: namely, the life which shapes and makes—that which the old-school men called 'forma formativa,' which they call vital force and what not—metaphors all, or rather counters to mark an unknown quantity, as if they should call it *x* or *y*. One says, 'It is all vibrations;' but his reason, unsatisfied, asks, 'And what makes the vibrations vibrate?' Another: 'It is all physiological units;' but his reason asks, 'What is the "physis," the nature, and "innate tendency" of the units?' A third: 'It may be all caused by infinitely numerous "gemmules;"' but his reason asks him, 'What puts infinite order into these gemmules, instead of infinite anarchy?' I mention these theories not to laugh at them. No man has a deeper respect for those who have put them forth. Nor would it interfere with my theological creed if any or all of them were proven to be true to-morrow. I mention them only to show that beneath all these theories—true or false—still lies the unknown *z*. Scientific men are becoming more and more aware of it; I had almost said, ready to worship it. More and more the noblest-minded of them are engrossed by the mystery of that unknown and truly miraculous element in Nature, which is always escaping them, though they cannot escape it. How should they escape it? Was it not written of old—'Whither shall I go from Thy presence, or whither shall I flee from Thy spirit?' Ah, that we clergy would summon up courage to tell them that! Courage to tell them—that need not hamper for a moment the freedom of their investigations, what will add to them a sanction, I may say a sanctity—that the unknown *z* which lies below all phenomena, which is forever at work

on all phenomena, on the whole and on every part of the whole, down to the coloring of every leaf and the curdling of every cell of protoplasm, is none other than that which the old Hebrews called—(by a metaphor, no doubt—for how can man speak of the unseen save in metaphors drawn from the seen?—but by the only metaphor adequate to express the perpetual and omnipresent miracle)—the Breath of God; the Spirit who is the Lord and Giver of Life."

— We doubt if the disposition for pretension and show among our people, and perhaps peculiar to the age, exhibits itself more offensively than in the management of the small hotels throughout the country. These hotels are not bad because of the indifference of the proprietors, but because there is no perception of the wise limitations that should govern their administration. Because the great hotels of the big cities set elaborate dinners, every inn-keeper in the villages imagines that he, too, must lay out his courses, adjust his *entrées*, and flourish his desserts. When the tired traveller asks for a single dish that shall be of good quality, well cooked, cleanly, and neatly served, he is exasperated by a horrible procession of intolerable fragments, not one of which is wholesome, toothsome, or even endurable. First comes, in the dingy dining-room of these would-be-fine places, a washy soup, then a greasy bit of fish, then a cold and flavorless morsel of ill-cooked beef, flanked with a promising array of vegetables, but every dish of which is as a whitened sepulchre, all abomination within; then a cheerless fraction of a chicken, then puddings and pies, that come and go untouched, for the evil they bear is too unmistakably stamped upon them. Now, if with far less parade, the traveller could have just one dish placed before him, and that well selected and carefully prepared, how much useless labor would be saved the caterer, and how much comfort would reward the hungry sojourner! Instead of a dozen wretched failures, one success! For instance, a broiled chicken, tender, hot, delicate; or a chop, juicy, rare, fresh from the gridiron to well-warmed plate, with all the savory sweetness retained; or a tender-loin of steak, flavored with a mushroom, and brought with scrupulous expedition from the fire to your dish—but there is no need to enumerate when every one can think for himself how many delightful yet simple services of the kind might be offered to travellers if tavern-keepers did not want to be hotel-keepers and the beauty of doing a single thing well were not among the lost arts. A dinner of many courses is a thing requiring, in addition to great care and nice taste, a something called art. It is a difficult thing to do when the caterer has every advantage of resources and skill; but, attempted in the inns of fourth or fifth rate towns, becomes one of the greatest absurdities and shams of the day. These elaborate, semi-state dinners, moreover, involve and demand social elements. The intervals between the courses are for conversation. They are not designed by their very nature for the isolated traveller; even if more successfully served than we ever found them to be, they

would still be unsuitable for the greater number of the partakers. Every traveller will bear us witness that his great needs are: first, a clean bed; next, a wholesome meal. He detests the fuss and folly of would-be-fine dinners, and longs for the return of those good old days when an inn was sure to give him a bright fire on the hearth, a clean cloth for the table, and a steaming, savory, generous dish for the stimulated palate.

— Sir Walter Scott was born at Edinburgh, August 15, 1771, and the centennial anniversary of his birth, therefore, is near at hand. It is proposed to celebrate it throughout the civilized world, as the centennial birthdays of Burns and of Schiller were celebrated, more or less extensively, twelve years ago. The occasion is certainly one fit to be commemorated. Scott was not only one of the greatest, but one of the purest of authors. There is no stain or blot upon his name or fame. His poems and his novels are sources of unmixed delight to millions, and contain nothing to soil or to harm the most innocent or most sensitive mind. As a poet, though he is just now underrated, or rather neglected, we are confident that the final verdict of criticism will place him among the great masters of song—with Homer, Dante, Shakespeare, and Milton. The fashion of the day runs after the subtler and seemingly more *poetical* poets—after those who affect to be profound and philosophical—and leaves the manly, vigorous, and picturesque verse of Scott, with its fiery narrative, its dramatic force, its graphic descriptions, and its multitudinous touches of natural beauty, to the hearty enjoyment of school-boys. But the time assuredly will come when the great merits of the mighty minstrel will be recognized and enjoyed by those who can fully appreciate them, and who have the sense to see that poetry can be of the highest order, even though it be not dull nor difficult to understand, and even though it present itself to us in the form of a charming story related with a rapid fluency and a careless grace which seem so easy and so natural that we are almost inclined to despise what apparently cost so little labor, though the really critical eye can see everywhere abundant evidences of the exertion of the highest genius and most consummate literary skill. The neglect into which the poems of Scott have fallen has been shared, to some extent, by his novels, which, it is said, are pronounced rather “slow” by the young ladies who have gaudied their minds with the rottenness of “*Quida*,” and the other “fast” novelists of the day. They are deficient, doubtless, in some of the elements of interest of the sensational school, which ransacks earth and heaven for its materials, and they are also lacking in that minute and morbid analysis of character which distinguishes the psychological novels now so popular; but in the greater and broader qualities of romance, in the portraiture of types of character, in depicting gentlemen and ladies, soldiers and statesmen, villains, vagabonds, and humorists, in scenes of dramatic power and historic interest, Scott is yet without a rival, notwithstanding the vast amount of talent expended among all civilized nations, during the last half-century, in the vain effort to imitate his novels.

— A Virginia lady writes to us protesting against the declaration we quoted lately from Gail Hamilton, that women could find work enough to do if they would only seek it where it is to be found, in the kitchen, and cease trying to be teachers or government clerks, for which positions there are a hundred applicants to one vacancy. Our correspondent says: “Why should woman toil, toil forever? Nothing is said if men turn their ploughs into easy-chairs, and exchange the anvil and the forge, the pick and the axe, for the leisure and dignity of office. And yet—and yet it was to man, only, that God said: ‘In the sweat of thy face shalt thou eat thy bread, till thou return unto the ground.’ It is not human nature to love the labor of the hands; it came to mankind as a punishment for sin, and duty and necessity alone enforce its performance. As woman is very human, it is not, therefore, her nature to accept it as a path of pleasantness. Then why should there be such an outcry if she, too, seeks the easy places with good pay? God forbid that I should be thought an advocate of those noisy women who go about seeking to overturn the eternal decrees given by Divine inspiration for our guidance, one jot or one tittle of which I have no desire should be altered! But I only plead that where there is a place that detracts nothing from the pure womanliness of her who fills it, do not say her nay; do not condemn it as something dreadful that she should turn from her household idols—kettles, wash-tubs, and irons, and stretch out her toil-grimed hands for the purple and fine linen of government offices and school-teaching! That there may not be enough of these places for all the applicants, is no argument. Do men know nothing of the bitterness of such disappointment; and does anybody recommend that they all shall cease trying, because some are turned empty away?”

— The Chicago *Evening Journal* says that APPLETONS’ JOURNAL “fulfils in a remarkable degree the conditions of a model popular magazine. It is issued weekly, in magazine-journal form, thus coming often enough to be depended on for constant reading, and yet in a shape for permanent use. The aim of the publication is popular; but it is in no sense low. On the contrary, it is distinctly and conscientiously high. Probably the publishers could quadruple their profits by filling the pages of their journal with sensational matter, which can be had at small cost—can be had for the stealing, in fact, and of which two or three times as much could be sold as is sold of the solid instruction and wholesome entertainment now offered by the publication. But no temptation to reduce the level of the JOURNAL has ever influenced its conductors. They wisely fixed their plans in the beginning to afford a weekly miscellany of literature, science, and art, always interesting, but never at the sacrifice of good influence—always instructive, but never dull; and we think the severest critic must confess, if he will look through the pages of a half-yearly volume, that more complete success, either in artistic illustrations, profusely bestowed, or in varied literary matter—scientific, biographical, etc.—could not be asked. A

work like this is a product of pencil, pen, and printing-press, which was never before offered in the poor man’s market, as well as sent to the rich man’s parlor, as this, by its low price, is. At ten cents a week, it is an instrument of civilization, an organ of popular progress, which no wealth could have commanded a hundred years ago.”

— T. C. Barry, of Kossee, Texas, has sent to us, with a letter, a silver quarter of a dollar, on one side of which is the following inscription, evidently cut with a penknife:

“SERGEANT L. CRONE,
Co. G, 1st Vet. Cav. N. Y. S. V.”

The coin has a hole in it, and was evidently intended to be suspended by a string to the sergeant’s body or clothing. Mr. Barry, who was himself a Confederate soldier, and doubtless a brave man, as he is evidently a kind one, writes as follows: “The enclosed coin was passed into my store, a few days since, and, on noting the inscription on it, I thought some of the sergeant’s family might like to have it. I believe there is some society in your State that keeps record of your veterans, and sends such little mementos to friends. Your JOURNAL is the only paper I ever see from the North, and I consequently forward this to you, thinking it may afford you a pleasure to make some one happy by receiving it.” If any of our readers know any thing of Sergeant Cronk, we hope they will communicate to us their information.

Literary Notes.

THE English journals are evidently rather shy of Mr. Darwin’s last work. They approach it cautiously, and handle it gingerly, as if they did not well know what to make of it. They all, however, admit its merit as a contribution to natural history. The *Athenæum* remarks that “it is replete with facts and arguments, and that it is a natural-history maze. Its literary merit lies in the marshalling and disposing in due order of a multitude of observations gathered from numerous inquirers, and from very numerous publications. Whoever will peruse these volumes apart from their ultimate aim, and totally disregard the author’s hypotheses, will be highly pleased with them, and will readily acknowledge the patience and industry of the compiler of so many scattered facts in natural history. We have, in this spirit, already twice read many pages, and hope twice to read many more. In this spirit, too, we are not concerned about vagueness or irrelativeness; we accept the volumes as a naturalist’s miscellany, and are grateful for the entertainment they have afforded us.”

The *Spectator* says that “even to readers who are not naturalists, Mr. Darwin’s works are full of fascination and instruction. No writer of the day arranges his facts so lucidly, with so unquestionable a sincerity, and so undisguised a candor when he has difficulties to confess. Though Mr. Darwin has shocked the deepest prejudices and prepossessions, he seems to live in a region far above the temper of controversy, and to aim at nothing but the nearest approach to scientific hypothesis that it is in his power to make. There is not a word of harsh criticism in his volumes, and, as far as a reader can judge, not a trace of disposition to disguise the objections to the views which he is disposed to take. It is hard to conceive of a

scientific style at once so dispassionate and so full of intellectual vitality. There is nothing of the dreary prolixity of a mind too full to keep its material subordinate to the question under discussion, and yet nothing of the dogmatic vehemence of one that cannot bear to doubt the truth of its own conclusions. Every chapter advances the theory of the book, and yet every chapter deepens the confidence of the reader in his author's candor and grasp."

In its second notice of the work, the *Saturday Review*, speaking of the author's theory of sexual selection, pays a similar tribute to the value of the work in relation to natural history. It says: "Through a series of chapters, ranging over the entire field of natural history, Mr. Darwin traces what he regards as the evidence of this exertion of choice or taste in the pairing or crossing of animals. The particulars of their courtship furnish an amount of reading in itself most curious and romantic, even apart from the special hypothesis it is designed to support. The loves of the animals have never before been shown so instinct with meaning and even with poetry. Throughout the most widely-distinct classes of the animal kingdom, mammals, birds, reptiles, fishes, insects, and even crustaceans, obey the same general rules. The males are almost always the wooers, and they alone are armed with special weapons for fighting with their rivals. They are generally stronger and larger than the females, and are endowed with the requisite qualities of courage and pugnacity. If not exclusively, they are at least in a much higher degree than the females provided with musical organs or odoriferous glands, with brilliant plumes or diversified appendages, which, acting upon the sense of beauty inherent in all animals, attract and fascinate the female. Often the male is gifted with special sense-organs for discovering the female, with locomotive organs for reaching her, and with prehensile organs for holding her. These various special structures are often developed in the male during part only of the year—namely, the breeding-season. They have in many cases been transferred in a greater or less degree to the females, in whom, however, they appear but as mere rudiments. On the other hand, in certain anomalous cases there is seen an almost complete transposition of the character proper to both sexes, and rudiments of the female structure are found in the male, as in the case of the mammary glands in man. The laws of inheritance, which Mr. Darwin acknowledges to be obscure and little understood, must ultimately determine how far characteristics gained through the prolonged action of sexual preference by either sex shall be transmitted to the same sex, or to both sexes, as well as the age at which they shall be developed. But variations thus induced and accumulated through many generations may reach a degree of difference so strongly pronounced as to rank almost as distinct species or even genera. Of all the causes which have led to the differences in external form and character between the races of men, and to a certain extent between man and the lower animals, Mr. Darwin holds the belief that the most efficient by far has thus been sexual selection."

Sir John Lubbock's work on the "Origin of Civilization" has reached a second edition in England, in spite of a good deal of adverse criticism, based chiefly on theological grounds. The conclusions maintained by Sir John Lubbock in this work are, in his own words:

"That existing savages are not the descendants of civilized ancestors.

"That the primitive condition of man was one of utter barbarism.

"That, from this condition, several races have independently raised themselves."

On the other hand, we have the opinion of the late Archbishop Whately, that "we have no reason to suppose that any community ever did or ever can emerge, unassisted by external helps, from a state of utter barbarism into any thing that can be called civilization;" and that of the Duke of Argyll, who holds that the primitive condition of man was one of civilization; that "there is no necessary connection between a state of mere childhood in respect to knowledge and a state of utter barbarism," and that man "even in his most civilized condition, is capable of degradation; that his knowledge may decay, and that his religion may be lost."

That the general propositions laid down by Archbishop Whately and the Duke of Argyll contain a certain limited amount of substantial truth, will probably be admitted by the staunchest adherents of the opposite theory. That "external helps" of some kind or other have played a most important part in the case of all civilizations the history of which is accessible, is as little open to question as the fact that under certain conditions civilization among certain races may be arrested or may even retrograde. At the very threshold, however, of any discussion in terms less general, we are met by the question "What is civilization?" The baffling complexity, indeed, of the idea conveyed in the word "civilization" is the fountain-head of most of the confusion which exists among writers on the subject. That development is the vital principle, so to speak, of civilization is universally admitted, but there would probably be a very general disagreement of opinion as to the particular kinds and directions of development which constitute the essential elements of civilization. As generally understood, civilization appears to involve a development more or less advanced of commerce and the means of communication, of natural advantages, products, and wealth, of navigation and warfare, of the arts, mechanical and ornamental; of science, theoretical and practical; of legislation and the administration of the law; of customs and language; of morals and religion; of all the faculties of the individual and the race. It includes also a consideration of the diffusion of personal liberty, and of the proportion of those who participate in the general welfare and possess the necessary appliances both for physical comfort and intellectual culture. This, of course, is an inadequate definition of civilization; and it is further manifest, not only that development in many directions indicated is not absolutely necessary to civilization, but that no civilization on record has been equally developed in every direction. What is still wanting, is some standard by which to measure civilization in any particular case. Mr. Wallace, following Montaigne, appears to consider civilization compatible with a very low development in nearly every direction. Archbishop Whately would consider as civilized the Germans described by Tacitus. The Duke of Argyll goes further still, for he seems to consider that Adam and Eve, when expelled from paradise, were, nevertheless, distinctly-civilized beings. The diversity of opinion is, indeed, owing to the absence of a recognized standard, almost universal. Civilization is nearly always measured by the recorded achievements of men of genius. Yet, if this were the true test, no nation of modern Europe is so highly civilized as was Greece in the age of Pericles, and English civilization has been retrograding from the days of Elizabeth, nay, from those which gave us the "Canterbury Tales" and "Lincoln

Minster," if not from those of Anselm and the Norman Bastard.

Mr. St. George Mivart is an eminent English naturalist, who in his "Genesis of Species" has made the most effective reply to Darwin that has yet appeared. He treats Mr. Darwin with courtesy and candor, admits his great services to science, and the plausibility at first sight of his theory of natural selection which lies at the basis of the whole Darwinian system. He then proceeds, with evident mastery of the subject, to suggest objections and to produce facts in opposition to natural selection, which leave that theory hardly any thing to stand upon. He admits, it is true, that to a certain extent natural selection exists and acts; but he maintains that, in order that we may be able to account for the production of known kinds of animals and plants, it requires to be supplemented by the action of some other natural law or laws as yet undiscovered; also, that the consequences which have been drawn from evolution, whether exclusively Darwinian or not, to the prejudice of religion, by no means follow from it, and are in fact illegitimate.

Mr. Mivart declares that he was not disposed originally to dissent from the theory of natural selection; but he has found, after many years of careful examination and consideration, that it is wholly inadequate to account for the preservation and intensification of incessant specific and generic characters. That minute, fortuitous, and indefinite variations could have brought about such special forms and modifications, as Mr. Darwin maintains, seems to contradict reason and common-sense. In spite of all the resources of a fertile imagination, the Darwinian, pure and simple, is reduced to the assertion of a paradox as great as any he opposes. In the place of a mere assertion of our ignorance as to the way these phenomena have been produced, he brings forward as their explanation a cause which is demonstrably insufficient. The theory of natural selection is inconsistent with a vast multitude of facts in natural history, as well as with the first principles of the philosophy of the Divine government of the universe. Mr. Darwin has attempted to sustain it by a skilful collection of the facts which seem to serve his purpose; but the facts he has ignored disprove his theory, and with the explosion of that theory of natural selection his whole scheme falls to the ground.

It should be stated, however, that Mr. Mivart does not wholly deny that natural selection acts to some extent in the organic world. But its action is not supreme, as Mr. Darwin makes it, but is only secondary and subordinate to other forces. Mr. Mivart undertakes to prove, and we think does prove:

That natural selection is incompetent to account for the incipient stages of useful structures.

That it does not harmonize with the coexistence of closely-similar structures of diverse origin.

That there are grounds for thinking that specific differences may be developed suddenly instead of gradually.

That the opinion that species have definite though very different limits to their variability is still tenable.

That certain fossil transitional forms are absent, which might have been expected to be present.

That some facts of geographical distribution supplement other difficulties.

That the objection drawn from the physiological difference between species and races still exists unrefuted.

That there are many remarkable phenomena in organic forms upon which natural selection throws no light whatever, but the explanation of which, if they could be attained, might throw light upon specific origination.

Mr. Mivart, in short, maintains that the development of species has been brought about not wholly by natural selection, but by an internal power which has controlled and continues to control the universe—in other words, by Divine power.

A private letter from Greece gives some interesting notices of the reception in that country of the American minister's report on "Brigandage." "The *Age* of Athens contains a translation of the American minister's report on 'Brigandage in Greece,' accompanied by a long article full of grateful recognition of this first and only true history of the terrible massacre of last spring. This affair has been deliberately misrepresented by the English press, and the attempt made to implicate therein the Greek Government and people, whereas the brigands were Turks and Albanians who came over the border, and the only person proved guilty of connivance is a renegade Englishman. These and many other unpalatable truths were elicited during a prolonged legal investigation; yet such is the influence of dynastic prejudice that the only minister who has done honor to the subject is the representative of your Government. Hence the letter of thanks addressed him by King George. The journal above mentioned concludes its article in these words: 'Heart-felt gratitude is due by us to this noble citizen of the Great Republic, and this reward will be far more precious to a gentleman like Mr. Tuckerman than all the decorations and superficial compliments which political reasons dictate.'"

The aggregate sum paid to Alexander Dumas, Sr., by publishers and theatrical managers in the course of his long literary career, exceeds three million and a half francs. The amount, which will be paid to his heirs on his plays in France, is estimated at fifteen thousand francs a year. Dumas died largely in debt to his publishers. Michel Levy, of Paris, alone is said to lose by his death one hundred and fifty thousand francs.

Lacroix, the French publisher, has had the happy idea of producing a history of current events in France and other countries from the 1st of September, 1870, to the end of January in the present year, under the title of the "Journal des Deux Mondes;" the work is to consist of twelve parts, of which two have appeared.

The Leonard Scott Publishing Company have made arrangements to supply the place of *The North British Review*, which has recently been discontinued, by *The British Quarterly*, an able and popular review, the whole four numbers of which for the year 1871 will be furnished to subscribers without charge for the January number.

Publishers and authors are not always natural enemies. When Marian Evans had completed "Adam Bede"—she was little known then—she was glad to sell it outright to the Blackwoods for three hundred pounds. The novel had such a great success that the firm afterward gave her fifteen hundred pounds additional.

The Princess Dora d'Istria, is said to be the most learned woman in the world, reads and speaks fifteen languages, has written novels,

historical, philosophical, and philological works, is an honorary member of ten academies and learned societies, and is still said to be quite good-looking.

A young girl in Malaga, named Anita Perez, has published, in the *Andalusian Monthly Review*, two novels which the Spanish critics pronounce superior to any which have appeared in the literature of their country for many years past.

Robert Waldmüller, the German poet and novelist, is preparing for publication a volume entitled "The Correspondence of Charles Dickens with his Friends in Germany."

The exact title of Miss Alcott's forthcoming book is "Little Men: Life at Plumfield with 'Jo's' Boys."

The sale of Disraeli's "Lothair" has been quite large in Germany, both in the German translation and the English reprint.

Two new novels by Bjørnarne Bjørnson, the famous Norwegian author, are announced in the Christiania papers.

Ivan Turgueneff, the greatest of living Russian novelists, lies dangerously ill at his villa in Baden-Baden.

Professor Justus von Liebig is hard at work upon a cyclopædia of chemistry.

Francis Liszt is preparing a work on Turkish and Arabian music.

Sweden has eight literary magazines and reviews.

Foreign Items.

THE son of Louis Napoleon and Eugenie is said to strongly resemble his mother in all his traits, even in his language. He speaks French with a sort of foreign accent, and, whenever he gets excited, he uses a great many Spanish words. Despite his careful education, he is comparatively ignorant, and he cannot write a page without committing a number of orthographical blunders. He dislikes books, is inordinately fond of velocipede-riding, and drives his tutors to despair by the *nonchalance* with which he associates with boys of low descent, rather than with the sons of the aristocracy.

The social war between the Poles and Russians in Warsaw continues unabated. On the anniversaries of all days of mourning in the history of Russia, when the latter lost great battles or suffered other national calamities, the Poles of Warsaw are in the best of spirits, and fill the places of amusement to overflowing; on the other hand, on Russian days of rejoicing, the Poles shut themselves up in their houses, and the theatres are deserted. All efforts made by the Russian authorities to bring about a change in this state of affairs have hitherto proved fruitless.

Among the distinguished Parisians who had interviews with Count von Bismarck after the capitulation of Paris, was Edmond About. About was not a little taken aback when Bismarck told him that he had read all the articles in which About had called him a fiend and other hard names; but the chancellor reassured his visitor by telling him that he considered those articles very fine specimens of humorous journalism.

Young Cavaignac, the only son of General Cavaignac, who created quite a sensation sev-

eral years ago by refusing a prize at the hands of the prince imperial at a school examination in Paris, is now an officer in the regular army of France, and was quite severely wounded at the battle of Le Mans.

Wilhelm, the composer of the German national hymn, "The Watch on the Rhine," of which over six hundred thousand copies were sold in Germany since the breaking out of the war with France, died a few weeks ago of apoplexy.

Paris has lost in consequence of the war no fewer than eleven of her most able journalists. The latest victim is M. Henri de Pène, the well-known editor of the *Gazette des Etrangers*, and author of numerous charming *feuilleton* articles. He died of a wound received in front of the Hôtel de Ville.

The American residents of Vienna have sent a present, which cost seven hundred and eighty dollars, to the Prussian General von Werder, "in acknowledgment of the gallantry with which he protected the South of Germany from an invasion by Bourbaki's army."

There is a curious custom at the Russian court. Every Russian grand-duke and grand-duchess has the right to obtain a full pardon annually for three convicted felons, by speaking to the czar about it on a holiday. This custom has existed since the reign of Catherine I.

The reports about the insanity of ex-King George V. of Hanover are fully confirmed. The poor old man believes that he is dead, and it is said in Vienna that he refuses to sleep anywhere except in a coffin. Visitors have not been admitted to him for some time past.

The Mayor of Fontainebleau has requested Octave Feuillet to leave that place, there being reason to fear that the people would mob him on account of his intimate relations with the ex-Empress Eugenie.

Count von Beust's wife is so disgusted with the slights which she has met with at the hands of the Austrian court and aristocracy, that she has left Vienna, and, with her children, taken up her abode at Geneva.

At a fair held recently in Rome for the benefit of the wounded soldiers of Germany, Madame Urban Ratazzi, Napoleon's cousin, created a sensation by making more liberal purchases than anybody else.

The late Professor von Graefe, the greatest oculist of modern times, left to his heirs upward of four thousand presents, which he had received from grateful patients, some of which were very costly.

The municipal authorities of all cities in Prussia containing upward of twenty thousand inhabitants, have resolved to confer patents of honorary citizenship upon Prince von Bismarck and General von Moltke.

Bogumil Dawison, the celebrated German actor, who at one time was believed to be hopelessly insane, is said to be in a fair way to recover his full mental faculties at an early day.

The Archduchess Sophia of Austria, the mother of the Archduke Maximilian, still pays regular pensions to upward of twenty impoverished adherents and attendants of her ill-fated son.

Although the Queen of Portugal speaks the Portuguese language very imperfectly, she is

more popular than her royal husband, who, but for her, it is generally admitted, would have long ago been dethroned and driven out of the country.

Karl Blind, the German journalist and radical politician, is said to have amassed quite a fortune, during twenty years of exile in England, by corresponding for newspapers published in six different countries.

Erlangen, the old university city in Germany, is at present without a lawyer! Several years ago, there were four lawyers in the place; but three of them died last year, and the fourth was buried a few weeks ago.

The King of Bavaria occupies himself in his spare hours with devising new scenic effects for his theatre in Munich. He spends most of his private means in trying to carry his singular ideas on this subject into effect.

One of the large prizes offered by the philosophical faculty of the University of Leyden, is for "the best essay on the economical situation of the United States." The essay has to be written in Latin.

Pierre Bonaparte, who at present lives on his farm in the forest of Ardennes, in Belgium, desires to sell it in order to settle permanently on the island of Sardinia.

Queen Victoria has sent to Julius Rodenburg, the editor of the *Leipsic Salon*, the sum of one hundred pounds for his novel, "Oliver Cromwell."

Tibaldi, Orsini's accomplice in the attempt to assassinate the ex-Emperor Napoleon, is a candidate for one of the vacant seats in the French National Assembly.

M. de Sévigné, a lineal descendant of the celebrated Madame de Sévigné, is editor of a weekly newspaper at Bayonne, and, during the war, was lieutenant in the *Garde Mobile*.

The *Paris Opinion Nationale* contains the following significant "Advice to M. Jean-Jacques Offenbach:" "Don't come back!"

Seven princes and five dukes are members of the new German Parliament.

Two descendants of Mozart live in extreme poverty at Neustadt, in Austria.

Miscellany.

The Louvre.

THE Louvre is a building of countless traditions. Le Bon Roi Dagobert is said to have kept his horses and wolf-hounds here when the river-bank was all forest. Philip Augustus, about the year 1200, converted the hunting-box of the early French kings into a tower and moated fortress. A great tower in the centre was the keep; and Dukes of Brittany, Kings of Navarre, and Counts of Flanders, in various ages, acquired rheumatism in its dungeons. The old fortress was outside the walls of Paris, but Charles V. and VI. enclosed it within the *enceinte*, for greater security.

The original palace was only three hundred feet long. The names of some of the towers of the old Louvre—such as the *Tour de l'Orgueil*, the *Tour où se met le Roi quand on joute*, the *Tour de la Fauconnerie*—give one the notion of a dismal, loopholed, turreted kind of a Newgate, dark, strong, and repelling. Francis I. pulled down this old jackdaw's-nest, and reared an Italian palace, where he entertained

the Emperor Charles V. with reckless magnificence. Henry II., Catherine de Medicis, Charles IX., Henry III., Henry IV., and Louis XIII., all added to the Louvre. It was from a river-side window, in a part of the building pulled down by Louis XIII., that Charles IX. fired with insane eagerness on the Huguenot fugitives. Henry IV. began the long gallery to connect the Louvre with the Tuileries, and completed it so far as to be able to walk through it before his death. After his assassination by Ravaillac, the king's body was laid out in state in an apartment of the old Louvre. But in the reign of Louis XIV. the old tree put forth a noble shoot. At the suggestion of Colbert, the king resolved to complete the palace and the grand gallery parallel with the river. Leveau, the king's architect, had begun the principal façade; but it did not satisfy Colbert, who invited a competition of architects. The plan chosen was by Claude Perrault, who had been bred a physician. The south, or Seine, front was also by him.

The court of the Louvre is a square of three hundred and forty-eight feet. Voltaire says of the façade of the Louvre: "It is one of the most august monuments of architecture in the world, and there is not one of the palaces of Rome whose entrance is comparable to that of the Louvre, for which we are indebted to Perrault, whom Boileau attempted to turn into ridicule."

When Louis XIV. began Versailles, he grew tired of his other toy, the Louvre, part of which remained unroofed even down to the time of the great Napoleon, who completed the long picture-gallery connecting the Louvre with the Tuileries, and turned the palace into a vast national museum, full of the most glorious plunder military thief ever looted.

On the 17th of February, 1820, and four following days, the body of the murdered Duc de Berri, who had died begging that Louvel, his assassin, might be pardoned, lay in state in the south quadrangle of the Louvre.

One of the most historical rooms in the Louvre is the *Salle de Caryatides*, for here Henry IV.'s marriage was celebrated with Margaret de Valois, and here he lay in state after Ravaillac had struck the blow. In this chamber the stern Duc de Guise hung four of the most restless of the Leaguers; and here Molière built his theatre, and performed in some of his best comedies.

The Unlucky Lovers.

Fanny Foo-Foo was a Japanese girl,
A child of the great Tycoon;
She wore her head bald, and her clothes were made
Half-petticoat, half-pantaloon;
Her face was the color of lemon-peel,
And the shape of a tablespoon.

A handsome young chap was Johnny Hi-Hi,
And he wore paper-muslin clothes;
His glossy black hair on the top of his head
In the form of a shoe-brush rose;
His eyes slanted downward, as if some chap
Had savagely pulled his nose.

Fanny Foo-Foo loved Johnny Hi-Hi,
And when, in the usual style,
He popped, she blushed such a deep-orange tinge,
You'd have thought she'd too much bile,
If it hadn't been for her slant-eyed glance
And her charming wide-mouthed smile.

And oft in the bliss of their new-born love
Did these little pagans stray
All around in spots, enjoying themselves
In a strictly Japanese way;

She howling a song to a one-stringed lute,
On which she thought she could play.

Often he'd climb to a high ladder's top,
And quietly there repose
As he stood on his head and fanned himself,
While she balanced him on her nose;
Or else she would get in a pickle-tub
And be kicked around on his toes.

The course of true love, even in Japan,
Often runs extremely rough;
And the fierce Tycoon, when he heard of this,
Used Japanese oaths so tough
That his courtiers' hair would have stood on end,
If only they'd had enough.

So the Tycoon buckled on both his swords,
In his pistol placed a wad,
And went out to hunt the truant pair,
With his nerves braced by a tod.
He found them enjoying their guileless selves
On top of a lightning-rod.

Sternly he ordered the gentle Foo-Foo
To "come down out of that there!"
And he told Hi-Hi to go to a place—
I won't say precisely where;
Then he dragged off his child, whose spasms evinced
Unusually wild despair.

But the Tycoon, alas! was badly fooled,
Despite his paternal pains;
For John, with a toothpick, let all the blood
Out of his jugular veins;
While with a back-somersault on the floor
Foo-Foo battered out her brains.

They buried them both in the Tycoon's lot,
Right under a dogwood-tree,
Where they could list to the nightingale and
The buzz of the bumble-bee;
And where the mosquito's sorrowful chant
Maddens the restless flea.

And often at night, when the Tycoon's wife
Slumbered as sound as a post,
His almond-shaped eyeballs looked on a sight
That scared him to death almost;
'Twas a bald-headed spectre flitting about
With a paper-muslin ghost!

Dean Milman.

Dean Milman was a man in every way truly remarkable. He was a great social, a great literary influence. To be noticed by him was distinction. That he should be present at any social gathering, to render it the charm of his presence, his learning, his urbanity, and his humor, was in itself almost the highest distinction which any society could receive. The poet of the "Fall of Jerusalem," who was expected to be a second Milton, did not, indeed, advance from his first stand-point, but became the most thoughtful and enlightened of ecclesiastical historians. On the whole, he was perhaps rather a scholar than a divine. Apparently through the influence of Mr. Gladstone, he published, some years ago, a set of those English translations from the Greek with which he used to delight Oxford audiences; and he expressed an opinion that better epitaphs were to be found in the Greek anthology than in Christian church-yards. In any estimate of the history of modern opinion, the late dean will be found to have been a vast force. It would be hardly too much to say that Newmanism and Milmanism represent the two poles of ecclesiastical opinion in England. The author of the "Grammar of Assent," and the author of "Latin Christianity," are separated by a mighty diameter. Milman's style was saturated by Gibbon, whom he edited, and

like Gibbon, he helped to arch the interval between ancient and modern history. What Gibbon was to Milman, Milman became to a school of young "liberal" theological writers. They abolished the axiom that no man should wear by his master's words; for no Newman could be more thoroughly in the hands of his confessor than a Milmanite followed the traditions of Milman.

Mrs. Partington.

The original Mrs. Partington was a respectable old lady, living at Sidmouth, in Devonshire, England. Her cottage was on the beach, and the incident on which her fame is based is best told in a passage from the speech of Sydney Smith at Taunton, in the year 1831, on the Lords' rejection of the Reform Bill: "The attempt of the Lords to stop the progress of reform reminds me very forcibly of the great storm at Sidmouth, and of the conduct of the excellent Mrs. Partington on that occasion. In the winter of 1824 there set in a great flood upon that town—the tide rose to an incredible height, the waves rushed in upon the houses, and every thing was threatened with destruction. In the midst of this sublime and terrible storm, Dame Partington, who lived upon the beach, was seen at the door of her house, with mop and pattens, trundling her mop, squeezing out the sea-water, and vigorously pushing away the Atlantic Ocean. The Atlantic was roused. Mrs. Partington's spirit was up. But I need not tell you that the contest was unequal. The Atlantic Ocean beat Mrs. Partington. She was excellent at a slop or a puddle; but she should not have meddled with a tempest." This speech is reprinted in the collected edition of Sydney Smith's works, and as this is, we believe, the first time of Mrs. Partington's name being mentioned, the immortality she has earned must be set down as due to Sydney Smith.

Anagrams.

Astronomers,	No more stars.
Impatient,	Time in a pet.
Masquerade,	Queer as mad.

Varieties.

WHEN Alexander Dumas the younger first achieved literary fame by "The Lady of the Camelias," the elder Dumas, who is just dead, wrote a formal note to his son, as if they were utter strangers to each other, congratulating him on his success, greeting him as a worthy fellow-citizen in the great republic of letters, and expressing his desire to have a personal interview with such a promising young author. The son answered this complimentary effusion in the same high-flown strain, saying that he fully appreciated the honor conferred upon him, and that he should be most happy to meet the distinguished author of "Monte Cristo," of whom he had often heard his father speak in the very highest terms.

The subscriptions to the new five-per-cent. bonds of the United States brought the total up to fifty-odd million dollars. Considering that the whole are several weeks in advance of the readiness of the bonds for delivery, this

progress is not only rapid, but a sure evidence of the complete success of the loan. The first two hundred millions of the five per cents will be taken up before the bonds are ready for delivery on the 1st of May. The remaining three hundred millions, there is now good reason to hope, will be subscribed before the 30th of June, and the Treasury will then be enabled to enter upon the new fiscal year 1871-'72 with a gold-interest charge, upon the funded debt of the United States, reduced by five millions per annum from the present fiscal year.

Fedor Deetz, the German battle-painter, died at Gray, in France, of heart-disease, in December. He wore the red cross, and was one of the managers of the Baden sanitary corps. He had just given the finishing touches to the last picture that he ever painted, "Vienna besieged by the Turks," on the outer wall of the "Maximilian" in that city. His principal paintings were: "Death of Max Piccolomini," "The Night Review," "Destruction of Heidelberg by the French," "Blucher Crossing the Rhine," and "Blucher's March to Paris." He was born at Karlsruhe in 1812, and was court-painter to the Grand-duke of Baden.

A PRACTICAL EXPLANATION.

"Charley! what is osculation?"
 "Osculation, Jenny dear,
 Is a learned expression, queer,
 For a nice sensation.
 I put my arm, thus, round your waist,
 This is approximation;
 You need not fear—
 There's no one here—
 Your lips quite near—
 I then!"
 "Oh, dear!"
 "Jenny, that's osculation."

The number of volumes in the libraries of leading colleges and universities of the land: Columbia, 15,000; Union, 16,000; College of the City of New York, 16,000; Washington and Jefferson, 17,000; Pennsylvania, 17,450; Kenyon, 17,850; Wesleyan, 11,000; Michigan, 22,000; Marietta, 22,500; North Carolina, 23,000; Loyola, 25,000; Northwestern, 25,000; South Carolina, 25,000; Dickinson, 25,500; New Jersey, 28,000; Georgetown, 30,000; Bowdoin, 32,000; Amherst, 34,000; Virginia, 35,000; Cornell, 37,000; Brown, 38,000; Dartmouth, 38,000; Yale, 90,000; Harvard, 184,000.

Dean Stanley's parrot, which was a great pet, one day managed to open her cage and get away, to the consternation of the whole family. After a great search some one found Polly in the garden on the top of an apple-tree. The welcome news was communicated to the dean, who, with the whole of the inmates, rushed out at once, accompanied by Dr. Vaughn, who, with some friends, was then on a visit to the dean. Polly was found swinging herself on a topmost branch, but when she discovered the large audience below her, she looked gravely down on them, and said, "Let us pray."

A lady residing in a German city, which is heavily taxed by the war, writes to her friends that the cost of living is so much increased in consequence, that she has to pay sixty-five cents for a pair of white kid gloves "with two buttons;" that a new silk bonnet costs nearly a dollar in gold; a cab for two persons to the opera and back, thirty-seven cents, and washing is charged for at the extravagant rate of twelve cents a dozen pieces.

A Connecticut lawyer, who wished to cross the river on the ice, was told that it would be entirely safe to make the attempt if he crawled over on his hands and knees. Anxious to go, he humbled himself accordingly, and had laboriously got half way across when he was overtaken by a man driving along leisurely in a buggy. The rapidity with which he assumed an upright position was startling to the driver.

Robert Chambers, the celebrated publisher, who has just died in Edinburgh, worth, it is said, some six hundred thousand pounds, began life as a poor boy, entirely dependent on his own exertions, laying the foundation of his fortune by opening a small circulating library with a little borrowed money.

Thomas Carlyle enjoys the reputation of being the only eminent literary man in London who rises early in the morning. He not only gets up, but usually walks several miles before breakfast, or at least before undertaking the labors of composition.

Elder Miles Grant, the adventist, is credited with the statement that the New Jerusalem "would cover Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, and nearly half of Pennsylvania." The end of the world, in his opinion, must come before 1872.

Why was it, as an old woman in a scarlet cloak was crossing a field in which a goat was browsing, that a most wonderful metamorphosis took place? Because the goat turned to butter, and the antique party to a scarlet runner!

Animals require much water, varying according to size, food used, work done, and other circumstances. A horse requires eight gallons a day. A cow will drink six gallons, a sheep two to three quarts, while an elephant will use up nearly a barrel.

Dr. Holmes says: "Walking is a perpetual falling, with a perpetual self-recovery. It is a most complex, violent and perilous operation, which we divest of its extreme danger only by continual practice from a very early period of life."

A Mobile paper is indignant at a contemporary for announcing that "Mobile is the fourth coffee-pot in the country." Investigation proved that "cotton port" was meant.

Frugal landlady of boarding-house—"Coming home to dinner, Mr. Brown?" Hearty boarder—"Well, perhaps; if I don't feel hungry."

Voltaire's gardener is to Europe what Washington's coachman is to America. This gardener has just died again, near Geneva, at the age of one hundred and fifteen.

The "brierwood pipes" are nearly all made from laurel-roots, obtained in large quantities at very low prices in the lower counties of Maryland.

Italy exports corn, oil, flax, essences, wines, dyestuffs, drugs, fine marble, paintings, engravings, mosaics, and salt.

France exports wines, brandies, silks, fancy articles, furniture, jewelry, clocks, watches, paper, perfumery, and fancy goods generally.

The trustees of Racine College, Wisconsin, have provided a billiard-table and smoking-room for the use of the students.

It is proposed to insert a memorial window for Alice Cary in the "Church of the Strangers" in New York.

Immense coal-beds in the north of Greenland were among the discoveries of the German Arctic expedition.

The latest thing in woman's rights is a St. Albans lady who slaughters hogs.

How to get the exact weight of a fish—weigh him in his own scales.

The Museum.

IN our last number of the Museum we gave an illustration, from the second volume of Mr. Darwin's "Descent of Man," of the influence, as he supposes, of sexual selection on the conformation of birds. He attributes the power of song in the male birds to their desire to please and attract the females. He says few more careful observers ever lived than Montagu, and he maintained that the "males of song-birds and of many others do not in general search for the female, but, on the contrary, their business in the spring is to perch on some conspicuous spot, breathing out their full and amorous notes, which, by instinct, the female knows, and repairs to the spot to choose her mate." Mr. Jenner Weir says that this is certainly the case with the night-

ingale. Bechstein, who kept birds during his whole life, asserts that "the female canary always chooses the best singer, and that in a state of nature the female finch selects that male out of a hundred whose notes please her most." In some birds the vocal organs differ greatly in the two sexes. In the *Tetrao cupido* (of which we copy Mr. Darwin's illustration) the male has two bare, orange-colored sacs, one on each side of the neck; and these are largely inflated when the male, during the breeding-season, makes a curious hollow sound, audible at a great distance. Audubon proved that the sound was intimately connected with this ap-

paratus, which reminds us of the air-sacs on each side of the mouth of certain male frogs, for he found that the sound was much diminished when one of the sacs of a tame bird

was pricked, and when both were pricked it was altogether stopped. The female has a somewhat similar, though smaller, naked space of skin on the neck; but this is not capable of inflation. The male of another kind of grouse (*Tetrao urophasianus*), while courting the female, has his bare yellow oesophagus inflated to a prodigious size, fully half as large as the body; and he then utters various grating, deep, hollow tones. With his neck-feathers erect, his wings lowered and buzzing on the ground, and his long pointed tail spread out like a fan, he displays a variety of grotesque attitudes. The oesophagus of the female is not in any way remarkable.

Tetrao Cupido—Male.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER XIII.—MISS TRESHAM ASKS ADVICE.

Two weeks went by very quietly, and brought Miss Tresham's happy scholars to the beginning of their Christmas-holidays.

"Do your lessons well to-day, children," she said, as she entered the school-room on a certain Friday morning, and found them gathering about the blazing fire. "This is the last of school until after New-Year."

They all looked up delighted.

"To-day! And Christmas not till Thursday? Oh, Miss Tresham, that's so good of you!"

"Why, we'll have two long weeks—thank you, ma'am, so much."

"Don't thank me," said the governess, with a smile. "I should have kept you hard at work till Christmas-Eve. Your mother told me to dismiss school to-day, and that it will not be resumed till the Monday after New-Year. So, you see, you have two good weeks."

"Oh, haven't we!"

"Well, show your gratitude by giving me no trouble to-day. I will hear the geography first."

For the next fifteen minutes they were all busy locating capitals, settling boundaries, and describing countries. The children were so animated by the holiday prospect before them that they did remarkably well; and the class was about to be dismissed, when the door opened without any preparatory knock, and, instead of a servant, Mrs. Marks entered, with every sign of surprise and discomposure in her manner.

"Good Gracious, Miss Katharine, what's to be done! To think of such a thing just now of all times, and me deep in the mince-meat!"

Katharine looked up in astonishment. It was not often that Mrs. Marks used such a tone of supreme vexation, or appeared so red and worried—not often that she gave a glance so full of chagrin at her befloured dress and large domestic apron.

"What on earth is to be done?" she repeated, as Katharine's eyes met her own. "I never was so taken by surprise in all my life! To think of *her*—"

"What is the matter? Who is it?" asked the young governess. "I don't understand."

She understood the next moment, when Mrs. Marks pushed two cards across the table toward her—two cards exactly alike in appearance, and both bearing the same name:

Mrs. Annesley.

Katharine was too well bred to show exactly how much surprise she really felt. So, after one irrepressible exclamation, she hurried off at once into sympathy.

"Indeed, dear Mrs. Marks, this is very inconvenient! I hardly wonder you are vexed. Wouldn't it be possible to excuse yourself?"

"Excuse myself—to Mrs. Annesley!" Evidently that was not to be thought of.

"Well," said Katharine, with quite a practical inquiry, "why don't you go and dress? It will not take you many minutes to smooth your hair and put on your black silk. Shall I help you?"

"You! Why, I came to tell you that you must go down at once."

Was Mrs. Marks distracted? Katharine certainly thought so, as she drew back and gazed at her in sheer amazement.

"I go down to see Mrs. Annesley! Mrs. Marks, what can you be thinking of?"

"How are you going to help yourself?" demanded Mrs. Marks,

impatiently. "She came to see you just as much as she did to see me—indeed a great deal more, I expect, if the truth was known. Tom said that she gave him one of those cards for Miss Tresham."

"He must have been mistaken."

"How could he be?"

"I don't know," answered Katharine; "but he must have been."

"My dear," cried Mrs. Marks, almost angrily, "what is the use of this? If you don't believe Tom, I can tell you that I listened through a crack of the pantry door, and that I heard Mrs. Annesley ask for you. Of course she came to see you; and of course you must go down as soon as you have dressed. Come—quick!"

She laid her hand on Katharine's arm and strove to lead her forward; but the girl drew back with a decided motion.

"No," she said. "If I go down at all—if you are sure she asked for me—I will go down exactly as I am."

Mrs. Marks looked aghast.

"In that old dress! Oh, my dear, consider how important it is that you should make a good impression. Mrs. Annesley is so elegant—you have no idea! What would Mr.—"

A glance from Katharine stopped her short.

"I am breaking my usual rule in leaving the school-room to go down at all," she said; and since I do it principally to give you time to change your dress, I certainly shall not make any alteration in my own.—Children, look over your sums; I will be back soon to attend to them."

Before Mrs. Marks could utter another word of expostulation, she left the room and was descending the staircase.

She would scarcely have been a woman, however, if she had not stopped a moment outside the parlor door, partly to be sure of her self-possession, and partly to glance over her dress—the same dark-blue merino which she had worn the last day Morton was there.

When she opened the door, the room looked as rigid and cold as ever—perhaps a little more so, considering that the day was gloomy—but on the stiff, black sofa sat a figure, the grace and elegance of which would have brightened even a duller scene, and which rising, with a soft rustle of silk and velvet, met Katharine in the middle of the floor.

If Mrs. Annesley had expected some timid, blushing girl whom she could awe or patronize into reverence, she must have been greatly surprised at sight of the calm, stately young lady—unmistakably a young lady—who met her with such quiet ease.

"Miss Tresham, I presume?" she said, inquiringly—for despite all that Morton had told her, she could not believe that this was Mrs. Marks's governess.

And Katharine answered with Katharine's own straightforward dignity:

"Yes, I am Miss Tresham. Pray sit down, madam. Mrs. Marks will be here in a minute. She desired me to apologize for her delay, and say that she was very much occupied when you came."

"I am sorry to have disturbed her," said Mrs. Annesley, hardly conscious of what she did say, and only noting with a sharp pang every separate charm of this girl's appearance and manner. Then they sat down, and when the lady spoke again it was with a perceptible effort.

"I have heard a great deal about you—Miss Tresham—" she did not say from whom—"and it has been a regret to me that I have not been able to pay this visit sooner; but I am a very great invalid—so much of an invalid, that my friends are kind enough to excuse a great deal of social neglect from me."

Katharine thought there were very few traces of illness apparent in the smooth, handsome face before her; but she had enough of the habitude of society to accept the apology, and answer it with a few words of conventional sympathy—wondering the while, why it had been at all necessary to offer it.

"Thanks—you are very kind," said Mrs. Annesley, in acknowledgment of her condolence. "Yes, sickness is a dreadful thing—more because it is apt to make one neglect one's duties, than for any other reason, I think. Some people don't allow it to interfere, I know; but I have never been strong-minded. If I feel badly, I am sure to lie on my sofa, even with the consciousness of something that ought to be done."

"We are all of us prone to do that, I think," said Katharine; "and I, for one, really cannot admire the people who treat their bod-

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

as cruel drivers treat their horses, and goad them into exertion whether they feel like it or not."

Mrs. Annesley smiled faintly. "You are very good to say so, when I see plainly that you have no personal knowledge—no personal experience, that is—of the malady to which I allude. Do you sing much, Miss Tresham? I see the piano open, and surely your pupils have not yet advanced as far as Mozart."

The conversation rather flagged during the "minute" which unaccountably lengthened into ten or fifteen, before Mrs. Marks entered, Katharine began to grow a little impatient, and to wonder what could possibly be the motive of this visit. Had Mrs. Annesley merely come to gratify her curiosity, or what other meaning was hidden under her cold civility, her languid commonplaces, her keen though not ill-bred scrutiny? The young governess felt that she was undergoing a sort of examination, that she was on trial, as it were, before this fine lady; and feeling it, almost unconsciously she resented it. She who was usually so frank and cordial in her manner, was now reserved, almost haughty; while Mrs. Annesley made matters worse by a shade of patronage—half unconscious, half, it is to be feared, intended—which did not please the girl who had once told Morton that she was "unfortunately very proud." It was a relief to both of them when the door at last opened, and Mrs. Marks came bustling in, looking as if she had been hastily squeezed into her black silk, and had not yet recovered from the process.

Katharine watched the greeting between the two ladies—Mrs. Marks's hearty cordiality, a little tempered by awkwardness on the one side, and Mrs. Annesley's condescending suavity on the other—with quiet amusement. Then she kept her seat for a few minutes longer, thinking that after they were fairly launched into conversation, she would go back to her waiting pupils; but as it chanced, this intention was frustrated. Just as she had decided on leaving the room, Mrs. Annesley turned to her.

"I waited until Mrs. Marks was here, Miss Tresham, before I made a request which is partly the reason of my visit this morning. A few young people are coming next week to spend Christmas at Annesdale, and if you will be kind enough to waive ceremony, I should be very glad for you to make one of the party. Will you come?"

With all her self-possession—and it was even more than people gave her credit for—Katharine started. Was it possible that it was Mrs. Annesley who gave this gracious invitation?—who asked her to meet a party of young people (which was a modest way of saying the *dîe of Lagrange*) at Annesdale, which was the headquarters of gay hospitality? For a second she could not answer from absolute surprise; but she suddenly caught a glimpse of the ludicrous astonishment on Mrs. Marks's face, and it piqued her into an immediate reply.

"You are very kind," she said, looking, with her clear gray eyes, into the languid, handsome face; "I do not think much of ceremony, as a general rule, and I should be glad to accept your invitation, if it were possible. But it is not possible. I never leave home."

"You never have left home, perhaps," said the lady, smiling a little. "But, if you will pardon me, that is no reason why you should not begin to do so. Are you fond of gayety? I think Annesdale might tempt you a little in that way. Adela and Morton always manage to get up something amusing at Christmas. But I will not urge you—I will leave the matter to Mrs. Marks, and let her say whether or not you shall go."

She looked at Mrs. Marks, and Mrs. Marks, who had recovered her powers of speech by this time, was ready in a moment to take her cue.

"Indeed, I am sure Miss Katherine knows how glad I would be to see her go," she said. "It's very kind of you, Mrs. Annesley, to ask her. She has a very dull time, shut up here with Richard, and me, and the children; and I hope she won't let any of us stand in the way of her taking a little pleasure when there is such a good chance for it as this."

"I take charge of the children out of school, as well as in," said Katharine to Mrs. Annesley. "Mrs. Marks is anxious to give me pleasure, but my going would cause her a great deal of inconvenience; so I hope you will excuse me for declining your invitation."

"As for taking care of the children," said Mrs. Marks, before Mrs. Annesley could speak, "that's Letty's business, my dear, and not yours, as you know. You've spoiled her to death by looking after them yourself, and the sooner she learns to do it again the better.—I hope you don't think we work her to death," said the good woman, turning her attention to Mrs. Annesley, with startling rapidity. "She

took it all on herself, and I begged her again and again not to worry about them, though it's true they're so much improved—especially in their manners—that you'd hardly know them for the same children."

"Surely their manners would not suffer if you left them for the short space of a fortnight," said Mrs. Annesley to Katharine.

"For the matter of that," said Mrs. Marks, "I promised their Aunt Lucy that Katy and Sara should pay her a visit this Christmas; and you know, my dear, you don't have much to do with the boys."

"Mrs. Marks is evidently determined to get rid of me," said Katharine, with a smile, to Mrs. Annesley; "but I flatter myself she would miss me after I was gone. And so I think I shall abide by my resolution and remain."

"My dear," said Mrs. Marks, solemnly, "if you take my advice, you'll go."

"Take her advice by all means, Miss Tresham," said Mrs. Annesley, "or else give me one good reason for your refusal."

But one good reason, as society reckons good reasons, Katharine could not give. In our artificial condition of life, it is not considered a valid or even a courteous excuse to say that you have no desire to perform a certain action, or to go to a certain place. It is hard to imagine what could be a better reason for ordinary social refusals than the simple statement of disinclination; but, according to the rules of a certain arbitrary but very ill-defined code, it will not answer at all. If a man asks you to his house, you must not say that you don't want to come, but that you "have pressing business," or "a previous engagement," or a sick wife, or a dead uncle, or any other lie that may be convenient. If he finds you out, he will not be offended, he will take the pious fraud as it was intended. But if you had simply told the truth, and said that you felt unwilling to come, he would have had good right to be insulted. Knowing this as well as Mrs. Annesley, Katharine hesitated. She did not want to go to Annesdale, and she did not mean to go if she could help it; but still, social usages had a certain power over her, and, hemmed in by Mrs. Marks on one side, and her visitor on the other, she hardly knew what to say. Mrs. Annesley saw her embarrassment, and came to her relief.

"I am sure you think me very rude to press you in this way, Miss Tresham; but I am really very anxious that you should make one of our Christmas party, and that anxiety must plead my excuse. I see that you are half persuaded; and I am sure that, when you think the matter over, you will find there is no reason why you should not oblige us. My son you know already, and my daughter will be very glad to meet you. If I give you until to-morrow to consider, will you promise to say 'yes' then?"

"I am sure it is quite impossible," Katharine began.

But the lady had already risen, and was holding out her hand in parting salute.

"I shall either come or send for your answer to-morrow," she said; "and I beg you most sincerely to let it be favorable.—Mrs. Marks, I leave the cause in your hands. Promise me that you will make her come!"

"I'll do my best," said Mrs. Marks, dubiously; "but Miss Katharine's very hard-headed, and I'm afraid she'll go her own way."

"So much the better, if that way lies toward Annesdale," said the mistress of Annesdale, graciously. Then she shook hands with both of them, gave Mrs. Marks an invitation to Annesdale in that vague, general way which means "good-morning," told Katharine she was sure she would not disappoint her, and finally swept out, leaving behind her a faint fragrance and a vivid impression of affable smiles and soft speeches, and shining silk and rich velvet.

"Bless my soul, how she was dressed!" said Mrs. Marks, as soon as she was safely out of ear-shot. "Did you notice the quality of that silk? I never saw any thing half as heavy in my life. It must have cost three dollars a yard, if it cost a cent; and what an elegant bonnet! Well!"—with a long breath—"I am sure I never was more surprised in my life! I thought she would have been just the other way. But there's no telling what people will do for their children; and, after all, she mayn't be as proud as people say. Nobody could have been more polite than she was this morning. I was astonished you did not agree to go," she went on, addressing Katharine, with mild expostulation. "Of course you know your own affairs best; and I don't mean to intrude my advice upon you—for advice is a thing that everybody's anxious to give, and nobody's thankful to get—but you know what she came for, my dear, and I can tell you that she has done

a great deal for *her*; and, if you want my opinion, you'll be a great fool—simpleton, if you don't go to Annesdale."

"Then you will certainly consider me a great simpleton," said Katharine, coolly, "for I don't mean to go to Annesdale."

With this ultimatum, she walked off to the waiting arithmeticians, and left Mrs. Marks to return to her mince-meat with what degree of interest she could muster.

Dinner was over, and the short winter afternoon was more than half gone when Katharine opened Mrs. Marks's door, and, showing herself in her bonnet and cloak, asked if the former had any objection to her taking the children to Morton House. "They are anxious to return Felix's visit," she said (Felix had a fortnight before, made his long-promised call), "and Mrs. Gordon was kind enough to ask me to come to see her; so, if you have no objection, we will walk out there."

"I haven't the least objection," said Mrs. Marks, looking up from her work, and wondering not a little at the grand acquaintances her governess was making. "I am glad you are going to take the children yourself, Miss Katharine, for you can see that they don't behave badly, or make themselves troublesome to Mrs. Gordon. Isn't it rather a long walk, though?"

"Not for me," said Katharine, and shut the door.

The day had been overcast from its dawn, and the afternoon was very gray and gloomy when the governess and her merry troop went out into it. Every thing looked sombre and tintless, the bare trees stood out against a dull, leaden sky, the distant hills seemed desolate and brown, the broad fields were perhaps the most cheerless element of the scene, with their dun-colored hedges, their wide expanse of sere plants, and their fragments of unpicked cotton hanging in melancholy shreds from the withered stalks. All around the horizon was a broad band of pale-yellow light, and this, together with the singular softness of the atmosphere, made Katharine sure that there would soon be a change in the weather. "It will rain to-morrow," said Jack, looking up at the sky. "Miss Tresham, don't you feel the wind? Papa says that when it blows this way, it always brings rain. There, Ponto!—there goes a rabbit, sir!"

Ponto, who was a large Newfoundland dog, had been brought along for the purpose of chasing rabbits, and was not at all averse to the amusement. In fact, he saw the poor, little furry wanderer before Jack did, and was off at a mad gallop, followed headlong by all the children. A turn in the road soon hid them from the sight of the governess, and she gave a sigh of relief. She liked them, and their bright animal spirits never jarred on her as the spirits of grown people sometimes did; but just now she was glad to have the sombre winter scene all to herself, and much obliged to Ponto and the rabbit who had secured this solitude. To her, as to a great many other people, there was a singular charm in the leaden sky, the bare woods, and brown hills, the dun neutral tints which went to make up the scene. A far off, between some fields, there was a clump of trees, and a small house from which a column of blue smoke rose against the sky. Katharine looked at it wistfully. "I wonder if the people who live there are happy?" she thought. "I wonder if they look for any thing, expect any thing, dread any thing! Oh, me! I am sorry for them if they do!" As she went her way, between the zigzag rail fences and sere hedges, this train of not very cheerful thought colored the whole scene. She thought that she liked it because it agreed with her mood; but, in truth, if her mood had been different, every thing would have borne a different seeming to her eyes. So it is with us. If our hearts are heavy, the most beautiful landscape that ever smiled grows dark and dreary; while, if they are light, the sunshine from them overflows and colors with its own tints all the world around us. Katharine's world was made up of dull neutral hues just now, leaden grays, and cold browns, and dun, dark purples. We have no right to put the earth in mourning for our own troubles, but many of us do it nevertheless.

Morton House was farther off than she had remembered, and the afternoon was very nearly spent when she and her noisy charges walked up the avenue, and came in sight of the circular terrace and the brown old house set in the midst of it. This was Katharine's first fulfilment of the promise she had given Mrs. Gordon, and she could not help feeling a little nervous with regard to what her reception might be. Would the lady be kind and gracious, as she had been before? or would she think that, for a stranger, Miss Tresham was presuming too speedily on her invitation? "She is said to be very

eccentric," Katharine thought to herself, with a slight feeling of dismay—"one of the people who can be charming one day, and freezing the next, Mrs. Marks says. Will she be charming or freezing to-day, I wonder? I almost wish I had not come." It was too late for retreat, however. At that moment, from some quarter or other, Felix espied them, and bore down with a shout of pleasure. Five minutes later, they were entering the hall.

Felix left them in the drawing-room, while he went to announce their arrival to his mother, and in a moment returned, accompanied by Harrison. "Mrs. Gordon's compliments; would the children please go with Miss Felix to the nursery; and she would be glad to see Miss Tresham in her own room." This was the substance of the message delivered by the servant; and, while Felix led off his visitors, with eager assurances that the place where he was going to take them was not a nursery at all, but a good, big room, where his playthings were kept, Miss Tresham followed Harrison across the hall, and was ushered into the pleasant sitting-room where she had been introduced before.

Mrs. Gordon was lying on a couch by the fire, and looked very ill, her visitor thought. She raised herself, however, and, extending her hand, smiled with pleasant cordiality.

"So you are really as good as your word, Miss Tresham, and have come to see me. I need not say you are heartily welcome. Sit down. Is it not very cold and gloomy out-of-doors?"

Evidently, if Mrs. Gordon was "eccentric," and had different moods for different days, this was one of her most gracious moods, and one of her brightest days. At least, so Katharine thought, as she felt that her instinct about the visit had not misled her, and as, obeying the motion of her hostess's hand, she sat down by the fire. She did not know whether to allude to the traces of suffering so plainly marked on her companion's face; but the latter relieved her uncertainty on this point at once.

"I have been quite ill," she said, "and I am sure you think that I am still, in looks at least, the worse for it. At my age, one shows so plainly things which pass unnoticed in youth. If you had come a day or two ago, I could not have seen you; but to-day I am grateful for the presence of such a bright face."

The bright face smiled and blushed a little at this, but soon recovered its usual composure.

"I am glad I came, then," said Katharine. "I was a little doubtful, thinking I might trouble you. But I always mean what I say myself, and I gave you credit for meaning what you said when you asked me to come."

"You were quite right," said Mrs. Gordon, smiling; "I meant exactly what I said, and perhaps a little more. I have lived a long time in the hottest fever of the world," she went on, "and this stagnant life is almost too much for me. In a measure, it was pure selfishness which made me press you to return. I cannot ask the people of Lagrange to come here. I have gone out of their life and their world forever. But you are different. The first moment I saw you, I knew that you were different; and I knew, or thought I knew, that you would be a person worth knowing, and a companion worth having."

"You flatter me," said Katharine, with her breath a little taken away.

"I never flatter anybody," answered Mrs. Gordon, coolly. "You know as well as I do that, although you are not particularly pretty and, for aught I know, may not be particularly clever, you *are* particularly attractive. I don't wonder—" she paused, with a smile; then added, "Won't you take off your bonnet, and spend the evening with me?"

"I should be very glad to do so; but I have the children under my care, and I must take them home before dark."

"Can't they go home by themselves? can't Babette take them? Well"—as Katharine shook her head in reply to both propositions—"I won't press you. But leave the children at home another day, and come prepared to spend the evening. Surely, your holidays begin very soon now?"

"They have begun already. To-day was my last of school."

"I am glad to hear that. I can hope, then, to see you often in the course of the next two weeks?"

"I—don't—know," said Katharine, doubtfully. The moment afterward she caught a look of surprise on Mrs. Gordon's face, and went on, hastily: "I mean that I may not be at Mrs. Marks's during the holidays. I received a Christmas invitation to-day, and I have been doubting whether or not I should accept it. Would"—a pause

"would you think me very impertinent, Mrs. Gordon, if I asked your advice about doing so?"

"I should not think you impertinent at all, Miss Tresham; and I should be very glad to advise you to the best of my ability, leaving selfishness out of the question."

Katharine sat still and looked in the fire for a minute, puckering her brow into a slight frown as she did so. Then she turned round and smiled at her hostess.

"Don't think me very vacillating and irresolute," she said; "but the fact is, I declined the invitation this morning, and I told Mrs. Marks at dinner that I positively would not accept it; yet such is the perversity of human nature that I am half inclined to retract my own words now, and go. If one or two doubts could be solved for me, I think I should."

"And can I solve those doubts?"

"If you choose, I am sure you can. Of course, you know enough of your cousin to tell—"

She stopped short, for Mrs. Gordon raised up and looked at her with astonished eyes.

"My cousin?" she repeated. "You surely don't mean Mrs. Annesley?"

"Yes, I do," said Katharine, laughing a little. "You can't be more surprised than I was. I had never seen Mrs. Annesley before; and this morning she called on me, and absolutely asked me to spend Christmas at Annesdale—more than that, she would not accept a refusal; but, when I declined the invitation, said that she would give me until to-morrow to consider, and would send for my final answer then. Now, if I am not impertinent, pray tell me what she means by it, and what I ought to do."

Mrs. Gordon sank back on her cushions, and smiled. Instead of answering Katharine's question, she asked another:

"You say that you would like to go?"

"Yes," said the girl, frankly. "I like pleasure very much—more than is right, I am afraid—and I should like very much to go. It has been four years since I danced the last time," said she, looking at Mrs. Gordon gravely; "and I should like to go to another ball. There is always a Christmas ball at Annesdale, Mrs. Marks says. If I knew why Mrs. Annesley asked me, and if I could be sure that she really wants me, I should certainly take the goods the gods provide, and go."

"Go, then," said Mrs. Gordon. "Take the goods the gods provide, and enjoy them while you can. I am able to set your mind at rest on both those points. I think I know why Mrs. Annesley asked you; and, as she asked you, I am sure she wants you to go."

"This is your advice?"

"This is certainly my advice."

"Not given because I was foolish enough to say that I liked pleasure, but honestly and sincerely?"

"Honestly and sincerely," answered Mrs. Gordon, smiling. "You don't suppose I would think you worth much if you had not youth enough in you to like pleasure? The love of it is born in us, and is the strongest cord that draws us heavenward, as well as the heaviest fetter that binds us to the earth. Don't grudge your youth its natural impulses and pleasures. Believe me, the apathy and the distaste of later life will come on you soon enough."

"But Annesdale—" said Katharine.

"Go to Annesdale, by all means. I don't simply advise; I am bold enough to urge you to do so. Shall I tell you why? You are not a simpering, foolish young lady; so I think I may. It is evident that Mrs. Annesley, from personal reasons—don't blush, my dear, for I don't mean to be as plain-spoken as I was before—is anxious to see and know you. She has taken a better way of doing this than I should have given her credit for—a more delicate way, that is. Don't deny yourself a pleasure, and repulse her at the same time. If you have any liking, any cordial friendship, for Morton, meet his mother's advances frankly, and go to Annesdale."

"But," said Katharine, blushing deeply, despite her companion's admonition to the contrary, "that is exactly why I hesitate. Mr. Annesley has been very kind to me—if we were on the same social level, I might almost say very attentive—and I don't know what construction might be placed upon this visit."

"My dear," said Mrs. Gordon quietly, "society is a state of hollow but very useful forms. We all know that they are hollow, but still, we all observe them. Mrs. Annesley has asked you to spend Christ-

mas at Annesdale, and you are not supposed to know any thing of the motive for this invitation. If any motive is concealed beneath it, what difference does that make? If she asks you for one reason, and you go for another, what matter of that? Have you not lived long enough in the world to know that life—this outside, social life—is merely a game of chance and skill? This visit will bind you to nothing. The day after you come away, or the day before, for that matter, you will be at perfect liberty to reject Morton if he asks you to marry him. I hope you won't do any thing half so foolish, though," she added, with a smile. "I knew his father well; and Morton is Edgar Annesley over again. No girl could ever do better than to accept him."

"I am sure of that," said Katharine, kindly and cordially. But she did not say it as if she had any personal interest in the question of accepting or rejecting the young owner of Annesdale. She spoke with her eyes fastened thoughtfully on the fire; and when she looked up, she added suddenly, "Then once for all, you advise me to go?"

"Once for all, I do. Will you prove an exception to most advice-asking people, and take my advice?"

"Yes, I will," said the girl, rising and standing before the fire, with the ruddy light flickering over her bright face and graceful figure. "I am very much obliged to you for giving it," she went on; "and I should be very ungrateful if I did not take it after you have been so frank with me. I shall write to Mrs. Annesley to-morrow, and tell her that I accept her invitation. May I come to see you when I return, and tell you how much I have enjoyed myself?"

"Come to see me certainly, and tell me all about it. I shall be very glad to hear every thing. But must you go now?"

"Yes, it is growing late, and we have a long walk from here home. Neither the children nor myself mind it, though," she added, as the word "carriage" formed on Mrs. Gordon's lips. "I must bid you good-evening, and I hope you will be well when I come again."

With a sudden impulse which, if she had stopped a minute to consider, would certainly have been repressed, she bent down and laid her lips on Mrs. Gordon's cheek. It was a very light caress, but the latter felt it and started. Then she looked up with a smile.

"You are certainly very charming," she said. "I don't wonder that others, beside myself, have found it out."

CHAPTER XIV.—R. G.

WHEN Mrs. Annesley reached home, she found that the whole family of Taylors, mother and daughters, had arrived at Annesdale during her absence, and were established to "spend the day," according to the irksome custom which then prevailed, and for that matter still prevails, in country districts. Their bonnets were laid aside, their work was brought out, and the drawing-room was full of the sound of their chatter and laughter, when the lady of the house entered. Poor Adela was on duty, and gave a glance compounded ludicrously of resignation and disgust to her mother. Mrs. Annesley telegraphed a reply in much the same spirit, then swept forward and greeted her guests with effusion. "Dear Mrs. Taylor, what a pleasant surprise! How kind of you to come!" etc., etc.—"Maria, how well you are looking!—Fanny, has your neuralgia quite gone?—Augusta, I need not ask how you are—I never saw you more blooming. Of course you have come to spend the day. I cannot think of letting you off," etc.

They all spent the day with religious exactitude. It was nightfall before the last item of news was discussed, the knitting-needles and worsted-work put away, the bonnets resumed, and the carriage ordered. Mrs. Annesley gave a heart-felt sigh as she stood at the window and watched them drive away. "What a relief!" she said. "It is dreadful to think what bores those people are!"

"The night is going to be dark, and the roads are very heavy," said Adela. "I shouldn't be surprised if they had a bad time getting home—and serve them right, too, for staying so late! Now, mamma, what news? I have been dying to hear, ever since you came; and I thought they never were going."

"Nothing very satisfactory," her mother answered, without turning round. "She declines to come, Adela."

"What!" said Adela; and, even in the soft mingling of firelight and twilight, it was evident that her face fell. "It can't be possible that she declines to come, mamma!"

"She does, though. She refused the invitation absolutely and not very courteously."

"Then what will you do?"

"What I will do is yet to be decided—what I did do was to decline to accept her refusal. I insisted on her taking a day to consider the matter, and said I would send for her answer to-morrow."

"That is more than I should have done," said Adela, flushing. "She will think she has gained every thing."

"She is welcome to think so," was the quiet response.

"It is nothing but insolence!" cried Mrs. French. "I wish I had her in my power, I'd—I'd strangle her! Mamma, I don't see how you ever submitted to it!"

"We must submit to a great deal, Adela, if we want to carry our points."

"And do you think you will carry this one?"

"I think she will come."

"But if she don't?"

"Then I shall be disappointed, but not seriously so. All I need is time; and time, I think, I can induce Morton to grant me. Since I have given a conditional consent, he has promised that he will not speak until I have seen and judged of—of this governess."

"I should make that a long process."

"No; for I hope it will not be long before I have proofs concerning her which not even Morton can disregard."

"And meanwhile?"

"And meanwhile, she cannot fail to suffer by close contrast with Irene Vernon. She is not pretty, Adela."

"N—o, mamma, not pretty, perhaps—but handsome in a certain style that men like. If you could have seen her talking to Morton at the pond that day! It was all her fault that he lost sight of that hateful child, and had such a frightful accident. Of course, Irene is a beauty—but I wouldn't trust to this girl's not being pretty, if I were you."

"Trust to it! You don't suppose I have lived to my age, without learning that there are many things besides a pretty face that make a fool of a man. It certainly is not this girl's face which has turned that poor boy's head. Let me see—what is the day of the month?"

"The nineteenth," answered Adela, wondering a little at the question.

Mrs. Annesley walked to the fire, making some calculation as she went. Mrs. French, who had meanwhile taken a seat, watched her with languid interest. She did not pretend to understand all her mother's schemes; but her reliance was, in a different way, quite as complete as Morton's. She had the most profound admiration for her mother's diplomatic abilities; and did not honestly believe that any cause was hopeless as long as she retained the management of it.

"Well, mamma," she said, at last, "what are you thinking about?"

"I am thinking," answered Mrs. Annesley, absently, "how long it takes a letter to go to London, and an answer to return."

"A letter?—to go?"—Adela sat up and stared at her mother. "A letter to go to London! Mamma, what do you mean?"

"I mean," said Mrs. Annesley, glancing round at the closed door, as if to make sure that nobody was within hearing—"I mean that I have no idea that my son shall marry an adventuress; and that I have been making inquiries about Miss Tresham for some time."

Mrs. French gave a little scream, half of excitement, half of slightly comic alarm. "Good gracious, you don't say so! Why, this is becoming quite interesting. Wouldn't Morton be vexed if he knew? Tell me all about it, mamma—how long ago did you begin, and what have you found out?"

"I can't talk about it here," said Mrs. Annesley, a little nervously. "Morton might come in any minute; and I would not let him know for the world. When I have found out what I want to know, I shall lay the matter before him; but, until then, he would not listen to any thing I could urge. His scruples on the subject are absurd."

"Most of his ideas are," said Mrs. French, coolly. "Dear me, there is his step in the hall! May I come to your room to-night, mamma, and hear all about it? Say yes, please."

"I suppose you may, though I am half-afraid to trust you."

"Never fear about trusting me. I'm not like some foolish women, who tell every thing to their husbands. Frank is a good fellow, and tells me all his secrets; but he don't hear any of mine.—Do you, Frank?"

"Do I what, Adela?" asked Frank, who entered at the moment in a very splashed and disreputable condition. "I don't mean to stop a minute," he said, hastily, as he was transfixed by his wife's glance. "I only came in to tell you what splendid luck we've had. I never saw the pond so flush of ducks before. Morton's a better shot than I am, and he bagged no less than—"

"Frank, if you don't go up-stairs this minute and take off that abominable corduroy, I will never speak to you again!" cried Mrs. French, in a high-treble key. "It smells horribly! Who cares about your miserable ducks? I don't!"

"You'll care about eating them, I expect," said the good-natured Frank, as he left the room rather crestfallen, and went to change the objectionable corduroy, which, being thoroughly wet, had, in fact, a very far from agreeable odor.

A few minutes afterward Morton entered, and, having had the discretion to change his dress, was welcomed more cordially than his fellow-sportsman had been.

In answer to his mother's inquiries, he said that they had had a very good day's sport; that the ducks were plenty, and by no means hard to approach; and that their game-bag was full.

"Frank enjoyed it extremely," he said, in a tone that was rather tired. "For my part, I am not as fond of sport as I used to be."

"I suppose it takes a fox-chase to rouse you," said Mrs. Annesley. "By-the-way, there will be some fox-hunting next week, will there not?"

"To be sure," answered Morton. "French was talking about it to-day. Langdon, and Talcott, and half a dozen more, will be here, who care for little besides fox-hunting. I wrote to Godfrey Seymour and told him to bring his hounds with him when he came."

"Isn't your own pack a good one?"

"The more the merrier, you know; and no bounds are like Seymour's. He has the best-trained pack in the country."

"I hope he will come."

"I hope so, indeed, for his own sake as well as on account of his dogs. There isn't a better fellow living than Godfrey. Is your party quite made up, mother?" he went on. "If there is anybody else to be invited, you know you ought to be attending to it. Almost everybody has made engagements for Christmas by this time."

"There is nobody else to be invited," said Mrs. Annesley. She paused a moment, then added, quietly: "I gave the last invitation in Tallahoma to-day."

"In Tallahoma!" echoed her son. "Who did you ask in Tallahoma? John Warwick?"

"No, quite a different person. Miss Tresham."

The young man started. That name was the last he had expected to hear, and looked at his mother for a moment in surprise. Then he went round to the back of her chair, and, bending down, kissed her brow just where the hair was parted.

"My dear mother, thank you," he said, simply.

"Don't thank me," said Mrs. Annesley, in rather a hard voice. "I need not tell you that it cost me a struggle, Morton. But I promised you to see and know her, and I thought this opportunity the best for the purpose. People will wonder, no doubt; but we must submit to that."

"Let them wonder," said he, a little haughtily; but his tone softened, as he added: "You were quite right; this will be the best opportunity for seeing and knowing her. Is there nothing that I can do for you, mother?" he went on. "Is there nothing you could ask of me? I should like to show you in some way how much I appreciate the sacrifice you have made."

"Yes, there is one thing," said Mrs. Annesley, perceiving her advantage, and seizing it without an instant's hesitation. "You can certainly do one thing for me, Morton. I have asked this girl here for your sake. For my sake promise me that while she is here you will refrain from paying her any marked attention, that you will not give people any opportunity to couple your name and hers together."

Morton's brow contracted a little. He thought his mother had taken an unfair advantage of his offer, but he did not say so; indeed, after a moment, he saw that he had no alternative but to consent. He had rashly laid himself open to this, and he must abide by his own words.

"I promise," he said, a little coldly, "but I did not think you would have asked such a thing of me."

His mother rose and laid her hand on his shoulder.

"Why, my dear son? Why should I not ask it of you? You know where all my hopes for you are fixed. Can you wonder that I do not wish you to put an impassable barrier between yourself and their fulfilment?"

He knew what she meant—he knew she was thinking of Irene Vernon—so he did not answer. He had very sensitive ideas of his own, and he showed them in nothing more than in the reticence he always observed with regard to topics like these. Nothing would have induced him to mention Miss Vernon's name in a connection of this sort. After a while, he sighed a little, and put his arm round his mother.

"You must bear with me," he said. "Mother, dear, it is hard that at this late day I should begin to be a trouble to you; but be patient, be hopeful, and perhaps in time we may live it down."

Mrs. Annesley went to her own room early that night. She was tired, she said; her drive to town and the Taylors together had quite exhausted her, and her only chance of being moderately well the next day was to retire at an hour that Adela was fond of calling uncivilized—Adela's pet idea of civilization being to go to bed at one o'clock and rise at twelve. To-night, however, Mrs. French made no demur at the move. She yawned and said the Taylors had done for her, too, then bade her brother good-night, and followed her mother up-stairs.

"You are going to smoke?" she said to her husband, who muttered something of the sort in the hall below. "Oh, very well; take your time about it; I am going to mamma's room for a while."

Her face vanished from over the balustrade, and the minute afterward the two gentlemen heard her dress rustling along the upper passage, and the opening and closing of Mrs. Annesley's door.

"They are good for a two-hours' gossip at least," said Mr. French, on hearing this. "That's their notion of 'going to bed early and getting a long rest!' Come, Morton, we'll have a smoke. Do you know where the papers are that came this morning?"

In Mrs. Annesley's chamber a large fire was blazing brightly and making the whole room radiant with that beautiful glow which a judicious mixture of pine, and oak, and hickory, can alone diffuse, when Adela entered. It rendered any other light almost unnecessary; but a lamp burned with quiet, steady lustre on the table at Mrs. Annesley's side, and, scattered around its base, were several letters and a newspaper. She looked up from the pages of one of the former when the door opened and she saw her daughter.

"I thought your curiosity would not let you remain down-stairs long," she said. "Come in, but be sure and close the door securely."

"Well, mamma, I'm all impatience," said Adela, after she had waited some time, and her mother took no further notice of her, but went on reading the letter she held.

"Look at that, then," said her mother, pushing the newspaper across the table and pointing with her finger to a particular paragraph.

Adela took it up wonderingly. The sheet was mammoth, and proved to be a copy of the London *Times*, in date five or six months old. Following the direction of the finger, her eye fell at once on the following advertisement:

"If the friends or relations of Katharine Tresham, formerly of the British West Indies, and lately of Cumberland, England, are desirous of knowing her present whereabouts and address, they can obtain this information by addressing R. G., box 1084, Mobile, Alabama."

Adela first stared, then caught her breath, and looked up at her mother.

"Is it possible you wrote this, mamma?"

"Yes, I wrote it," Mrs. Annesley answered. "I could not let matters go on as they had been doing for months past. I felt, and I still feel sure there is something wrong about the girl. Being confident of this, and seeing Morton's growing infatuation, I knew that to lift the curtain from her life was the only hope of saving him. If I have done her harm, she has only herself and her ambitious schemes to thank for it. Any parent would hold me more than justified in the means I have used."

"Oh, as for that," said Adela, "I think the means are excellent. But I wonder how you ever thought of them, and how did you get this inserted?"

"I sent it to Mr. Russell when he was in England last summer. He is thoroughly trustworthy, and will neither mention the fact nor ask any questions. It was inserted in the *Times* for a month, and he sent me this copy."

"Did any thing come of it?"

"Something came of it sooner than I had ventured to hope. Before the advertisement had appeared a week, a letter was written, and reached me in due time."

She handed a letter across the table, and Adela received it eagerly. Her curiosity was fairly in a flame, and, although she tore open the folded sheet very hastily, she had still time enough to observe that the paper, writing, and whole style of the missive, were unexceptionable. It was evidently written by a man, and was quite terse:

"If R. G. can give any accurate information concerning the present whereabouts and address of Katharine Tresham, formerly of Porto Rico, in the West Indies, and lately of Dornthorne Place, Cumberland, England, he will be entitled to the thanks of her friends, and can obtain a liberal reward by addressing Messrs. Rich & Little, Lincoln's Inn, London."

After Adela read the last words twice over, she looked up at her mother, and shrugged her shoulders. "I don't think the reply tells much more than the advertisement," she said.

"When that came," answered Mrs. Annesley, "I saw in a moment that I had gone to work wrong—that instead of offering to give information, I should have asked for it. I saw there was a secret to keep; and this friend who offers me a liberal reward, and refers me to a couple of lawyers, was as much interested as the girl herself in keeping it. I felt sure, however, that he did not know her whereabouts, that he was honestly anxious to be enlightened. In that case, I thought I saw my way, and this is what I wrote."

Again she pushed a letter across the table, and again Adela took it up and read:

"If the gentleman who referred R. G. to Messrs. Rich & Little will communicate his own address to box 1084, Mobile, Alabama, he can obtain the information he desires, and be spared the payment of a reward."

"Well! and what was the answer to this?"

"The answer to this came very shortly, and puzzled me not a little. Here it is."

The second missive, in the same writing, and on the same paper as the first, was in turn handed across the table and read:

"Mr. St. John has received R. G.'s letter. If R. G. possesses any real knowledge of Miss Tresham's place of abode, and objects to communicating that knowledge through Mr. St. John's lawyers, he can address directly—

"HENRY ST. JOHN, Esq.,
"Poste Restante,
"Buden."

"Mr. St. John!—Mr. St. John's lawyers!" repeated Adela. "Well, Miss Tresham certainly seems to have a grand sort of person interested in her! Dear me, mamma, suppose she has run away from her friends, and is really a lady, after all?"

"She is much more likely to be an adventuress," said Mrs. Annesley, bitterly. "That high-sounding name did not deceive me for a minute. By return mail, I forwarded her address to Mr. Henry St. John, and requested some information concerning her, for personal and family reasons. No answer whatever came to that letter. After waiting some time, and finding that none was likely to come, and that evidently nothing had occurred to call Miss Tresham away from La-grange, I wrote to the lawyer in Mobile, through whom I received these letters, and requested him to make inquiries in London about this Mr. St. John. He did so at once, and I am now waiting to hear the result. It may be some time before I obtain the facts I want, but every thing is possible to patience and money, and I shall obtain them in the end. If it takes my whole fortune," she went on, passionately, "I will obtain them, sooner than let my son wreck his life by marrying this woman."

"I am inclined to think that Mr. St. John is a nice person," said

Adela, gravely regarding the two letters that lay open on the table before her.

"I am sure he is a sharper," her mother retorted, "and probably in league with Miss Tresham. Why he should have noticed my advertisement at all, puzzles me."

"Perhaps because he was afraid somebody else would," said Adela, too lazy to do battle for her own "nice-person" theory. "Well, mamma, when do you expect to hear something definite about him?"

"I wrote to Mr. Burns the other day, making the inquiry," her mother answered. "I was looking over his reply when you came in. There it is—you can see it if you choose."

"Of course I choose," said Adela; and suiting the action to the word, she took the indicated letter and opened it. Mr. Burns was the Mobile lawyer of whom Mrs. Annesley had spoken, and this was what he said:

"DEAR MADAM: Your favor of the 8d ultimo came safely to hand. In reply to your inquiries, I am able to say that I hope soon to hear from my agent in London, with regard to the information you are anxious to receive. I anticipate little difficulty in obtaining this information, if the addresses which you have furnished me are at all correct. The solicitors at Lincoln's Inn will certainly be able to satisfy you concerning the real character and standing of Mr. St. John. If we should meet with any difficulty there, it will be a little more troublesome, but quite as practicable to make these inquiries through other channels. In either case, you may be sure of receiving reliable information in a comparatively short time. I have also forwarded to my agent your copy of Mr. St. John's letter, giving the name of the place where Miss Tresham resided in Cumberland. By prosecuting his inquiries there, he may be able to learn something of this lady. I hope to receive a letter by the middle of the month, and will forward it to you immediately.

"Assuring you of my continued secrecy, and acknowledging your desire that I will not spare expense, I remain,

"Very respectfully,

"WILLIAM F. BURNS."

Adela philosophically folded up the letter, and returned it to her mother.

"I see now why you gave your consent," she said. "You wanted to make Morton defer matters, and so gain time."

"It was my only hope," said her mother. "I knew that if once Morton spoke to the girl, he would hold fast to his word through every thing. Now I may stave off a declaration, until I can show him who and what she is."

"If that is your hope, I should think you were very unwise to ask her to spend a week in the same house with him."

"And you don't know that by this very thing I took the surest means of binding him to his promise. He would do any thing sooner than break it now, that I have, as he thinks, made such a sacrifice for him. But that was not my only reason for asking her. I wanted her here—in my power, under my hand. When the letter from London comes, I want to give her a choice between open exposure, or leaving Lagrange. Then I do not believe that, once contrasted with Irene Vernon, she could continue to attract Morton."

Adela shook her head.

"That's your mistake, mamma," she said. "Morton has known Irene Vernon as long or longer than he has known this girl, and do you suppose he never contrasted them in his mind? I am as anxious as you can be that he should fall in love with her; but I don't think it is likely just now."

"We shall see."

"Yes, we shall see. But, for my part, I don't believe Miss Tresham will come. I am sure she has sense enough to distrust an invitation to Annesdale."

"That may be; but, nevertheless, I think she will accept it."

The event fully justified this belief. The next day was cloudy and stormy in the extreme, but Mrs. Annesley dispatched a messenger to Tallahoma, and waited anxiously for his return. In an hour or two, a damp note, woefully limp, and odoriferous of wet linsey, was brought to her. She opened it with two fingers, read the few lines which it contained, and looked up at her daughter with a smile.

"It is all right, Adela," she said. "She will come."

[TO BE CONTINUED.]

A DAY AND NIGHT AT MOUNT VERNON.

ONE day last spring I received from the regent of the Ladies' Association who now have charge of Mount Vernon, a cordial invitation to visit the place in which, as the wife of one of the few living representatives of the Washington family, I might claim to have a almost hereditary interest.

After a pleasant voyage from Washington in the comfortable little steamer Arrow, we reached the wharf at noon, where a carriage was waiting to convey me to the house. Following a winding road up the hill, under the overarching branches of fine old trees, I soon reached the main entrance, where I found Nathan, an old servant of the Washington family, a fine-looking middle-aged man, well dressed, and with striking courtesy of manner, who acts as *major-domo* to visitors ready to hand me from the carriage, and take charge of my satchel. On entering I received a cordial welcome from my friends, and felt something like Rob Roy when he exclaimed, "My foot is on my native heath, and my name is McGregor."

The house is large and imposing; on the river-front a portico extends its full length, the tall white columns reaching to the roof, adding very much to its commanding appearance. The centre portion of the mansion was built by the original owner, Lawrence Washington, an elder half-brother of the general, who married a daughter of the Hon. William Fairfax, a relative of Lord Fairfax, and a gentleman of consideration; at one time president of his majesty's council in the colonies. Lawrence died at the age of thirty-four, bequeathing the estate to his only child, a daughter; and in the event of her death without heirs, to his favorite brother George, into whose possession by this child's early demise, the property finally came. It was called Mount Vernon from the British admiral of that name, with whom Lawrence had sailed on the expedition against Carthage, and to whom he was indebted for much kindness. In a letter to his father, Captain Augustine Washington, at Fredericksburg, Virginia, written from Jamaica, May 30, 1741, he says: "I shall avoid saying much of our Carthage expedition, the success of which you will soon have in print. We destroyed, in short, eight forts, six men-of-war, six galloons, and some merchant-ships, etc. I have remained on board Admiral Vernon's ship, ever since we left Hispaniola, vastly to my satisfaction."

There is a portrait of Lawrence in possession of a member of the Washington family. It shows him dressed in the British uniform of red coat and blue vest, displaying a portion of the ruffled shirt above; a black chapeau under his arm, ornamented with bow and button on its side. The oval face is handsome, and has in it the chivalrous look of an old-time cavalier. His complexion is dark as a Spaniard's, with strongly-marked black eyebrows arching over dark eyes, broad, high forehead, aquiline nose, firm chin, and pleasant mouth—very dark hair arranged in a *queue* behind, smooth on either side of the face, with formal curls over the ears. Such in appearance was the original owner and builder of Mount Vernon.

The private parlor where we took lunch was once a family sitting-room; a smaller apartment adjoining, that overlooks the river, is said to be the one in which the Farewell Address was written; both rooms are comfortably furnished; some of the articles of furniture being quaint old-fashioned relics presented to the association by different friends. Between the windows hung a mirror in an antique frame, one hundred and fifty years old, presented by Mrs. G. Van Rensselaer, the plate glass having been also presented by some generous manufacturers.

On the walls hung pictures of General Washington and his wife, also a peculiar profile engraving of him very singular in its style, and unlike any other I have seen. The boat having left with the daily visitors, we proceeded without interruption upon our inspection of the house, which has been recently repaired, repainted, and generally refitted, under the supervision of General Michler, commissioner of public buildings, and his agent, Mr. L. T. Follensbee. About a year ago, the ladies of the association secured, through the energetic efforts of the regent, after much exertion and delay, an appropriation from Congress of seven thousand dollars, for damage and loss sustained by the stopping of their boat during the war, this being almost the only available source of revenue to the association.

The house had fallen sadly into decay, and needed immediate repairs to preserve it, as did also the out-buildings. This money was

placed at the disposal of General Michler, and Mr. Follensbee was appointed to supervise the work, which has been well done.

Externally, the mansion has been painted and sanded in its original style, in imitation of stone. Within, some of the rooms have been repapered in old-style patterns, others repainted, and the walls colored; many contributions in material having greatly aided the work. Passing from the sitting-room across a wide passage or hall extending through the house, we entered a small room, called the west parlor, with some pictures upon the walls, and over the old-fashioned corner fireplace, the Washington coat-of-arms carved and filling a framed panel. Above it there was a dim old painting of a naval scene, covered with glass to protect it from being chipped off, and carried away as a part has been already, by those insatiable vandals, relic-hunters. From the west parlor we entered the banquet-hall, the handsomest room on the first floor, used by Washington on state occasions, as a reception or dining-room, and in which his body was laid in state after his death. The arched ceiling of this beautiful room is elegantly ornamented in stucco with graceful garlands, the design including many devices emblematic of agricultural pursuits. The floor is covered with a very handsome oil-cloth, manufactured in New York, and contributed by a gentleman of that city.

Many relics are collected in this room, among them a number of antique chairs presented by different parties, all having some historic association; one being an original that came over in the Mayflower; also a harpsichord presented by Washington to his wife's granddaughter, Eleanor Custis. The white marble mantel, exquisitely carved in Italy, was presented to Washington by a gentleman of Philadelphia (I think Mr. James Vaughan). A black marble mantel, understood to have accompanied this, was given by General Washington to his brother, Colonel Samuel Washington, of Harewood House, Jefferson County, West Virginia, whose descendants still reside there. We passed on into the east parlor, where other relics are to be seen; belsters for pistols, and military accoutrements used during the Revolution; also, in a case with glass doors, a suit of clothes. There is a stuff-colored coat of antique style, breeches to match, a waistcoat of handsome material in bright colors, and a pair of long silk stockings, darned and carefully marked in black letters, G. W. 2, 97. This suit was rescued from obscurity and presented to the Ladies' Association by William D. McGregor, of Hudson City. In this case is also to be seen a most invaluable and interesting relic, a lock of Washington's hair, gray, mingled with brown, fine, soft, and silky as a child's.

Two stairways, one at either end of the house, communicate with the upper floor. Over a door in the hall hangs a small case, containing a ponderous, curiously contrived key, that once unlocked the dreaded door of the Bastille. This key was sent by Lafayette to Washington. A handsome Wilton carpet, presented by a friend of the association, covers the main staircase. Half way up, on the landing-place, stood an "old clock on the stair," one of those stately, dignified, cumbrous institutions of the olden time, its dial ornamented with the moon's face, its wide-open eyes peering out with an evil look, as if it could tell the living present of the dead past.

From the regent's apartments through a short passage we enter a large, handsome room at the south end of the house, corresponding with the banquet-hall at the north end. This room was once used as a library, afterward as a dining-room. These apartments were additions made by General Washington to the original building. Above the doors were plaster casts of Washington and Lafayette. A handsome marble bust of the "Chief," as he was often called, has been placed in the banquet-hall by Mrs. P. Edgeworth Eve, the vice-regent from Georgia. It is a fine work of art, and deserves especial mention. Ascending a narrow stairway at this end of the mansion, we first enter a chamber over the library, in which Washington died after four days' illness. On the wall hung a framed copy of the *American Gazette*, containing an account of his death. The quaint style and plain finish of this room, with its large old-fashioned closets, contrast strangely with our modern ideas of luxury. Above this room is the small attic chamber to which Mrs. Washington retired after her husband's death, and in which she herself died. On the second floor we passed through a number of chambers designated the blue, red, green, and yellow rooms, each being finished in its respective color. The blue, now known as the Lafayette room, from having been occupied by the marquis on his visits to Mount Vernon, has been completely refitted and furnished, through the energetic efforts of Mrs. N. M. Halsted, of New Jersey; nearly every article having some Revolutionary

interest. Especially noticeable was a stand, manufactured from the famous Washington tree at Morrisville, Pennsylvania, by W. B. Douglas, of Newark.

The carpet was presented by Mr. Day, and the black-walnut bureau by Mr. Allen, both of New Jersey; while over the mantel was a fine, full-length engraving of Lafayette, presented by Mrs. Lothrop, of New York. Through the attic, by a spiral stairway recently constructed, we ascended to the observatory crowning the roof, and looked out upon the lovely landscape in its graceful sweep of fields, forest, hill, dale, and river. On the north and east the magnificent Potomac spread its broad expanse of bright waters, snowy sails, like great white-winged birds, floating on its surface; while beyond the river the distant shores of Maryland are dimly discerned, and to the south and west a dark line of forest girdles the horizon.

Leaving the house soon afterward, and descending the slope of the hill by a gravelled walk, we passed the old vault from which the remains were removed on the 19th of April, 1831, under the supervision of John A. and Colonel George C. Washington. It is left in its original state, and protected by a substantial paling. In a few moments more we found ourselves standing before the unpretending tomb of the first President. It is a simple structure of red brick, with grated iron doors, bearing above them this brief inscription:

"WITHIN THIS ENCLOSURE REST THE
REMAINS OF
GEORGE WASHINGTON."

Around and above the sacred spot, cedars and other evergreen trees droop their graceful branches in perpetual reverence. Through the doors can be seen the marble sarcophagus in which rest his remains, and near it another, containing those of his wife. Both were decorated with wreaths of flowers.

In front and at the sides of the tomb are four monuments to different members of the family—one handsome shaft in memory of Judge Washington.

Following the winding, romantic path still farther down-hill, we came to the Spring House, and enjoyed a draught of the pure, cool water; then rested a moment on the gnarled roots of an old tree, under the spreading branches of a magnificent oak. The ground was covered with ferns, water-cresses, and green mosses, and dotted with clumps of spring-beauties and forget-me-nots, and other flowers.

Going back to the house, we went around by the out-buildings and well, with its "old oaken bucket;" thence into a broad carriage-drive, extending on either side of a smooth, sloping lawn, cut in the shape of a heraldic shield, with groups of fine old trees scattered around, and extending toward the gate, with the porter's lodge visible in the distance.

On one side of this lawn is a large vegetable-garden, on the other a flower-garden, both ornamented with quaint old box-hedges. There is a handsome green-house, with hot-houses, where rare varieties of grapes are raised under glass. The collection of plants and flowers is fine and varied. Mr. Craig, the superintending gardener, a genial, intelligent Scotchman, most courteously did the honors of this department, presenting us with an exquisite bouquet. Wandering out from the garden toward the gate, your steps are bewildered in a labyrinth of skilfully-arranged winding walks.

The beautiful April day was drawing to its close; a misty veil gathered over the earth as the purple light of sunset faded into pale-roose tints, throwing a softened radiance, like a glory, over the scene. A little spring-bird poured a flood of melodious notes upon the soft evening air, the branches overhead stirring as if with the rustle of angels' wings, ready to bear to heaven's gate that songster's vespers-hymn. As the shadows deepened, the weird charm of moonlight shed its glamour around; there was a spell even in the silence—something to be felt, but beyond the power of language to describe. So closed the day at Mount Vernon.

The early hours of night were spent in social converse, reviewing scenes and incidents of the past, or discussing the future, especially the possible execution of a cherished design of the Ladies' Association in endeavoring to collect and restore to the home of Washington all relics that can be obtained, associated with himself or the house where they once belonged and should most appropriately be placed.

The regent, Miss Cunningham, who has made great personal sacrifices in devotion to this cause, is aided in her efforts by vice-regents in each State, ladies representing some of the most distinguished

families of the country, both in talent, position, name, and blood. Miss Cunningham resides at Mount Vernon, giving her personal attention to the business of the association, aided by the secretary, and supervising the restoration of the house and grounds to their original good order and beauty. Her work is done as a labor of love, as she has positively refused to receive any remuneration for her services.

Between ten and eleven P. M. I retired, the Lafayette room being assigned to me—the first occupant since it was refitted and furnished. Seated before a fire, which the coolness of an early-spring night rendered comfortable, watching grouped figures grow, glow, and die amid the coals, while the picture over the mantel seemed to look down with observant eyes, as if it recognized a daughter of the house, I felt that Longfellow spoke truly, "All houses where men have lived and died are haunted houses." Moved by an impulse powerful yet irresistible, I arose, passed from the room into the dark passage, and entered the apartments beyond. A dim, spectral light from the windows scarcely softened the gloom; no sound broke the brooding silence; but an occasional creak of the floor underfoot, or a profane rat dashing past, startled a host of strange echoing sounds that reverberated in the deep silence of midnight. I stood in the chamber where Washington died. The air seemed thick with mysterious influences, fascinating even in the vague terror of their undefined source. I seemed to feel, though I could not hear, the footfall of invisible companions hovering near; then a rustle of trailing garments seemed sweeping past, and I shivered as a cold breath fanned my cheek, with the moan in it of a stifled sigh. Even the walls had a language of their own, and seemed written over by invisible fingers in words that gleamed out in the darkness, telling strange tales of the olden time—love, sorrow, life, and death, as it had passed there long ago.

In my mind's eye I saw a vision appropriate to the place. The young moon looked in through the windows over a beautiful snow-shrouded winter landscape, lighting a strangely-sad scene. It was the 14th of December, 1799. A fire burned on the hearth, a shaded lamp on the table; and there stood the loving watchers around a bed whereon lay the form of Washington. Dr. Craik, the friend and physician, with head bowed on his hands in grief, stood beside him; Major Lear held pressed to his bosom the hand of the dying hero; and at the foot of the bed sat the devoted wife, in deep yet silent sorrow. Christopher, the old, attached servant, gazed at his kind master tearfully, lovingly; while other servants, with awe-stricken faces, were grouped near the door. The silence is broken by half-whispered words: "I am just going. Have me decently buried, and do not let my body be put into the vault in less than three days after I am dead." The eyes, already glazing in death, look calmly, steadily at the friend who holds his hand, and again there comes a question: "Do you understand me?" A voice choked with emotion whispers, "Yes." Then those last brief words, so full of significance, are spoken: "It is well." He is content; the eyes close on earth; the labored breathing imperceptibly ceases, and there comes a great calm. The spirit has fled from time to eternity, and he whose name in life filled the "climax of story," in death had but passed "from glory to glory."

In a moment the light faded, and again I was enveloped in gloom, and a great black shadow fell like a pall over the scene. The vision passed, the phantasmagoria vanished, and left me standing in an empty, desolate room, the windows looking at me like wide-open, un-winking eyes, reading the secrets of souls. The dim moonlight made darkness visible, as I glided silently back to my chamber.

When thought is awake, sleep does not come at our bidding; and I lay for some time dreamily watching "shadows from the fitful fire-light dance upon the wall," wondering if the spirits of the Revolutionary heroes who had slept there so many long years ago were keeping vigil in the room. At last I slumbered, but awakened with a start to a strange consciousness of a presence near me. The fire had died out, and nothing was visible in the eerie gloom; and yet something seemed to hover in the air above me, and then there was a gentle pressure on my brow and eyes, which seemed a benediction, and under this influence I fell asleep.

The morning sunshine streaming in through the windows roused me, and the spell had passed. I was soon walking up and down on the old piazza, whose tall, white pillars gleamed in the morning light, while dew sparkled on the sloping hill-side, and the river's glittering expanse stretched away as far as the eye could reach, while a passing

steamboat was breaking the tranced silence with the tolling of its bell in honor of the glorious dead.

Night had passed; morning had come; but it was impossible to decide whether in the glamour of moonlight, or the sparkle of spring sunshine, Mount Vernon was most enchanting.

ELLA B. WASHINGTON.

A CITY OF THE DEAD.

"I WILL send my camels to meet you at the Joongshai Station," wrote our friend Bolton, just as you would say in New York. "I will send a hack to meet you at the Hudson River Depot." Bolton was a revenue surveyor in the service of the Indian Government, and he was urging my wife and me to come over and pay him a visit to his camp in the Sinde Desert, and inspect the "Tombs of Tatta"—far-famed monuments of antiquity in the northwestern corner of India. The hot season was just over, and all the government officials, from the "Commissioner Sahib" downward, were off into the interior of the province for their annual tour of inspection. The time for hard work had come, and Bolton, with his train of camels and horses, surveyors, dumpy levels, and theodolites, had "pitched his tents toward the rising of the sun," and was busily employed with the local details of the great system of triangulation, which under English rule had spread over India from the Himalayas to Cape Cormorin.

"It is only fifty miles by rail to Joongshai," said he; "you can run down by the night-mail; be there about two in the morning, and I will send my camels over to meet you. Then it is only eleven miles or so to Tatta, and you will reach my place just in time for breakfast."

I knew all about the Tatta Tombs, but my wife had never seen them; and as she had not been very long in the country, and was foolishly anxious to experience the new sensation of camel-riding, we accepted our friend's invitation and made our preparations for a start. When I say we made our preparations, I mean that we did so by deputy. The "butler," as the head servant in an Indian household is called, was summoned and duly informed of our intentions, which with such a model domestic as Ahmed was all that was necessary. He had made many a tour through the province with his former master, and knew what was wanted far better than we did—he would have scorned to ask for directions if I had told him we were bound on a journey to the moon—so he made his salaam, muttered his customary "Good, my lord," and departed. Nor was our confidence misplaced. Punctually at the appointed time Ahmed had a "gharry" or hack-carriage at the door, packed with every thing needful; down to the bedding, which he knew our friend's bachelor establishment would not be capable of supplying, and the well-appointed basket of provisions for our short night journey by rail.

Two hours swift gliding over the Sinde Desert; the mellow moonlight flooding the desolate landscape, and taking just as much pains to gild and beautify the hideous cactus-bushes, and to cast broad cool shadows on the sides of the dried-up water-courses, as if they had been orange-groves and garden-terraces. To the left a line of bare rocky hills, seemingly interminable; to the right a ghastly, barren plain, with here and there distant clumps of dark woodland, and the faint shimmer of water on the far horizon, which we knew to be on or other of the score of sandy channels through which the classic Indus sneaks uselessly to the sea. It was cool and pleasant enough now, as we leaned out of window to catch the delicious night breeze, but the sun was only biding his time, and in a few short hours those miserable, rocky hills would glow like a furnace, and the desert would bake and parch in the pitiless heat, as it had baked and parched, day after day, through all the long centuries, all those thousands of acres—useless and seemingly God-forsaken, ever since their creator. Only this one little narrow strip of them, over which the iron horse was speeding, was available for man's uses; all the rest, untouched save by Nature's forces, sun-smitten and torrent-scarred, was a vast and howling wilderness.

But the train slackens, and here we are at Joongshai—central station on the hundred and odd miles of railroad which connects the flourishing seaport of Kurrachee with the Indus at Kotree, the lowest point in the delta practicable for steamers. We step out on the platform, leave Ahmed to look after our baggage, and, passing through a door in a mud wall, find ourselves on the moonlit plain, where our

camels are kneeling and uneasily ruminating, poking their long necks out as their manner is, and peering about them with their fretful eyes. Of all aggravating beasts your patient camel is the worst. He will neither fight you determinedly, nor give in resignedly. He submits to your will, but does so with the worst possible grace, querulously remonstrating all the time he is being loaded in harshest gutturals, and with a manner which arouses a lively desire to kick him; but destitute of pluck sufficient to send you and your packages flying, and gallop off into his native desert. Finally, when you are mounted and his driver gives the word, he rises with a final grumble, and, nearly pitching you off in the process, gets himself on his ungainly legs and shambles off with the most awkwardly, detestable gait possessed by any living creature.

However, even camel-riding has its advantages. It is true it makes your loins ache, and the width of the creature's back is too great to bestride with comfort; but you get over the ground quickly enough, become accustomed in time to the unusual swinging motion, and experience a new sensation in sweeping along at such a height above the earth. You are not responsible for the animal or his management, moreover. Your driver, who sits in front of you, takes all that trouble off your hands, and if you feel nervous you can steady yourself by a grip of his waist-belt. About this point, however, there is a drawback. There is no great amount of space on a camel's back, and you are therefore obliged to sit pretty close behind your conductor. Now, of all men, not excepting an African, a genuine Sindee is about the least pleasant to be brought into close proximity with; and I must say we should have found our ride a good deal more agreeable if Bolton had insisted upon his camel-drivers putting on a clean shirt apiece before leaving his encampment.

Our little caravan consisted of two riding and two baggage camels. My wife was mounted on the first—a comfortable sideways seat having been ingeniously contrived for her—I rode the second, Ahmed the third, and the fourth with our baggage and bedding brought up the rear. Our road skirted a low, rocky hill for a mile or so, and then struck out clear across the desert. That ride—the first camel-ride we had either of us experienced—is one of those things which live in one's memory. All was dim, weird, and mysterious—strange contrast to the familiar rattle and shriek of the locomotive we had just quitted. The scattered clumps of scanty vegetation, cactus-bushes, and the like, threw black shadows across the faintly-defined path; the wide, monotonous desert was almost without landmark, melting away in hazy gloom toward the distant horizon; the full, yellow moon, now dropping slowly toward the west, in a violet sky, threw her calm radiance over the landscape, the uncertain, romantic light softening and hiding its deformities; while the camels, with their well-padded hoofs, swung noiselessly onward, and the cool, dry air of the desert quickened our pulses, and heightened our sense of novel enjoyment. Countless cicadas hummed among the bushes; occasionally some wild creature would dash across our path, while the faint wailing of the jackals sounded pleasantly awful in the distance; my wife, one of whose pet weaknesses was a horror of these quadrupeds, comforting herself with the assurance that, in the wildly improbable event of the cowardly beasts approaching us, we were far too high up in the air for them to reach us.

Presently we emerged upon a little open space, where a number of dusky forms were crouched in a circle. Here was a genuine caravan encamped for the night; the baggage and camels in the outer ring, and the drivers in the middle, surrounded by their merchandise—traders from far-off Kandahar or the mountains of Central Asia, with wool or cotton, or perchance rich Cashmere shawls and dried fruits, on their annual trading-visit to the coast—making nearly their last bivouac after their long journey. Recollections of Abraham and Isaac and Jacob, of the Queen of Sheba with her company of camels and attendants, or perchance of the Arabian Nights, crowd upon our minds as we glance in passing at this Eastern picture—the unchanged and unchangeable East, where, generation after generation, and century after century, men are content to tread in the same old paths, securely trusting in the wisdom of their forefathers.

But now the moon was sinking lower and lower in the west, and a faint tinge of color beginning to light up the eastern sky. The ground became more stony, and we were conscious of a slight ascent, which continued a mile or more, and showed me we were approaching our destination; until, just as the sun showed his rim above the horizon, we emerged upon the summit of a range of low-scarped bluffs, and

faint, ghostly forms of domes and pillars, and towering masses of Saracenic architecture came one by one out of the gloom and began to flush rosily in the dawn.

Several years ago, so the story ran, some high government officer, making his official tour through this district, and finding a cool and pleasant camping-ground among the ruined tombs on the summit of these Mukli Hills, which overlook the ancient city of Tatta, conceived the idea of making some permanent erection which would afford shelter for the future to himself and others, and enable him to dispense with the carriage of a tent or two. So he gave orders for a *gonudy*, or native mason, to be summoned, and issued his directions to have a small, two-roomed house, with veranda and other conveniences, built forthwith on an unoccupied space of his selection. But an unexpected difficulty presented itself. Tatta is a decaying place. Once the capital of Lower Sind, and the seat of Mussulman government—a port, moreover, whence, little more than a century ago, vessels of moderate size could make their way through the delta to the ocean—the town is now three miles or more from the capricious river which once washed its walls. All its prosperity is a thing of the past, and it was many a long year since a new house had been built there. So the *gonudy* explained, with many apologies, that he had never built a house, and did not know how to set about one.

"Confound it! What can you build, then?" inquired the official.

"O protector of the poor, thy servant is a builder of tombs!" replied the man of bricks and mortar.

"Oh, you can build tombs, can you? All right. Set to work tomorrow morning and build me a tomb just here; square, mind you, with a dome on the top which will stand a shower of rain."

So, in a few weeks' time, a neat white tomb, with a door at each side and a nicely-vaulted ceiling, stood completed.

"So far so good," said our friend. "That will make a capital dining-room. Now build another tomb, a little smaller, close up against it; and, when that is completed, build a long, narrow tomb, with four archways in the side and one at each end, along the double front."

The *gonudy* went to work again, and it was not long before a tidy little building was completed, with two square rooms—a bedroom and a dining-room—and a cool veranda along the front; and it was at the door of this singular erection that our friend Bolton stood to receive us as we alighted from our camels stiff and tired after our unaccustomed journey.

Baths and breakfast were the first essentials, and, by the time we had risen from table, our great enemy, the sun, was high in the heavens, and we were forced to delay further explorations until the afternoon. So we sauntered about the little encampment, saw how the horses were picketed, and watched the native surveyors at work in the adjoining tents; while Bolton discoursed learnedly of cosines and logarithms, and showed us specimens of the beautiful maps which his department was producing, where almost every pebble was marked down. So, with the assistance of luncheon, the day passed pleasantly enough, until the heat of the sun had somewhat moderated, and we set out to explore the "Tombs."

The range of low, rocky hills upon which we stood lies, as I have said, close behind the decaying city of Tatta, which stands upon a tract of level country stretching from their base to the ever-shifting and turbid Indus. There are evident signs that the river itself once swept around the foot of these hills, but it is said with truth that there is hardly a square mile of the province of Sind over which the Indus has not at one time flowed; and the river has now been for many years working away to the southward, leaving the hills and the city farther and farther from its banks. Tatta is still marked with large capitals upon most maps of India, while Kurrachee, the present capital and seaport, and Hyderabad, its immediate predecessor, are relegated to the obscurity of small print or italics; and Tatta was in its time a place of great importance in trade, and one of the seats of government, moreover, of the *synds*, or viceroys, who in the time of the Mogul emperors ruled over an enormous territory, including the whole of the modern province of Sind and a good slice of the Punjab. They were mighty potentates in their day, the *synds* of Sind, owing a nominal allegiance to the great emperor at Delhi, but, from their distance from the capital, independent sovereigns in all but the name; and, on the flat summit of the bluffs which overhung their city, each built for himself a handsome mausoleum, some

of cut and fretted sandstone, and others of brick covered from dome to basement with the richly-colored encaustic tiles, for the manufacture of which Tatta was at that time celebrated. Where their dead

among whose ruins we were standing. For nearly six miles along the summit of these hills, and from a quarter to half a mile in width, the ground is one vast cemetery. The number of graves, disposed with-

STARTING FOR THE TOMBS.

rulers lay entombed, the common people also desired sepulture; and nothing shows so clearly the departed glory of the place as the enormous extent of ground now covered by the "City of the Dead,"

Although differing widely in proportions, materials, and architecture, the plan of each of these larger tombs is the same. There is, first, a spacious court-yard, enclosed by a massive wall of masonry,

covered with the most intricate arabesque tracery, and entered by a lofty gateway with a Gothic or Saracenic arch. At one side of this court, generally that immediately opposite the gateway, is the *musjid*, or place of prayer, a niche or recess in the wall, distinguished by an overarching stone canopy, or sometimes merely by the superior height of the wall and greater richness in the decoration, and so arranged that the worshipper as he stands before it has his face turned toward Mecca, a position which all Mussulmans are required to assume before commencing their devotions. Upon a raised platform in

ON THE ROAD TO TATTA.

the centre of the court-yard stands the tomb itself. These buildings are all of imposing size, and most of them in a tolerable state of preservation, the English Government devoting a small sum yearly toward keeping them in repair, in which laudable endeavor they are materially assisted by the almost rainless climate of Lower Sinde. Some, as I have said, are of a handsome cream-colored stone, others of brick covered with encaustic tiling; but the designs, although very various, are all very elegant, and show evidence of consummate taste and ability on the part of the builders. The largest and most imposing tomb, which dominates the rest, and forms the most attractive feature in this grand architectural panorama, is distinguished by a white dome of the most graceful outline, supported by a double-storied colonnade of square-carved pillars, forming two covered piazzas extending round the front sides of the building. We were never tired of admiring the elegant outline and proportions of this beautiful structure, every detail of which is finished with the greatest taste, and as if neither time nor money had been spared on its conception and execution. Another, which stood near it, and must have been a perfect gem when new and fresh from the hands of the architect, was covered with encaustic tiles of a rich purple tint, the basement being a pale-yellow, while the dome, of Moorish outline, was a brilliant blue, its polished and enamelled surface flashing brightly in the sun. But it would require a volume and numberless diagrams to do justice to these tasteful buildings, which are the more wonderful when we consider that architecture in India is now a thing of the past, and that the mud-brick, or wattle-and-dab, habitations of the modern Hindoos are only surpassed in ugliness by the utilitarian barracks and bungalows of their Western conquerors. Differing widely in exterior, the internal arrangements of these buildings are nearly the same. The vaulted and tastefully arabesqued interior, faultless in its proportions, is only illuminated by a few small apertures near the roof, generally of pierced stonework, which throw a softened light upon the monuments beneath. These are of oblong form, of carved or pierced stone, or more generally of white marble, and the principal one—

that of the synd himself—is separated from the rest and enclosed within a low stone balustrade resembling a chancel-railing. The resting-places of the male members of his family are ranged in

order outside the railing, varying in size down to little baby-graves of a couple of feet in length; but the smallest "man-child" has a place inside the great tomb itself, while his mother and sisters are condemned to sleep in the court-yard, or in some cases in a separate erection at a safe distance from their lords and masters. Even in death the Mussulman idea of the inferiority of woman finds fitting expression.

From the parapets of the larger tombs there are fine views to be obtained over the surrounding country. The bluffs mark the edge of the desert, and the limits of the annual river inundations, so that on one side all is barrenness and desolation, on the other wide-stretching and fertile plains, extending to the horizon, covered with rich vegetation and belts of woodland, with here and there a glimpse of the great river shining in the sun. The white houses and huge mosque of Tatta, built by the Emperor Jehanghir, peep out among date-palms and clumps of mango and banyan-trees;

while along the summit of the ridge to right and left, stretch as far as the eye can reach, the bramble-covered streets and decaying buildings of the silent city. Coarse vegetation is choking up the stately archways; prickly shrubs and cactuses forcing their way through the chinks of the mouldering masonry; the lizard and cobra capella glide noiselessly from stone to stone, and no sound breaks the intense stillness, but the drowsy hum of the hornet-wasps, who find a

THE PRINCIPAL TOMB.

THE TOMBS OF TATTA.

safe asylum in the cornices and fretwork over the heads of the departed princes.

The bones of one white man, and one only—an Englishman—are interred in this vast cemetery. The plain flat stone, with a quaint inscription, looks strange enough in the midst of this countless multitude of Mohammedan graves; but the man's tomb is emblematic of his life. As he had died, so had he lived; a lonely exile among thousands of enemies, hated and yet feared, the pioneer of English dominion in this corner of India. His name was Cooke, and he was the humble agent, a hundred years ago, of the then infant East India Company, at the great commercial *entrepôt* of Tatta. His house is still shown in the city, uninhabited and falling to decay; and here he lived his solitary life; graciously permitted by the representative of the Great Mogul to traffic with the true believers, and collect cargoes of silks and muslins, and other Indian products, for the little vessel which was dispatched every year from Bombay to receive them. His life, as appears from contemporaneous records, was exposed to constant danger, but he carried an Englishman's stout heart through it all, and died at last from natural causes. He was but twenty-seven, and his faithful native servant—his only friend—closed his master's eyes, and, as the inscription reads, buried him here, and built his tomb.

Close under the brow of the hill on the south stands a small collection of buildings, forming a resting-place for Hindoo pilgrims; one of the regular stages on the great line of pilgrimage to the celebrated shrine of Hinglaj, on the Belooch coast, some hundreds of miles west of Kurrachee. The worn and haggard devotees were continually arriving at and departing from this little caravansary; some returning homeward from their long and toilsome journey, radiant with the hopes of immortality so hardly won—others bound for Kurrachee, where there is another resting-place, the last before entering on the horrors of the Belooch coast, where there is neither food nor water, and which is whitened with the bones of the poor fanatics. They swept past us one evening, some fifty or more, as we were playing a game of croquet on a little piece of bare ground which our host had had prepared with infinite difficulty; and with his Sikh servant (an old soldier of Runjeet Singh's) for a fourth partner; and it seemed to me that, among all the strange places and circumstances in which I had taken a part in this popular game, surely none were so strange and incongruous as this. Our company was queer enough. The old "butler" with his long white beard parted in the middle, and tucked up over each ear to keep it out of his way, had crossed bayonets in his time with English troops in the Punjab, and now, with the deftness and adaptability of his race, he had learned to knock the colored balls about, to please a whim of his master's, with as much skill as he had formerly displayed with matchlock and tulwar. Close at hand was the solitary tomb I have described, with the date, which showed how brief was the interval of time since this pioneer, holding his life in his hand, was the sole representative of his race in a province now ruled by Englishmen, and traversed by English railroads and steamboats. All around us rose the stately but mouldering relics of our predecessors in the Government of India; their silent tenants all unconscious of the pollution of the Western unbelievers, who had not been ashamed to drink wine and eat pork over the bones of the followers of the Prophet. But if the dead Mussulmans were heedless of our presence, and recked not of our hoops and mallets, hardly less so were the careworn pilgrims—devotees of a superstition which was old when Mohammedanism was in its infancy; who, ragged and nearly naked, their strange, wild figures relieved against the glow of the western sky, and chanting in a mournful cadence, "Hing-laj—Hing-laj," filed grimly before us with eyes directed straight before them, burning with religious zeal, and having no place in their thoughts for such idle triflers as we. They had parted with all they possessed—left houses and lands, and wives and children, some of them weeks, some many weary months before—from every corner of the great peninsula had they come, begging their way and subsisting upon alms, suffering hunger and enduring thirst—hardship of every kind patiently endured with the certainty of worse before them, but filled with a great enthusiasm, their faith and its obligations the one thing needful, all else as dross. They were low idolaters, it is true, about whose ugly idols and vile superstition we can all read in missionary books; but at least they believed in their religion, bad as it was, and, being assured that pilgrimage with its countless miseries would win them immortality, counted the cost, and were willing to pay the price like men—can we say like Christians?

SAINT-CLOUD AS IT WAS AND IS.

FEW visiting Paris have failed to describe the segment of a circle between the Saint-Lazare Station and Saint-Cloud; nor will they forget the lovely scenes through which they passed. Asnières, with its bridges over the Seine; Courbevoie, Puteaux, and Suresnes, with their villas and vine-clad slopes. The Bois de Boulogne, the winding river with Paris in the background, the Arc de Triomphe standing like a giant even among the lofty houses by which it is surrounded. On the right and immediately before you reach Saint-Cloud, stands Mont Valérien, the strongest of all the strong fortresses by which Paris is defended, ready to pour death and destruction upon any point within three or four miles of its summit. During the late war it guarded effectually all that deep and fertile valley of the Seine lying between it and Paris. The route just described we have seen under all aspects, covered with the snows of winter, budding forth and blossoming in spring, basking in midsummer heat, and yielding its rich produce in autumn. But never did we pass along this route with deeper and more painful interest than yesterday. War, that unmitigated curse of nations, has desolated this lovely region. The once beautiful bridge of Asnières is a ruin; many of the houses and villas pillaged; doors, shutters, and railings, torn off and burned; the trees cut down, and gardens destroyed! All this by the French themselves (chiefly by the "Frances-Tireurs"), who robbed and plundered the country-houses around Paris. In the ambulances wounded Frenchmen were brought in, their knapsacks filled with articles they had pillaged from their own countrymen.

We reached Mont Valérien early, and were most anxious to see its present state. The Prussians had vacated it only the day before, for it was one of the forts subdued, not by Prussian guns, but by famine. Armed with a French "laisser-passer," and a private letter from one in authority, after some difficulty we gained admittance. The first thing meeting the eye was a large gun tossed over the ramparts, its muzzle blown off! We then passed all round this dismantled fortress. Its monster guns, if not taken away, left a ruin; the carriages and cranes broken up, the shells burst, the guns with their muzzles blown off. One monster gun looked sound, but, when we came to examine it, a deep crack of from two to three feet from the muzzle, showed it was as useless as an exploded shell. Never was a fortress more thoroughly dismantled and stripped than Mont Valérien, the once impregnable stronghold of Paris! One could not but pity the French soldiers as they were gathering up the refuse and ruins left by their hated enemy. Six minutes from Suresnes brought us to Saint-Cloud. Here, indeed, was the track of war, without any mistake. Who can describe the utter desolation of this once flourishing and favored town! Not one of its lovely villas seems to have escaped. Its streets are a continued ruin.

Standing between two fires, the French and German, it has had no chance of escape. The night before the armistice saw the last of its houses and villas burned to the ground. Poor, beautiful Saint-Cloud! What a melancholy sight! The entire town in ashes! The skeletons only of the houses remaining. There one saw portions of charred furniture standing on bits of flooring near the walls. In one house *au troisième*, in an alcove stood a bed half-overturned, the clothes still lying on it. A *buffet* in a corner standing on three legs, one leg in the air over our heads; the floors, having all given way, were lying in ashes at our feet. In another, a kitchen *au second*, the little *four économique* perched on a charred beam; the saucepan on the stove, with a plate over it, a *bouillotte*, and an earthen pan called a *marmite*, the dinner evidently in preparation when the inhabitants had to flee. In another house *au troisième*, a chimney-piece standing against the wall; the Sèvres ornaments and clock untouched. In another, clothes hanging on pegs high in the air, waving about in the wind. In another, pictures and photographs hanging on tottering walls where no hand could ever reach them again. Every now and then a crash was heard, a portion of a house or furniture which could no longer hold on in its tottering position. The poor owners were in tears, grubbing about to pick up any valuables. One poor lady and her daughter came away weeping, having found only *one* dessert-plate! the remnant of a splendid set which must have cost hundreds if not thousands of francs. It spoke too plainly of luxury gone by, for the poor lady said, "We are utterly ruined!" There were lovely gardens trampled over, cut up to make trenches. Trees—noble trees—half-sawed through, had been left standing to conceal the batteries the Germans

were constructing behind them; and in the last *grande sortie*, at a given signal down came an avenue of tall old trees, unmasking these fiery batteries, which poured in death and destruction. This so completely took the French aback that they never rallied again. Leaving the ruined streets and houses, we next visited the once splendid Palace of Saint-Cloud. Designed by Mansard, it was originally built by Jérôme de Goudy, in 1568. Louis XIV. bought it and presented it to his brother, the Duc d'Orleans, who spent an enormous sum in improving and adorning it. It has been the scene of great events. Here Napoleon I. laid the foundation of his power, expelling with his armed grenadiers the Council of Five Hundred, who were holding their sittings in the Orangerie. Here Charles X. signed the fatal ordinances which caused the Revolution of 1830, and lost him his throne. Here Henry III. was assassinated. Here Queen Victoria was received and entertained by the emperor, in 1855. Here was the favorite residence of Marie Antoinette, Napoleon I., as well as of the late emperor. Well, what remains now of this historic and once splendid palace? Alas! it is one heap of charred ruins! Marble pillars and statues turned to lime; bricks, iron railings, and window-bolts, sofa-springs and sofas, tiles and chimney-pieces, remnants of furniture and curtain-ropes, all lay together among masses of stone and mortar. The *Galerie d'Apollon*, with its exquisitely-painted ceiling; the *Salon de Vénus*, with its beautiful specimen of the Gobelins tapestry; the *Salon de Minerve*, where so lately the emperor received a deputation headed by Lord Shaftesbury, who presented him with a splendidly-bound Bible, in acknowledgment of the liberty granted for evangelistic labors during the Exhibition; the *Salon Vernet*, containing eight of Horace Vernet's best paintings; the private apartments of the emperor and empress, once occupied by Marie Antoinette, the Empress Josephine, Maria Louisa, the Duchess of Berri, and Queen Henrietta of England, as well as Queen Victoria; the *Escalier d'Honneur*, with the large picture by Müller, commemorating the visit of the latter, and containing the figures of the queen and Prince Albert, the emperor and empress, and Lord Clarendon—all, all gone forever, a few blackened walls the only monument of departed grandeur! It made one's flesh creep to hear the creaking of some shutters as they swung backward and forward on their hinges, and mournfully told the tale of ruin. I saw the doorway through which Louis Philippe fled, and remembered the *gardien*, as he was called, telling us, poor old man, how many sovereigns he had helped to escape, and with a laugh and shrug of the shoulders he added, he was ready to help others when their turn came! One man pointed out the place where Queen Victoria's portrait used to hang, and said: "Ah, you are happier in your country than we in ours. Never let your country follow our example; we are too much given to change, we are never satisfied, and you see what it brings upon us." Immediately in the rear of the palace are flower-gardens, and avenues of chestnut, lime, and elm trees, with ornamental statues and vases, cascades with dolphin shell-work, etc. I observed rows of orange-trees as they had been left in autumn, and now quite dead and withered from the severe frosts of last winter. Most of the statues were more or less broken—some without arms, noses, or legs—Apollos without lyres, and satyrs without pipes. Wherever it could be knocked off, a piece had gone to ornament a German chimney-piece. One could not but mourn over the wilful and wanton destruction of so many beautiful statues. Many of the trees were cut down to make barricades, others bore the marks of shell and shot—not German, but French, for with suicidal hand the latter had destroyed this noble palace early in the siege, lest the Germans should be sheltered by it. In one of the gardens was the prince imperial's play-ground, and his little railway, on which was still seen *Chemin du Fer de Prince Impérial*. The little station was broken, and some of the rails torn up. There was also his *gymnase* and *trapez*, and hard by, a green grave covered with new moss, and with two crosses, on one of which was written, "Andreas Nowak, Fourth Company, Thirty-eighth Regiment." Poor Andreas, how long shall your body rest in this once royal but desolated garden? Two respectably-dressed Frenchwomen and a man stood gazing at it, and the tears filling their eyes. One said, "Poor man! he would rather have died at home. These Prussians are almost all fathers of families; they are a brave set of men, but it is the fault of the rulers." Yes, this was a voice from the deep heart of humanity, and reminds us of the wounded French soldier lying under the tree at Sedan, with some wounded Germans, and who asked, "Are these Germans Christians?" "Yes," he was answered. "Then," said he, "why are we killing each other?" The desolated regions we have just passed

through, the wrecked and pillaged houses, the ruined palace, the broken and bleeding hearts, the mangled bodies which earth scarcely covers in many a battle-field, all make the war-track hideous, and should create a longing for that time when "the nations shall learn war no more;" when the sun shall no longer light armies to battle, or the earth be scarred with graves; but *peace*, the smile of Heaven, the calm of earth, shall be as universal as the dominion of Him who is its prince.

EDWARD FORBES.

KNOCKED ABOUT.

WHY don't I work? Well, sir, will you,
Right here on the spot, give me suthin' to do?
Work! Why, sir, I don't want no more
'N a chance in any man's shop or store;
That's what I'm lookin' for every day,
But thar ain't no jobs; well, what d'y'e say?
Hain't got nothin' at present! Just so;
That's how it always is, I know!

Fellows like me ain't wanted much;
Folks are gen'rally jubus of such;
Thinks they ain't the right sort o' stuff—
Blest if it isn't a kind o' rough
On a man to have folks hintin' belief
That he ain't to be trusted more'n a thief,
When p'raps his fingers are cleaner far
'N them o' the chaps that talk so are!

Got a look o' the sea? Well, I 'xpect that's so;
Had a hankerin' that way some years ago,
And run off; I shipped in a whaler fust,
And got cast away; but that warn't the wust;
Took fire, sir, next time, we did, and—well,
We blazed up till every thing standin' fell,
And then me and Tom—my mate—and some more,
Got off, with a notion of goin' ashore.

But thar warn't no shore to see round thar,
So we drifted and drifted everywhar
For a week, and then all but Tom and me
Was food for the sharks or down in the sea.
But we prayed—me and Tom—the best we could,
For a sail. It come, and at last we stood
On old arth once more, and the captain told
Us we was ashore in the land of gold.

Gold! We didn't get much. But we struck
For the mines, of course, and tried our luck.
'Twarn't bad at the start, but things went wrong
Pooty soon, for one night thar come along,
While we was asleep, some red-skin chaps,
And they made things lively round thar—perhaps!
Anyhow, we left mighty quick—Tom and me,
And we didn't go back—kind o' risky, yes see!

By'm-by, sir, the war come on, and then
We 'listed. Poor Tom! I was nigh him when
It all happened. He looked up and sez, sez he,
"Bill, it's come to partin' 'twixt you and me,
Old chap. I hain't much to leave—here, this knife—
Stand to your colors, Bill, while you have life!"
That was all.—Yes, got wounded myself, sir, here,
And—I'm pensioned on water and air a year!

It ain't much to thank for that I'm alive,
Knockin' about like this—what, a fire!
That's suthin' han'some, now, that is. I'm blest
If things don't quite frequent turn out for the best
Arter all! A V! Hi! Luck! It's far more!
Mister, I kind o' liked the looks o' your store.
You're a trump, sir, a reg—eh? Oh, all right!
I'm off, but you are, sir, a trump, honor bright!

DANIEL CONNOLLY.

A SPANISH OLD-CLOTHES DEALER.

FROM A PAINTING BY WORMS.

O X F O R D .

OXFORD is about sixty miles northwest from London, and situated in one of the finest sections of England. It is a city of colleges, of which there are nineteen, each separately endowed, but all united under one university organization. For a city of thirty thousand inhabitants, the architectural display is probably unrivalled in the world. The college edifices are upon a scale of great magnificence; are located in different parts of the city, but quite near to each other, and are brought into easy connection by broad, well-paved, and cleanly-kept streets. This is the more remarkable, as Oxford was one of the principal towns of England as early as the ninth century, and was a walled city as late as the seventeenth, after most of the colleges were founded. The principal streets are irregular in width and slightly winding, but without detracting sensibly from their artistic appearance as public avenues. High Street has been often complimented as one of the finest streets in Europe. The college edifices are necessarily the principal feature of the place. They are all constructed of a light cream-colored freestone, so soft in composition that it is sawn with a cross-cut saw without sand or water, and can be cut with little labor into the most delicate ornaments and sculptures. This explains the unusual amount of decorative work displayed in all these edifices. Time has dealt severely with these structures, from the tendency of the external masonry to rapid disintegration. The old walls are now a dingy brown; their surfaces blistered and pitted with unsightly cavities; the mouldings, canopied niches, figure-heads, and statues, are more or less crumbled and mutilated. Nevertheless, the edifices are still grand and sound at heart; the work of restoration goes on apace; entire sections of walls are refaced in strict accordance with the original designs, so that, while old, they are yet new—while decaying, they are constantly rejuvenated. A little familiarity with these characteristics modifies the first impression produced by such conspicuous signs of decay. Hereafter, they will probably improve in external appearance with each and every year. These college edifices by their magnitude and expensive decorations testify to the interest of the English people in higher education, and their desire to maintain their mental and moral life at the highest attainable point. The two Universities of Oxford and Cambridge, about equal in influence and position, have trained the master-minds of the Anglo-Saxon race. By unity of organization and concentration of instrumentalities carried forward through centuries, the two universities have achieved reputations scarcely paralleled in human history.

The college accommodations are on a grand scale, much in advance of any thing in our country. In fact, each college is organized so heavily for the care of its affairs, that its management must be burdensome. If Christ-Church College, the largest and wealthiest here, is taken in illustration, it would seem that their accommodations were in excess of the reasonable wants of sixty Fellows, and some two hundred and forty students. This college was founded by Cardinal Wolsey, in 1525, and was partly constructed before this remarkable man came to grief, as we say, as a politician. It was refounded by Henry VIII., in 1544, with a cathedral church injected into its organization. "The royal foundation was to consist of a bishop, dean, eight canons, eight minor canons, a gospeller, an epistoler, eight lay-clerks, or singing-men, a master of the choristers, an organist, eight choristers, sixty scholars, or students, a school-master, an usher, and forty children. The last were changed to forty students by Queen Mary." As founded, it still remains. The sixty students are now sixty Fellows, who draw their annual stipend from the income of the endowments; the forty students are undergraduates who, for proficiency in their preparatory studies, receive scholarships when admitted to the college, which pay a part of their expenses while students. The eight canons and the eight minor canons, together with the other beneficiaries named, have been perpetuated to the present time, and are now accommodated in the college edifices and supported by its revenues, although it is difficult to perceive their necessary connection with university education. Besides these, there are now two hundred students in this college, who are students in our sense of the term. Before making this digression, I was speaking of the amplitude of the college accommodations, which I will now proceed to illustrate.

This college has three complete quadrangles, and a fourth partly complete, requiring some twelve distinct buildings, with all but one united in their masonry at the angles of the enclosed courts. The

front building is on Aldate's Street, and four hundred feet in length. Passing through an arched gateway under the central tower, you enter the first quadrangle, which is two hundred and sixty-three feet square. On the back side is the building occupied by the canons of the cathedral; on the right, and occupying a part of the right side of the quadrangle, is the dining-hall, which will be again referred to. Crossing the court, and passing through an arched way at the left corner, you enter the second court, about one hundred and seventy-five feet square, which is surrounded by four massive buildings united at the four angles. Turning out of this court at the right-hand corner, and passing through another arched passage, you enter the third court, which is a small one about a hundred feet square, formed by four buildings, as in the other cases. One would suppose the three quadrangles would afford ample accommodations for the three hundred named, as well as the sixteen canons; but it seems to be otherwise, for, on the right side of the rear of the dining-hall, and fronting the great meadow or park of this college is a new edifice recently completed, about two hundred feet long, and architecturally the finest building in the series. It is detached except at one of the rear angles; but there are one or two small structures back of it, and lying between it and the Oxford Cathedral, which last is back of the first quadrangle before described. Cardinal Wolsey took down part of the nave of this cathedral, to make room for the first quadrangle.

The "chum system" does not obtain in the English universities. Each student has separate apartments in the college, where he is required to reside, consisting of a study-room of good size and a sleeping-room. In the newer college structures a third room is added as a pantry or store-room. Students breakfast and lunch in their own rooms, and dine together in the college-hall. Under these halls are ample kitchen arrangements, and the dinner is provided by cooks under a regular contract system, with a prescribed bill of fare.

There are two features in Oxford and Cambridge college architecture so conspicuous, that it would be difficult to say which held the first place—one is the dining-hall, and the other the chapel. They are so much alike externally—both having church windows with stained glass, that one may easily be mistaken for the other. The stately dining-hall of Christ-Church College is one hundred and fifteen feet long, forty feet wide, and the ceiling sixty feet high. The oak-timber roof is regarded as a masterpiece. Its walls are decorated with portraits and marble busts of distinguished graduates. This hall is approached by a grand staircase, constructed as an antechamber, forty feet square, commencing on the level of the quadrangle, and rising to the second story, in which the dining-hall is placed. Its groined, stone ceiling is supported by a single clustered column in the centre of the square, by which it is divided into four equal square sections; and, being decorated with shell-work tracery in the style of Henry VII. Chapel at Westminster Abbey, it is probably the finest staircase in England. The Fellows have their table upon a dais, or platform, across the upper end of the hall, raised about six inches above the floor, while the students' tables are arranged lengthwise with the hall, upon the common floor. And this leads me to observe that there are two grades of students in the English universities: first the "fellow commoners," and second the "commoners," of whom the first sit at the Fellows' table and pay a higher rate, and the second at the common table and fare less sumptuously. The titled gentlemen are expected to enter as fellow-commoners, and the untitled as commoners, although either course is free to all. The English are so wedded to class distinctions, that they seem to have lost all sense of the degradation they imply. They cannot, as students in college, sit down to dinner in the same hall, without a higher seat and a better table for a portion of their number. Turning, in this case, upon the vulgar consideration of more or less money paid, the absurdity is glaring; but so overshadowing is the law of caste in this country, that I presume an untitled gentleman would not presume to enter himself as a fellow-commoner, lest by seating himself so near the sprigs of the aristocracy he should sicken and die at the Fellows' table, from the overaction of his nervous system.

Each college has its chapel, with its dean, organist, chorister, and, in some cases, its choir of men and boys for a full choral service. These chapels are large, elaborately finished, and expensively decorated. That of King's College, Cambridge, is more than equal to the choir of the finest of the English cathedrals. It is simply a grand choir without side-aisles, divided by a screen in oak, elaborately carved and surmounted by an organ, into a chapel and ante-chapel. The

interior is three hundred feet long and forty-five feet wide, without a column; and the ceiling, which is arched, vaulted with stone elaborately decorated with fan or shell tracery, is seventy-eight feet high. Next to the Royal Chapel at Windsor, it is regarded as the finest in England. Although King's College has now but sixty students, this magnificent chapel, with its dean, clerk, organist, chorister, and choir of thirty men and boys, is maintained on the college revenues for the daily chapel exercises of these students. The Sunday services, however, are open to strangers and citizens. The new chapel of St. John's College, Cambridge, is a full-sized church, and a gem in Gothic architecture. It is finished so superbly, both in its interior and exterior, that it could not have cost less than two hundred and thirty thousand dollars, while King's College Chapel could not be reproduced, I should think, for less than half a million. These chapels are for the daily morning and evening religious exercises of the students of the respective colleges of which they form a part. At Oxford, the chapels are not as large, but they are equally fine in their details and in architectural design. Here the original idea is better preserved. They consist, the rest of them, of a choir and transepts. These colleges were designed originally quite as much as seminaries for priests as for the education of laymen. The Church then controlled education, and intended to use it to increase its power; hence the ample provision made for religious worship within their walls. In church architecture, as the nave was for the people, and the choir for the priests and neophytes, the latter part only was reproduced in these chapels, with the transept as an ante-chapel. The choir was stalled, or seated lengthwise, with a canopied seat at the lower end for the dean, and another for the master of the college on the opposite side, while the altar stood at the east end. A brass lectern for the reader, and an organ usually placed upon the screen which separated the choir from the transept, completed the furniture. The four finest chapels at Oxford are Exeter, New College (St. Mary's), Magdalen, and Morton. The other chapels are fine, each having particular merits, as too great a difference might discredit other colleges; but those named are extremely beautiful.

The endowments of these colleges, as is well known, are large. Magdalen has a net income of thirty thousand pounds per annum. There are two or three colleges with still larger incomes. The aggregate of all the incomes of the several colleges at Oxford is stated at two hundred thousand pounds per annum, available for educational purposes; and the present number of students, at thirteen hundred. Since 1852 the colleges have been open to Dissenters. Strange, that the date of this act of common justice should have been so recent! For the last three years they have been open to all such persons as chose to study particular branches without going through the entire course. These persons, who number about seventy, are called "unattached students," and enjoy all the educational advantages of the university. There are thirty-eight professors named in the calendar. These are not attached to particular colleges, but belong to the general university organization. There are also some three hundred Fellows attached to the several colleges, each having a definite number, for whose support provision was made by the founder.

It would be natural to suppose that the million dollars of annual income would cheapen education at the several colleges of this university; that it would make tuition and room-rent substantially free; or, at least, free to the poorer class of students; but it does not seem to take this direction. It is expended upon the salaries of the professors, the stipends of the Fellows, the repair and improvement of the college edifices, and in maintaining the large body of officials connected with each of these establishments. There can be no doubt that it is all devoted without reserve to educational purposes. The students pay room-rent, and pay also for board and tuition, which at the minimum amounts to eighty pounds a year. This does not include the pay of the private tutor, which is at the rate of ten pounds per term for three terms, and twenty pounds more for the vacation, if the student remained to study. A private tutor, under the English university system, is considered indispensable. The college expenses, therefore, may be stated at one hundred and ten pounds as the minimum, which is not largely above the minimum in American colleges. This, of course, does not include clothing, travelling or incidental expenses, nor the expenses of the five months' vacation.

The English university system of instruction is different from our own. It presupposes that the student has passed through the drill-period; or, in other words, has passed through a good share of the

curriculum in our college course in preparatory schools. It is a system of lecturing and of examinations; it deals with the philosophy of literature and language, of science and of art; with criticism, and with practical applications of knowledge. This work is done by the professors and the college tutors, while the efficient teacher and aid of the student is the private tutor, who expounds the difficult passages and problems in the prescribed studies for the term, and who thus endeavors to prepare his pupil for the examination on written questions which awaits him at the end of the term, and more especially at the end of his college course. Eighteen, I understand, is the average age of students entering this university.

We know that Oxford and Cambridge have made famous scholars. The reason must be sought in the English preparatory schools, and in the advanced system of the universities. There is, however, one element tending to stimulate the industry of students which is unknown in American colleges, namely, the prizes in the Fellowships, which are given to the students who attain to the highest excellence in scholarship. These Fellowships secure to the successful student at once an annual income ranging from two hundred to eight hundred pounds for life, with entire freedom to devote himself to any pursuit he pleases, and with no duty to perform to the university. He holds his Fellowship and enjoys its income so long as he remains unmarried. This is the main reliance of the system to insure diligence and industry. It has undoubtedly made many fine scholars; not only those who won the prizes, but an equal or larger number who ran the race and came short of victory. Strange to say, the precise reform now most spoken of, with respect to the two universities, is the abolition of the Fellowships, on the ground that they absorb so large a proportion of the incomes of the several colleges without any corresponding return.

LEWIS H. MORGAN.

DIAMONDS.

THERE is no longer any doubt that South Africa produces genuine diamonds. Chemical analysis in England has settled the question. Custom-house returns show them to be largely in demand. The Dean of Grahamstown writes to the *London Times* that there is room in the diamond-fields to furnish remunerative labor to the whole population of the great metropolis. Professor Gill, of Graaf-Reinet College, admits in a letter to the same paper that the stones are of pure quality, the territory over which they are obtained almost illimitable, and their abundance very great. The rush of emigrants to the fields is not unlike old California days. One canvas city of sixteen thousand souls has sprung up at Klipdrift. Another at Pucil counts twelve thousand. All along the river Vaal, from Hebron to Gong-gong, for a width of five hundred yards, are scattered canteens and shops, huts and tents, wagon-stations and gambling-hovels. The colony is almost depopulated. Every ship arriving is filled with passengers bound for the mines. African climate, personal risk, hard work, rough fare, and improvised accommodations, are no hinderances where gain is as certain as it seems to be. Stage-coaches cross the Karoo Desert in nine days. The traveller is landed in the very midst of a Golconda. Food there is not, nor shelter, nor tools. There are only diamonds. It is no exaggeration. Time, of course, will make this all right. But at Christmas of 1870, over so much of these vast diamond-fields as had been explored, there was only the old Australian gold-diggings' story of lawlessness and avarice, starvation and wealth, desperation and boundless satisfaction, selfish greed and barbarian plunder. The stones are small, rarely above three-fourths of a carat in weight, but of pure water and in great abundance. Some of considerable size, as large as eight and nine carats, have been purchased of the natives in the interior and extracted from the mud-walls of their cabins, but, as water is almost a necessity for successful diamond-seeking, no effort to mine has been attempted at any considerable distance from the river.

The reader knows, of course, that the diamond is the most highly-valued of precious stones and the hardest of all known substances. It is pure carbon crystallized, commonly colorless, in which state it is most costly; it sometimes, from some intermixture, assumes certain hues, as green or yellow, brown or orange, red, blue, or black. As the estimate in which it is held is due as much to its brilliancy as to its rarity, the diamond which has no tint whatever has always been held at a disproportionately high price.

The art of cutting diamonds, though long practised in India and China, was not known in Europe before the fifteenth century. It was a vast improvement. The old setting was rough and dull, with an uneven surface, for, though the primary form of the diamond is octahedron, and is sometimes perfectly crystallized, it is more often irregular, and appearing as rolled grains. Golconda, Malacca, Borneo, Brazil, the Ural Mountains, and Central America, have hitherto been the main sources from which diamonds have been obtained. Brazil exports about twenty-five thousand carats per annum. The stones, however, are mostly small—so much so, that the slave who finds a diamond weighing seventeen carats is at once set free.

Diamonds are cut into various forms, but principally into brilliants and rose-diamonds. The former style is the more expensive and difficult, and it is also that which best brings out the beauty of the stone. It has an upper or principal octagonal face surrounded with many facets. Other things being equal, the greater the number of facets the greater is the value of the diamond. Lapidaries in Delhi, perhaps the most skilful in the world, sometimes multiply facets to hide defects.

The rose-diamond has a flat base, above which are two rows of triangular facets, the six uppermost uniting in a point. This diamond is made of those stones which are too broad in proportion to their depth to be cut as brilliants. Stones still thinner are cut as table-diamonds.

There is no certain rule by which to ascertain the value of diamonds whose weight is two carats and more. So much depends upon color and freedom from specks—upon shape and smoothness—upon brilliancy and transparency—upon perfectness of cutting and capability of setting—that each stone possesses what may be called an idiosyncrasy, and requires to be judged by itself. Small diamonds used by glaziers, watchmakers, and engravers, have a fixed value. The old rule for measuring the worth of all diamonds—now out of use—was to square the number of carats the diamond weighs, and then multiply by the price of a single carat. For example, when the single carat is worth ten dollars, a stone's value, if it weighed twelve carats, would be ascertained as follows: $12 \times 12 \times 10 = \$1,440$.

What the effect of the probable influx of African diamonds may have upon their commercial value it is impossible to foresee. Gold bears the same value it did five-and-twenty years ago, before California and Australia were known as gold-producing countries. The vast yield of the Sierra-Nevada mines has not diminished the value nor lessened the cost of silver. The demand for both keeps pace in advance of supply. This will probably prove true of diamonds. Their use is spreading all over the world. They enter every year more largely into the arts. Nothing is ever likely to take their place as a favorite ornament. Within the last twenty years—so much have they been in request—their value has more than doubled. In fact, the market supply has come almost as much from old Spanish, French, and Italian family-jewels as from the mines.

Among the famous diamonds in the world, until more shall be known of it, is the uncut stone in the crown of the Emperor of Brazil. No other compares with it in size. Lacking purity of water, perfection of shape, advantage of setting, and brilliancy of reflecting light, it nevertheless holds its place as the foremost of jewels by the extraordinary weight of sixteen hundred and eighty carats. Its history is unknown. The persistent refusal with which all proposals to have it cut have been met have led to the suggestion that it is nothing more than a colorless topaz. There is no other reason, however, to doubt its authenticity. If it be, as is probable, a genuine diamond obtained from the old Incas, and jealously guarded from theft because of its extraordinary value—weighing in the rough nearly eight hundred carats more than any other in the world—it deservedly holds its place as the most wonderful precious stone ever mined.

The Rajah of Mattan possesses a diamond, cut as a brilliant in the most perfect style of Eastern lapidaries, that weighs three hundred and sixty-seven carats. There is an indented hollow in its upper end, and it is egg-shaped. But its unequalled transparency, the regularity of its facets, its perfect shape, the broad octagonal face it presents, and the splendor with which it reflects the prismatic rays when flooded with light, make it, perhaps, the finest diamond in the world. The East-India Company, it is said, offered for it a frigate and one hundred thousand pounds sterling once; but the offer was rejected, more perhaps from the extraordinary virtues of healing diseases by its touch attributed to it by the Hindoos than from its intrinsic value, however great.

The Koh-i-noor diamond is well known. It has an authentic history that reaches back of the Christian era. Following in the train of conquerors for more than two thousand years, the emblem of power and pride of sovereigns, worn by barbaric princes on a hundred battle-fields, and exhibited as a trophy of success by scores of imperial warriors, it has come at last to be the priceless jewel in the regalia of England. When the writer saw it first, now twenty years ago, it was in its rough state, weighing nine hundred carats. In shape like the egg of a bantam-fowl, colorless, irregular, without regular facets, uncut, devoid of brilliancy, and inelegantly set, it was at the farthest possible remove from a thing of beauty. No quartz-crystal, or Parisian paste, or so-called Alaska diamond, could have been more dull of lustre. It has since been cut at Amsterdam, and reduced more than two-thirds its size. In all that makes the diamond choicest of precious stones—in shape, regularity, transparent body, dazzling reflection, and capability of incomparable lustre in setting—the Koh-i-noor has returned from the Dutch lapidaries greatly improved, even though it weighs now but two hundred and seventy-nine carats.

The Orloff diamond, in the crown of the Czar of Russia, was found by the Slavonic conquerors of Northern Persia nearly one hundred years ago in a temple of the worshippers of the sun. The cutting resembles that of Chinese lapidaries. For brilliancy, shape, and perfect octagonal form, it has no known rival. Its weight is one hundred and ninety-five carats.

The Prussian crown rejoices in the possession of the "Pitt diamond," weighing one hundred and thirty-six carats, which adorned the sword of Napoleon at the battle of Waterloo. It is of the first water, pure, faultless in shape, and cost the French emperor one hundred and thirty thousand pounds.

The Sanci diamond, owned by a Russian nobleman, has a curious history. Charles the Bold wore it in his cap at the battle of Nancy. A Swiss soldier found it on the field. For one hundred thousand francs it was purchased by the King of Portugal. Pledged to Henry III. of France, it was swallowed by the bearer when attacked by robbers. Recovered from his dead body, it came into possession of Louis XIV. Stolen from the French crown-jewels, after various wanderings it found its way to the North, and was purchased by its present owner for eighty thousand pounds. Its weight is one hundred and six carats, and by competent judges it is regarded as the purest of precious stones.

The value of the crown-jewels of England has been recently estimated by a royal commission. The crown weighs nineteen ounces ten pennyweights. It does not contain the Koh-i-noor. From the gold circle to the upper cross it measures seven inches, its diameter being five inches. Its present worth is as follows:

The ruby.....	£10,000
The aqua marina.....	12,000
Twenty diamonds round the circle.....	30,000
Two centre diamonds.....	4,000
Four crosses, each composed of twenty-five diamonds.....	12,000
Four diamonds on tops of crosses.....	40,000
Twenty-six diamonds in <i>fleur de lis</i>	12,000
Diamonds on arches.....	14,000

£134,000

N. S. DODGE.

AMERICAN PATRONYMICS.

SCHUYLER COLFAX SCHPRECHSELHEIMER is probably the title of some incipient citizen of the West, whose father feels a sensation of pride when reflecting that he helped to elect "Krant and Coalbox."

Here we have a Dutch *prænomen*, an English *nomen*, and a German *cognomen*, combined to form one American appellation—an instance of the remarkable character and construction of our names.

In examining the subject of our patronymics alone, we also find many points of interest. In the first place, we have received by inheritance many of the peculiarities that attended the nomenclature of the British and Dutch settlers in the original thirteen colonies. These are very curious in themselves. For instance, we find names spelled exactly alike, but pronounced in various ways, and held by

some of their bearers to be totally different in derivation and meaning. Thus we find Mr. Smythe disavowing all connection with the plebeian Smith, whose descent from a *smelter* of metal not covering human flesh is far too plain; and it is said that in the east of England there are people, otherwise rational, who actually spell their name *Smijth*, and disclaim any relationship to either of the others. So, also, we hear of Dixons who profess to be altogether separate from the common herd of Dicksons. They stoutly maintain that Dixon is a Hispanized form of Dijon; for, say they, *x* and *j* are the same in Spanish, and Burgundy is not very far from Spain. Whether or not the family was of old seized and possessed of the town, and allowed it, as a favor, to take their name, does not appear.

Mr. Bowditch, in his valuable and attractive work on "Suffolk Surnames," gives us much information respecting the names most common in Boston and its vicinity, touching also upon some cases belonging to other localities. Indeed, this work, while presenting its facts in the most amusing and entertaining manner, probably exhausts the particular branch of the subject of which it treats. And, as the surnames of the colonists on the Atlantic coast were, except in New York, almost entirely British, the work applies, in a great measure, to the names of the whole country. It is true that the Norman element seems to prevail in Virginia to a greater extent than in most other States; but this does not make a very material difference.

The most striking features of our patronymic system, however, take their origin from another source. They are distinctively American, and have been produced by the extraordinary mixture of diverse elements that has been and is still taking place on our soil.

The sign-boards of foreign tradesmen in the streets of our cities make those thoroughfares look like portions of a great world's fair. But, while they present a source of much interest to the philologist, the ordinary passer-by looks upon them as combinations of many consonants and few vowels (in most cases), for which he can see no kind of reason. The German names are, according to the popular view, bad enough, and seem, with their frequent use of *schw*, *ch*, *pf*, *dt*, etc., to be fearfully and wonderfully made. The length of their names, also, constitutes a pet grievance of the average American. Smith, Jones, Brown, and Cox, cannot see why any man should "go to work and call himself" Priesterjahn (a name redolent of the middle ages, with their wondrous stories of the Abyssinian king), Schnaupfenschmacher, or Von der Loewenhofenstein.

The German Jews, however, with their gorgeous appellations, descriptive of blooming mountains, valleys of roses or lilies, flowery fountains, and streams of love, have been able to present titles which, if not appropriate, are certainly not ineuphonious or hard to pronounce.

But it is against our Slavonic and Hungarian fellow-citizens that the injured American has the strongest case to present. They are to him a sad stumbling-block, and he has been known to wax eloquent thereupon. If he knew that in the Magyar language *sz* is simply our *s* (that letter, with them, being equivalent to our *sh*), he would, perhaps, look upon Szemelenyi with less disfavor. So, also, if he knew that *cz* is the Polish and Bohemian way of conveying the sound of our *ch*, and that their *w* resembles the English *v*, it might mitigate his wrath at seeing the sign of Mr. Wladimir Czernikowski.

As it is, after partially recovering from a strong sense of personal injury, he proceeds to do the best he can about pronouncing it. His laudable efforts in this direction remind us of the laborious attempt once made by the French Assembly and the Paris papers to compass the name of Schiller. M. Regnier, in his "Œuvres de Schiller," tells us that the Assembly of 1792, in conferring the title of French citizen on the German poet, converted his name into *Giller*. The *Moniteur* thought this too French to be correct, and so changed it to *Gilleers*. The *Bulletin des Lois*, utterly unable to comprehend this, fell back upon *Monsieur Gille*. With this indorsement on it, the letter went the round of the German post-offices, and reached the poet five years afterward, when his opinion of the French Revolution had entirely changed.

Our supposititious American does not have much better success. He gets up some kind of substitute, however, and the foreigner is obliged to receive this in lieu of his proper name, and be known by it always afterward. This seems to have been the actual origin of many apparently anomalous names, now common in various parts of the United States.

In some portions of the country, particularly in Pennsylvania,

numbers of German names have become Americanized. Thus, *Albrecht* has become Albert or Allbright; *Rüppert*, or *Ruprecht*, Rupert; *Mueller*, or *Müller*, Miller; *Hauck*, Houck; *Hofmann*, Hoffman; *Schneider*, Snyder; *Kraemer*, or *Krämer*, Creamer; *Grünebaum*, Greenbaum; and *Baumgärtner*, Bumgardner.

In many cases of this kind the naturalized form is really a complete or partial translation of the original German name. But this generally occurs where there is a similarity of sound as well as of meaning, as in the names *Müller* and *Grünebaum*. Sometimes, too, these Teutonic patronymics bear some resemblance to English words of totally different signification; and the change, in such instances, produces a singular effect. For example, there are, in the Shenandoah Valley of Virginia, persons of German descent, named Neiswanner, who seem to be in considerable danger of acquiring and retaining, instead thereof, the rather extraordinary designation "Ice-water."

The Knickerbocker names form a singular exception to the rule. They have, with a few exceptions, retained, not only their proper spelling, but also the true Dutch pronunciation—the peculiar sounds of *oe*, *uy*, *sch*, etc., so characteristic of the Dutch language, being notably preserved. Markoe is still *Marcoo* in sound, and Schuyler has never ceased to be *Skylar*; while Ten Broek and Van Rensselaer are pronounced very nearly as of old. This is probably owing to the fact that these names were commonly known in *Nieuw Nederlanden* when the English first came there, and consequently the new-comers adopted and transmitted to posterity the pronunciations that had already become established.

The American names of French extraction have also, in many cases, kept their proper spelling. Their sound, however, has almost invariably been altered, and some have been corrupted in both respects. The aristocratic De Rosset, though allowed to keep its form, is pronounced *Derazit*; Deveraux is called *Debro*; and the Gallic Jacques must submit to being addressed as *Jakes*.

The *modus operandi* employed in the construction of these popularized French names may be illustrated by an incident that occurred during our late war. When Colonel D'Epineuil's zouave-corps of French residents went to join the Army of the Potomac, the people in the districts through which it passed inquired of the men, as usual, what regiment it was. One individual, in particular, was assiduous in gaining the desired information. Having obtained it, he came back, with the look of one conscious but not proud of his superior knowledge, and finally, in answer to numerous inquiries, condescended to explain that they were the "Death-knell Zouaves."

The freedmen of the South, particularly those of the cotton-growing States, many of whom possessed but one name before the war, have since had an opportunity to indulge their tastes in the selection of such as suited them. Many have taken the titles of their former owners; and quite a large number, also, have appropriated that of Mr. Lincoln, of General Grant, or of some other prominent man on the Federal side. Some, however, have given full sway to their fancies, and have selected titles that are, to say the least, thoroughly original. It is probable, therefore, that we shall hereafter meet with whole families belonging to this race who rejoice in the somewhat ambiguous appellations of Coonskin, Possumcatcher, Turkeyfoot, or Christmasday.

But to what a condition will American surnames be brought when the "coming man," the veritable "Shon" himself, shall consummate his much-talked-of advent! Verily, O Koopmanshaap, you will have much to answer for!

Your true Mongolian, of course, considers his pig-tail and wooden shoes a spectacle at which the ignorant and degraded inhabitants of this uncivilized country ought to be duly edified. With the dulcet sounds of his musical language, also, he expects us to be much impressed; and the idea of his actually exchanging his own melodious name for one common among the outside barbarians would strike him with horror. In California and Nevada the signs of Hop Long and Ah Chung are quite familiar, while the celestial clothes-dealer displays over his door the appropriate title Try On. A Californian tradition tells of a travelling painter who was engaged by a prominent Asiatic washer and ironer to paint him a sign whereby men should know that Kt-tz-kitchou-whang (being a little rusty in my Chinese, perhaps I am not exactly right about the name; but it was something of that pleasing nature) there conducted the laundry-business in the most supreme, ineffable, and celestial manner. The result was, that a sign was painted,

and the Missouri artist, pocketing his fee, left his patron contemplating, with pride and satisfaction, the legend: "You bet! On it! All right! Hunky dori!" The sign attracted swarms of people, who seemed to Kt., etc., of a singularly hilarious nature; but, as his became the most popular laundry in the neighborhood, he felt disposed to cheerfulness himself.

The Irish names we meet do not generally present much difficulty in their pronunciation, because, it would seem, many of them had become Anglicized in Ireland—as, Dermot for Diarmuid, etc. Some, however, have been changed here. McGeech is called McGew, which is evidently the result of an attempt to master the proper sound of the Erse *ooh*; and Gallagher has become variously Gallagher, Gallaheer, and Galliar.

The Welsh immigrants have principally settled together in some particular locality, and consequently their names are not very widely met with, except in one or two instances. Still, we sometimes encounter, besides the well-known Owens, Jenkinses, and Griffiths, such apparent phenomena as Merlynwyllynwodd, Ap Hwg, and Ap Trepoldwll. The knowledge that the Welsh *w* is a vowel, and that the syllable *dud* is pronounced *doodle*, makes these names rather more intelligible, but hardly more euphonious.

Occasionally we meet a name that seems to have been considered rather too hard a specimen to be allowed, and so, by general consent, its pronunciation is more or less, sometimes even entirely, changed. A singular instance of this exists in the vicinity of Richmond, Virginia. A man, possessing the name of Enroughty, has it so displayed on his sign, and always writes it in that manner; but, when he is asked how it is pronounced, he answers, "Darby." Everybody in the neighborhood calls him Darby, and, if called on to write or spell it, follows the orthography on his sign. They seem, too, to be quite surprised at the idea of a stranger seeing any thing peculiar in this arrangement.

This brief notice of some of the elements that take part in the formation of our names may serve to attract attention to the subject of American patronymics. It is, without doubt, one fraught with much interest even to the general reader; while to the philological, ethnological, or historical student its importance is considerable. This is certainly the time, too, for the collection of reliable information with regard to the surnames of our country. At present it is quite easy to trace out the sources of the various titles, and to account for most of the changes in form or sound that have taken place. But, after a comparatively short period shall have elapsed, so many corruptions and interminglings will have occurred that, without some data of the kind now easily obtainable, the topic will be full of difficulties and uncertainties. It is greatly to be desired, then, that this opportunity be taken to collect and preserve materials for information of this nature, which, in the future, will certainly possess a high degree of interest and value.

W. W. CRANE.

WATER-SNAKES.

ALTHOUGH the existence of the great American sea-serpent may be reasonably doubted, it is a fact, well known to all seamen, that water-snakes are found in many parts of the world, though principally in the tropics.

Along the southern coast of Asia, in the waters that wash the shores of Hindostan, Siam, and the Malaccan Peninsula, they are in great abundance, averaging from three to six feet in length, and some of them present the same variegated hues that adorn so many tropical fish with all the colors of the rainbow. I classify these snakes with fish because there are many peculiarities common to both. Like the fish, these snakes are furnished with gills, seek in the water for their food, will bite freely at a baited hook, and are capable of living for a long time, if not wholly, in the water. I have frequently met with them out of sight of land, and that this was no casual circumstance, is proved by the fact that they were swimming about in large numbers, hundreds of them being in sight at the same time. When not darting about after their prey, they generally swam along with their head and neck erected nearly perpendicular, at an elevation of from six to twelve inches above the water. In order that the reader may obtain a better idea of them and their habits, I will describe a scene as it actually occurred.

At the time, I was attached to one of our government vessels, bound on a mission with a special minister to perfect old treaties, or make new ones, with the semi-barbarous powers of Southern Asia and the East-Indian Archipelago. During the passage up the Gulf of Siam, our ship was becalmed near the island of Pulo Oby, about three hundred miles from our destined port. The morning was fine and clear, not a breath of wind stirring, and the water so still that there was no perceptible motion to the ship—in fact, a perfect tropical calm.

The water around us was literally alive with snakes of every imaginable hue. Some were darting along with the sinuous motion peculiar to their species, flat upon the water; but the greater number were nearly motionless, with head erect, as before described. Looking at those some distance off, it gave one the idea of an innumerable quantity of sticks, from two to four inches in diameter, floating perpendicularly, with their upper ends a few inches above the surface of the water.

Our scientific corps, consisting of three surgeons, the hospital steward, and two loblolly boys, immediately abandoned the interesting work they had been engaged in that morning, and hurried on deck, where nearly all hands were already gathered viewing the wonderful and unusual scene. I may add, that they had been trying to poison an old monkey of a peculiar species, whose skin they wished to preserve in good order. As often as the vessel, containing arsenic, was handed to the old brute, she would drink the contents down and hand it back for more. Finally, after swallowing enough to have killed fifty men, without being affected by it, she was drowned in a tub of water.

But let us return to the snakes. Every possible means was devised to capture some of them, scoop-nets, harpoons, buckets towing astern, slip-nooses trailing from yard-arms and jib-boom, but all in vain—they were too active and agile. If caught in a bucket or net, they sprang out before reaching the deck; some were cut in two by the harpoons, and they all seemed to have as much horror of the noose as would a condemned murderer. At last somebody suggested trying a hook and line, and soon a dozen or more were towing overboard from every available part of the ship.

These efforts were not immediately crowned with success, and the surgeon applied for a boat, in order that he might try his scoop-nets at close quarters, but this the old commodore peremptorily refused, for the snakes were supposed to be poisonous, and two or three of them jumping about in a boat full of men, might produce fatal consequences. The men were ready for the fun, but, as subsequent events proved, it was well that the commodore remained firm.

Finding that salt meat, for bait, was useless, for the snakes frequently came up and smelled of it without biting, a chicken was killed and one hook supplied with a morsel. Scarcely had it touched the water when there was a rush, a splash of many-gleamed light, and in a few seconds the first victim was landed on deck. Here he jumped around furiously, but did not seem to possess the power of locomotion that his land-brethren have. The first proceeding was to test the question of poison. The armorer, furnished with a large pair of blacksmith's tongs, caught the snake firmly just back of his head, and with a pair of pincers pulled out the hook. A chicken was then brought and held so that the snake could close his jaws upon him just under the wing. A quick bite was given, though the snake's neck was still firmly held in the tongs.

The surgeon had more success with this unfortunate fowl than he had been favored with in the case of the monkey, for in less than four minutes it was lying dead on deck. More hooks were now baited, and soon a dozen snakes were secured, the largest one being five feet nine inches long, and fourteen inches in girth around the body. The others were of different lengths, but the average was about four feet.

When brought aboard, the armorer's tongs and a sharp knife being brought into requisition, they were soon rendered harmless, and their bodies placed in spirits for future scientific observation. These snakes all bore a general resemblance to the common fresh-water eel in every thing excepting color, which was as variable as that of the dying dolphin.

Old sailors sometimes spin yarns about these snakes getting aboard of ships at anchor, by worming their way up along the cables and entering the hawse-holes, but such yarns may be classed with those concerning "the great American sea-serpent," and the manufactured monster of Silver Lake.

H. W. DODGE.

TABLE-TALK.

IT is amusing, sometimes, to look back and see the sort of stuff that was palmed upon our fathers as literary criticism. About half a century ago, for instance, there was published at Philadelphia a *Monthly Review*, whose editor seems to have aimed at making a sensation by "sloshing round" generally. He attacked and ridiculed nearly all the prominent authors of the day, beginning with Byron, who was then at the height of his popularity. He described the noble poet as a man whose "heavy volumes of stanzas have pestered the world—a mere titled rhymester;" the "author of a mass of hobbling, teeth-grinding poetry;" the "major portions of whose writings possess not the smallest particle of the soul of poetry;" and closes his "criticism" by lumping the merits of Byron in this summary passage: "That in the multiplicity of his lordship's writings we should, by dint of industrious research, discover some easy-flowing passages and brilliant ideas, is not much to his credit; for we can find the same things in the dull heroics of Sir Richard Blackmore." Finally, Byron is advised, in 1824, just before his death, to quit poetry, wherein he is so deficient, and turn his attention to prose, in which he might hope for decent success. The death of Byron evidently gave the reviewer great delight; it "left the world for him to bustle in." "Woe now," he wrote exultantly, "to those wittings, his admirers and imitators, who mistake rhymes for wit, the great Dagon of their idolatry is no more. Well may they raise the ul-ul-loo; he who bullied the crowd into the reading of bad English; who inflicted upon men of good taste the penance of perusing hobbling numbers and false rhymes, has withdrawn from his exploits. Bellow forth, ye rugged verse-lovers, till you split your lungs with lamentations! Stiff, unwieldy couplets, or barbarous Spenserians, made the vehicles of unnatural quaintness or affected originality of ideas, have no longer a sprig of nobility to dignify them, or give them attraction to the unreflecting multitude." Kindred opinions with these were entertained by the same critic of Sir Walter Scott. He spoke of him as an "unknown Scotchman," and of the *Waverley* novels as "slovenly and stupid productions, abounding with affected sentimentality, blackguards and scoundrels, common as thistles in a Scotch glen; with sheepish heroes, footballs to every one that might choose to kick them. The sooner the 'Great Unknown' ceases to write his blundering works, the better will it be for himself and the public." Washington Irving was described, very much to the annoyance of the gentle Geoffrey, who had not been used to such rough handling, as a "scribbler of skim-along, trim-the-hop, popinjay prose, whose writings abound with heavy, disagreeable matter, betraying throughout little merit but imitation." Many of Irving's sketches he pronounced "absolutely silly, fit only for the pages of two-penny primers, to amuse children. What lesson do they teach? What information do they convey? What impression do they make? We cannot see their value. . . . Mr.

Crayon's style reminds us of a boy moving awkwardly on stilts, who is straining every nerve to prevent a downfall." Next to Washington Irving, Fenimore Cooper was peculiarly obnoxious to this Philadelphia censor, who had novels of his own in preparation, and was doubtless jealous of all competitors. Cooper's "Pioneers" was pronounced "unwieldy, slovenly, ungrammatical," and, "as a story, entirely destitute of interest." "The Pilot" suffered the same fate. The popular American poets of the day did not escape the visitations of the profound reviewer. Halleck was pronounced "an inveterate doggerellist;" a "man capable of throwing the most common and contemptible ideas into metre." Sprague, Percival, and even Bryant, were treated with equal contempt. Nobody appears to have been praised. As the editor, however, had a novel, called "The Wilderness," in press, and ready for publication, he sought to conciliate the most formidable of our then existing critical journals by vigorously puffing the *North American Review*, which was pronounced an admirable journal. He said of it: "We have found a spirit of candor, and a vein of good sense to pervade the work, which induces us to esteem it one of the most useful publications of the day." But just as the number of his *Review* containing this puff was about to appear, the *North American* came out with a notice of "The Wilderness," which was condemned as trash, and the exasperated novelist immediately inserted in his magazine a furious article on "The Degeneracy of the *North American Review*," which began thus: "In the leading article of our present number, we complimented this *Review* for the honesty which it had hitherto displayed in its animadversions on authors. When we committed that compliment to paper, we were far from expecting that we should so soon have to change our opinion. The sheet containing it, however, was hardly printed off, when the *Review* for the present quarter fell into our hands, and afforded decisive and melancholy proof that it no longer continued the honest and able journal of criticism we have so long esteemed it."

— William Henry Burleigh, who died in Brooklyn, New York, on March 18th, had attained distinction, not only as a journalist, a politician, and a graceful and effective public speaker, but as a poet of decided ability. He was a lineal descendant of Governor Bradford, of the Plymouth Colony, and on both sides of a cultured and intellectual ancestry. His father was an eminent teacher, and nearly all his brothers have attained distinction as orators, poets, or preachers. He was born in Woodstock, Connecticut, in February, 1812, was educated in the Plainfield Academy, of which his father was for many years principal; at the age of seventeen, was apprenticed to the printer's profession, and a year later commenced contributing to a newspaper, on which he was employed. After a year or two more of schooling, devoted mainly to the study of the best English literature, he again turned his attention to printing, and soon occupied the editorial chair. From 1833 to 1855, he was actively engaged as a journalist, usually being both editor and proprietor of his periodical, and sometimes conducting two

simultaneously. At the very outset of his career, he became active in the antislavery, temperance, and peace movements, and advocated their principles with great boldness and eloquence. The causes he advocated were at first intensely unpopular, even in New England, and he suffered more than once, in person and property, from mob violence. But, while he was bold and unflinching in his advocacy of what he regarded as the right, he had no love of controversy for its own sake. A man of a genial, loving, sensitive, and intensely poetic nature well versed in English literature and fond of literary pursuits, he would have greatly preferred never to taste the bitter waters of strife, but to be left to his favorite studies in peace. Even during the fiercest years of the antislavery struggle, he turned aside more than once to start and put in circulation purely literary periodicals, to which his contributions, both in prose and poetry, were singularly sweet and gentle, and entirely free from the smoke and stain of the bitter contest he was waging. When the principles for which he had been so long contending had triumphed, he gladly withdrew from political journalism, and devoted himself to literary pursuits and the duties of an office to which he was appointed by the Governor of the State. He had attained a considerable reputation as a lecturer during his political career; and, when he felt at liberty to turn his attention to general themes, he was very soon greatly in demand as a public speaker before lyceums, institutes, and college societies. He possessed rare qualifications for this work—a melodious and well-modulated voice; a graceful elocution; a style not too ornate, but certainly never heavy; a large fund of appropriate illustrations; and a fixed purpose to convey instruction as well as amusement. Whether his reputation as an orator, a poet, or a man of letters, shall live after him, is of little consequence; but he will assuredly be long remembered as an honest, earnest, and able man. His surviving children inherit their father's abilities, and two of them have already made themselves a name in art and literature.

— The portrait, on our first page, of William, the German Emperor, is from the latest photograph published in Berlin, and represents him in the official costume of his new rank, concerning whose proper insignia there has been so much discussion in Germany of late that the imperial private secretary has been compelled to publish a notice that his majesty declines to receive any more communications on the subject. At this distance, however, we can hardly comprehend why there should be any discussion at all, or any question about the matter. We presume the emperor considers himself as simply the successor of the old German emperors whose costume and insignia are well known, the insignia having been preserved at Vienna since the fall of the old empire in 1806, when Francis II., the last emperor, resigned the German crown and took the title of Emperor of Austria. The imperial crown of Germany is of gold, about a foot high, and heavily set with pearls. The sceptre is of silver, gilt, and two feet long. The globe carried in the hand is of the finest gold, three and seven-eighths

inches in diameter, and encircled by two rings, one perpendicular and half-covered with jewels, and the other horizontal and entirely encrusted with gems. On the top is a cross which blazes with precious stones. These insignia, we presume, will be used at the coronation of the emperor, as they were at those of his illustrious predecessors. In No. 81 of the *JOURNAL* we published a sketch of William and his career, from which we recapitulate the following outline: He was born at Berlin, March 22, 1797. His mother, Queen Louisa, died, sixty years ago, broken-hearted, it is said, at the humiliations which Prussia had undergone at the hands of the first Napoleon. If this be so, her son has mightily revenged his mother's grief and his father's abasement on the house of Bonaparte; for he has led captive the heir of their enemy, and has swept the race of the Napoleons from France. He was educated in the military school, and has been a soldier from childhood, his first experience in war having been gained under Blücher in the campaigns which terminated at Waterloo. He became king in 1861 by the death of his brother, Frederick William IV., and in the following year had the good sense and the good fortune to make Otto von Bismarck his prime-minister. The statesmanship of Bismarck and the military genius of Moltke have made his reign illustrious, and elevated him to the first rank among the princes of the Old World. He revises the German empire in a blaze of glory, and in person and character is himself no unworthy representative of the stern and stalwart kaisers of the middle ages, who in their day were the acknowledged chiefs of Christendom.

— A few years ago the monotonous style of roof used in our architecture was agreeably varied by the introduction of what is known as the Mansard roof, sometimes called the French attic. The splendid architectural piles in Paris received some of their best graces of expression from the handsome sky-lines the Mansard roof gave them, and almost every American travelling abroad wondered why so graceful a roof could not be adopted in our American cities, where the large buildings usually terminated with an abrupt, sharp, and unpicturesque sky-line. The Mansard roof after a time was introduced, and its peculiar beauty soon made it very popular. But, like all fashions which become the rage, and which are adopted by people imitatively, without perception of the principle that governs them, the French attic has become with us an architectural infiction. The Mansard roof was designed for tall buildings. Its special purpose is to break the monotony of a massive pile, and to reduce in appearance its real height. A structure that would seem awkwardly tall, with an unvaried succession of stories, has not only, by means of the Mansard roof, a more graceful caption, but attains more agreeable proportions. The specific purpose of this roof being recognized, the absurdity of its use in small buildings becomes at once apparent. Our builders, however, seem to lack all power of perception, and to have reduced the art of architecture to indiscriminate imitations. Everywhere now the Mansard roof confronts us.

Every new cottage on the road-side, new cheap villas in those extemporized villages that line our metropolitan railways, new public buildings of every sort and degree, railroad station-houses all over the country—every thing of the kind now, no matter if only a story high, must have its Mansard roof, with entire disregard of fitness or propriety. It is exasperating to see a good idea thus dragged into absurd and ignoble uses. As we at first hailed with pleasure the appearance of the Mansard roof, we shall now look with hope for the signs that will indicate the termination of its career. And yet, whatever may follow it will have to undergo the same experience. It is our natural way to try and appropriate every big thing for every little purpose.

— The best route to the beautiful mountain-region of North Carolina is by way of the East-Tennessee and Virginia Railroad to Morristown, Tennessee. Colonel C. E. Evans, 303 Broadway, can give those desirous of going to the mountains all necessary information about them, and the mode of getting there.

Literary Notes.

THE sale of books in Spain during the reign of Queen Isabella II. was exceedingly small. Thus, more copies of Fernán Caballero's novels, which were more popular in the Peninsula than those of any other contemporary Spanish romancists, have been disposed of since the downfall of the daughter of Maria Christina than previous to that event.

Messrs. Longmans have in press a work by Mr. J. Murray-Graham, which, from its title, promises to be one of some interest, viz., an "Historical View of Literature and Art in Great Britain, from the Accession of the House of Hanover to the Reign of Queen Victoria."

Rudolph Gottschall, the most eminent of the literary critics of Germany, says that Paul Heyse, of Munich, is the most versatile of German authors. He has written dramas, epics, romances, and novelettes, and all of them are equally good.

Seventy-eight thousand copies of Auerbach's "Village Stories" have been sold by his German publishers. Besides, several German reprints have been issued in Belgium and Switzerland, and also had a large sale.

The late Queen of Sweden wrote half a dozen volumes of novels and travelling sketches, besides a number of poems, which were published in the collection of the poetical works of her husband.

Over four hundred manuscripts of books on the war were offered for publication to a leading book-firm in Leipzig during the last eight months. Of these four hundred manuscripts six were accepted.

After many fruitless efforts to find a publisher, Louis Kossuth has abandoned his project to issue his autobiography. It is a work in five volumes.

The Viceroy of Egypt, to whom Louisa Mühlbach sent a copy of her "Travels in the Orient," was so well pleased with it that he sent her a costly set of diamond jewelry.

Professor Carl Bartsch, of Heidelberg, one

of the most learned linguists of Germany, has translated Homer's "Iliad" into the language of the Nibelungen Lied.

A decree of the Russian Minister of the Interior prohibits the publication of Ivan Turgueneff's novels in the columns of the daily papers.

Mr. Morris is publishing a translation of the "Frithiof Saga" in one of the magazines. Besides this Saga, Mr. Morris has translated three other Sagas from the Icelandic.

The "Chemical Cyclopædia," on which Justus von Liebig is now at work, will form twelve large volumes.

Alfred Tennyson will travel this summer in Denmark and Sweden. So says the *Copenhagen Dagbladet*.

There are five German translations of Longfellow's poems, and eight of Tennyson's works.

Scientific Notes.

Professor Agassiz and his Museum.

IN his address before the joint committee of the Massachusetts Legislature, asking for further endowment for the Museum of Comparative Zoology at Cambridge, Professor Agassiz said: "The museum has done something toward improving science in America. Twenty-four years ago I was present at a meeting of the American Association for the Advancement of Science, held in Cincinnati, where specimens from all parts of the West were brought together to be seen by the scientific men of the East, to be appreciated as evidence of the progress made in science in America. When one of the members of the Association moved that to make the best use of these collections they should be sent to Europe to be identified by paleontologists and zoologists of the Old World, to be returned to us as standard specimens for future advancement, I opposed that motion as earnestly as I could, stating that it would be an acknowledgment of inferiority on the part of America, from which we could never rise again; that there was already a beginning in scientific matters in the East which would make it possible to have those things worked out as well in America as they could be abroad. My motion was carried, and yet I remained under the imputation, which was loudly expressed by some, that I had carried a big job; that my motion had been made in order that I might have the benefit of describing those specimens, and thus raise my reputation. I resolved then, to myself, but never spoke of it before, that I would never describe an American fossil, and I have kept my resolve. The progress since then has been such that now an American student scouts the idea of sending a piece of work to a European ordeal. That is what the museum has done for America. . . . I am old enough to be beyond all false modesty. I feel that I can do some service, and I have the most intense desire to do it. My whole thought is wrapped up in that museum, and I will tell you why. When I saw the importance of such an institution, I considered very carefully what was the wiser thing for me to do—to go on writing or to devote my energies to building up a museum. I had then published two volumes of my contributions to the natural history of the United States. They met with much favor, such as no work of a similar kind has ever received in this country. To continue the work

would have been the source of great income to me, but I thought I could do more good building up a museum. It is eight years since I have left off writing. It was not a want of desire to make contributions as to science, or to rival the scientific men of Europe, who look upon me as though I had gone to sleep in the United States, and as though my usefulness had been wasted in popular efforts. I thought I knew what I was aiming at when I was trying to secure the lead in the progress of science to my adopted country, and I am just in a position which is the most critical of my life. A liberal help will place me in a position to complete that work within the time I may hope to live. Small help would bind me to do what cannot be done under those circumstances, and it would also prevent me from doing that kind of literary work for which I have some ability. So now, gentlemen, I appeal to you to be generous to your own public institutions."

The *Astronomische Nachrichten* says Professor Struve, of Pultowa, has been for years watching the rings of Saturn; and the inner one of the three rings, an obscure, partly-transparent mass of what appeared to be vapor, has been seen to approach the body of the planet, and to widen its distance from the other rings, which seemed to be fluid in character, or perhaps made up of myriads of small bodies, moving together like the streams of meteors which supply the periodic showers. But, during several months past, this inner ring has fallen more rapidly, and finally the attraction of Saturn entirely overcome the centrifugal force, and it closed upon the body of the planet, forming a belt, which was gradually diffused over its surface, so that there is now no trace whatever of the ring left. Is this to be the fate also of the other rings, or will they ultimately gather into satellites, as has more commonly been supposed?

The observations taken on Mount Washington during the past winter have established one important fact, that the periods of intense cold are felt at the high altitude from twelve to twenty-four hours sooner than they are in the country below. Careful observations are made at Hanover, New Hampshire, to be compared with those on the mountain, and others are made at points nearer Mount Washington, at Gorham, Whitefield, Lunenburg, Vermont, etc., either in connection with the expedition or for the Smithsonian Institution at Washington. A comparison of all the observations will probably disclose other meteorological facts than the one referred to above.

Can a turkey-buzzard be deceived by his sense of smell? This question having been somewhat discussed, a correspondent writes to the *American Naturalist*, citing Audubon as one of his authorities, that both the turkey-buzzard and the black vulture are practically incapable of distinguishing odors, and select their food by the sense of sight alone. He adds that they feed upon fresh meat as readily as upon putrid flesh.

Foreign Items.

EX-MINISTER ROUHER was in a pitiful condition when he arrived at the jail in Arras, after the rough treatment he had undergone at the hands of the mob in Boulogne. His coat was torn, and his head was covered with a fatigue-cap, which a private soldier had given him after he had lost his hat. It was only by dint of hard begging that the once all-powerful minister of Napoleon III. prevailed

upon his guard, during the journey from Boulogne to Arras, not to handcuff him. At all railway stations where the train stopped, crowds of excited men and women were assembled, and fierce imprecations were uttered against Rouher.

The Swedish Minister of Justice has matured a scheme for the punishment and reformation of criminals, by which the penitentiaries in that kingdom will become entirely superfluous. Convicts, according to this scheme, will be bound for service to manufacturers, farmers, etc., who will pay two-thirds of their wages to the government, and one-third to the convicts at the expiration of their term. Only murderers and incendiaries will be imprisoned in the casemates of the royal fortresses—the former for life, and the latter for a term of from two to fifteen years.

It has now been ascertained that the Grand-duke of Mecklenburg-Schwerin, who commanded an army-corps during the war in France, committed so many inexcusable blunders in that capacity that General Moltke had finally to insist peremptorily on his removal. The grand-duke was so mortified at it that he was taken sick, and is said to be in danger of becoming a confirmed hypochondriac.

They say at Stuttgart that the Queen of Württemberg, Czar Nicholas's favorite daughter Olga, intends to separate from her husband on account of serious disagreements about political affairs. The queen is violently opposed to Prussia, and her royal husband, since the breaking out of the war, has become an ardent admirer of Bismarck and King William.

The erection of magnificent new university buildings is in contemplation at Berlin. They will be the largest of any designed for that purpose in the world. It is believed that ten years from now from eight to ten thousand students will attend the lectures at the University of Berlin.

The private secretary of the Emperor William I. has published a notice that his majesty has been overwhelmed with suggestions in regard to the imperial insignia by artists, antiquarians, and others, and that he will not receive any further communications on the subject.

The Paris *Figaro* is offered for sale at one-fifth of the price which was asked for it in June, 1770; it then had a circulation of between sixty and seventy thousand copies, which has now dwindled down to less than twenty thousand.

The Pereire brothers, the well-known bankers of the second empire, live in great style at Geneva. Their real estate in France has been seized by the creditors of the Credit Mobilier.

The watering-places in Southern France were nearly deserted during the winter. At Cannes, which formerly always was crowded, only seven of the villas were occupied by strangers.

Gounod, the composer of "Faust," is bitterly denounced in the French papers for having written a letter of thanks to the Crown Prince of Prussia, who had saved Gounod's country-seat from destruction by the Bavarian troops.

The Turkish Sultan is so exasperated at the course recently pursued by Great Britain in regard to the Oriental question, that he has determined to remove all Englishmen holding prominent positions in the Turkish service.

The Czar of Russia has pardoned all the Polish ladies who were sent to Siberia on account of their participation in the insurrection of 1863.

Two grand-nieces of Maximilian Robespierre still live at Arras. Their name is Lefranc. Robespierre's relatives assumed that name after the restoration of the Bourbons.

It is said that Offenbach has received more money for his operas than Meyerbeer and Rossini obtained together for their grand operas.

The scientific societies in Germany are collecting funds for a valuable testimonial to be offered to Professors Bunsen and Kirchhoff, the inventors of spectral analysis.

It is a curious fact that the essay which Prevost-Paradol, the late minister of France to the United States, recited, when graduating at college, was "On Suicide."

Charles Victor Hugo left a fortune of two hundred and fifty thousand francs, which he accumulated by speculations in railroad bonds.

Anton Rubenstein and Joachim, the two greatest European virtuosi on the piano and violin, will visit the United States next fall.

The widows of Prussian officers, killed in the service, receive a pension of two hundred thalers a year.

The three Empresses of Russia, Germany, and Austria, and the Queen of Denmark, are suffering from consumption.

The ex-Empress Carlotta has recovered her physical health, and there are said to be some hopes that she will recover her reason.

Marshal Leboeuf is going to Italy, where he will be appointed by King Victor Emmanuel chief of the royal artillery.

It will cost over two million francs to repair the damages caused during the war in the crypt of the Kings of France at Saint-Denis.

The last direct descendant of Field-Marshal Blücher has recently died of wounds received at the battle of Gravelotte.

There are three vacancies in the French Academy, and it is understood that Emile Ollivier will resign his seat.

Ernest Renan is in Brussels, the guest of the Princess Mathilde Demidoff.
